THE NEW INTERNATIONAL ENCYCLOPÆDIA

MUNICIPAL GOVERNMENT. The outstanding feature in municipal government from 1914 to 1924 was the rapid advance of the commission-manager plan, which was only fairly well started at the beginning of 1914. A rapid increase was made in numbers and population of incorporated places in the United States; their services, rendered at public expense, were continually augmented; and there was a consequent increase in municipal expenditures, indebtedness, and tax rates. All three increases were accelerated by the War and post-war conditions during the 10 years. No true picture of these increases can be gained without taking into account the diminished purchasing power *of the dollar and the greatly increased commodity* and construction cost index. Besides the movement of cities toward the adoption of the commission-manager city charter, other changes were made, to effect more efficient municipal government and at the same time to make it more responsive to the wishes of the people. Where the commission or the commission-manager plan, with its small governing body, had not been adopted, there were many changes to councils of much smaller size than formerly, with abolition also of the bicameral or two-chamber city council where that was still in existence. The most notable example was the substitution at Philadelphia on Jan. 1, 1920, of a single council of 21 members for the old double-chambered council of 144.

The census of 1920 showed that the 50 largest cities of the country had a population of nearly 38,000,000. The 50 largest cities of the United States in 1870 had a total population of 5,773,000, or only 153,000 more than the population of New York in 19[illegible]. In 1870 the United States had only 14 cities of 100,000 population or more, compared with 68 in 1920. Up to and including the census of 1870 the dividing line between urban and rural population was 8000. By 1880 urban life had become so much more intense that the urban classification was extended to embrace all incorporated places of 2500 population and over, and all towns of that size, in certain New England States. On this basis the urban population of the United States on Jan. 1, 1920, totaled 54,300,000, or 51.4 per cent of the entire population of the country; these people lived in 27[illegible] places. Smaller incorporated places, each functioning municipally to a greater or less degree, numbered 12,905 in 1920 and had a population about 9,000,000. For 1924 it is safe to assume some 16,000 incorporated places with a total population of about 65,000,000, or nearly 60 per cent that of the entire country. A preliminary statement by the Bureau of the Census reporting taxes collected in 1922 and 1912 shows that incorporated places of more than 2500 population collected a total of $1,532,000,000 taxes in 1922 against $850,000,000 in 1912, an increase of 80 per cent. The corresponding figures for taxes levied by counties are $745,000,000 and $308,000,000, an increase of 142 per cent. The net debt of cities (gross-debt sinking-fund assets) for all incorporated places in the United States was $4,709,000,000 *or $70.80 per capita in 1922, against* $2,885,000,000 or $54.07 per capita in 1912.

Charters and Municipal Home Rule. One by one the various State Legislatures of the Union have given up the early and long-prevailing practice of enacting separate charters for individual cities. In some places it is still within the power of a Legislature to do this, although the power is rarely exercised. A number of State constitutions prohibit all legislation applying to one city only. Some years ago New York State made such legislation subject to local veto by the mayor or in smaller places by the local legislative body. New York in 1914 and Massachusetts in 1915 passed optional charter acts under which municipalities can by popular vote choose between six types of charter in New York and four types in Massachusetts. The three main types in each State are the federal or mayor-and-council type, with varying degree of separation between legislative and executive functions; the commission plan, and the commission-manager plan. In 1915 the voters of New York State defeated municipal home-rule amendments to the State constitution which had been drawn by a constitutional convention. After persisting in an attempt to the same end, New York State in 1924 became the thirteenth in the Union to grant more or less extensive home-rule powers to its municipalities. The New York home-rule constitutional amendment was adopted by a popular majority of 426,000 at the November election in 1923. The necessary enabling act specifying the details of home-rule powers and methods of exercising them was passed by the Legislature of 1924 and ap-

proved by Governor Smith on April 24. The amendment added several sections to Article XII of the New York State constitution, which makes it the duty of the Legislature to provide for the government of municipalities.

The Enabling Act (Chapter 303, Laws of 1924) extends broadly to all kinds of strictly local legislation, including the making and amending of municipal charters, but leaves unaltered the power of the Legislature to pass certain kinds of laws applicable to all municipalities. The amendment also authorizes the Legislature to pass special legislation by a two-thirds concurrent vote of each house, on receipt of an emergency message from the Governor. Every city is granted constitutional "power to adopt and amend local laws not inconsistent with the constitution and laws of the State." These laws may relate to a wide range of subjects. The amendment makes it the duty of the Legislature to provide by general law for putting the amendment into effect. The Enabling Act authorizes any local legislative body to pass local acts superseding existing State legislation applying to the municipality in question alone The act makes compulsory a referendum vote on certain charter changes and local ordinances such as those changing the veto power of the Mayor, creating a new executive office, abolishing a branch of the legislative body, or alienating city property. Other kinds of local acts are subject to referendum on petition. Provision is made for local drafting of new charters. The municipal assembly is prohibited by the Enabling Act from passing any law removing or raising debt or tax limits and various other matters retained under State control. In the case of New York City and in recognition of the large legislative powers vested in the Board of Estimate and Apportionment, the Enabling Act gives the power to enact local laws to a bicameral body known as the Municipal Assembly, consisting of the Board of Estimate and Apportionment and the Board of Aldermen. Before they are approved by the Mayor, he must give a hearing on all local laws passed by the Assembly. The Mayor's veto of such laws may be reconsidered by the Municipal Assembly and passed over the veto by a two-thirds vote On reconsideration the Mayor is not allowed to vote. The New Jersey Legislature of 1923 granted to any municipality in that State the right to adopt the commission-manager form of city charter. A plain commission plan enabling act was passed some years earlier and had been widely adopted in the State, but repeated efforts to secure the manager plan were defeated.

CITY MANAGER CITIES

(From *The City Manager Magazine*, April, 1924.)

The following represents the growth of the manager plan by years.

Put in effect	By charter	By ord.	Total
1908	0	1	1
1912	1	2	3
1913	8	3	11
1914	15	6	21
1915	13	7	20
1916	15	5	20
1917	13	5	18
1918	20	8	28
1919	20	11	31
1920	23	12	35
1921	41	7	48
1922	28	10	38
1923	40	8	48
1924	6	1	7
1925	1	0	1
1926	1	0	1
Totals	245	86	331

Rapid Progress of City-Manager Plan. Up to 1914 the city-manager plan had been adopted by only 23 municipalities; the first of these was Staunton, Va., which created the office of business manager by ordinance in 1908 From 1915 on, there was first slow and steady and then more rapid progress in the adoption of the manager plan. The official *Year Book of the City Managers' Association* for 1924, revised to March 15, showed that 319 municipalities in the United States and Canada and 7 in foreign countries had adopted the manager plan. Of the 319 cities, 246 had adopted the plan by charter and 73 by ordinance. The charter method is considered the better of the two because it is more stable and rests on the referendum vote.

The population of cities operaing under the city-manager plan in 1924 was nearly 5,000,000 in the United States, 130,000in Canada and 470,000 in other countries. The largest American city under the plan was Cleveland, Ohio, with a 1920 population of 797,00. Other American manager cities with popultions in excess of 100,000 in 1920 were: Norfolk, Va., 159,000; Dayton, Ohio, 153,000; Grand Rapids, Mich., 137,000. By far the large number of manager cities are relatively small. The largest foreign city listed in the *Year Bok* already mentioned is Leeds, England, with a population about 430,000. The total number of manager cities given does not include those that have abandoned the plan. Of thes, there are altogether 76 that were reported as having adopted the plan, but of that numbe the reports were unfounded in many cases. Of the 76 cities, 72 either never really adopted the plan or else adopted and abandoned it uner ordinance. The plan has been abandoned by only 4 cities that adopted it under charter. he largest of these was Akron, Ohio, which adopted a manager plan not wholly as standard in 920 and gave it up four years later. The ther charter cities which abandoned the manager plan are Waltham, Mass., Hot Springs, Ark., nd Lawton, Okla.

Promotions of city managers have been common, with 72 instances. Up to Mar. 15, 1924, the *Year Book* already cited states that 259 managers were serving in their first cities, 30 in their second, 5 in their third, in their fourth, and one in his fifth. The over 13 of the 72 promotions were of men not now following the profession of city manager. The leading managers command high salaries, not always proportioned to the populson of the city. There were, however, many managers giving good service at modest salaries. In 14 cities the salaries paid to managers were $10,000 or over. Cleveland, Ohio, where the plan went into effect Jan. 1, 1924, pays $25,000 a year Norfolk, Va., and Stockton, Cal., pay $20,000; their respective populations in 1920 were 159,000 and 40,000 In the $15,000 class were Knoxville, Tenn., with a population of 78,000, and Sacramento, Cal., with a population of 66,000. Pasadena, Cal., and Lynchburg, Va., pay $12,000 a year. The cities in the $10,000 class were Long Beach, Cal.; Miami, Fla.; Dubuque, Iowa; Portland, Me.; Beaumont, Texas; Petersburg, Va.; and Bluefield, W. Va. The last named had the smallest population of any in the $10,000 class—16,000.

See CITY PLANNG, GARBAGE, MUNICIPAL OWNERSHIP, SEWERE, WATERWORKS.

MUNICIPAL LEAGUE, NATIONAL. An organization founded in 1894 for the study of municipal problems and the dissemination of information on the subjects relating to them. The society was active in the decade 1914–1924. Annual meetings are held in different cities. The twenty-first meeting was held in Dayton, Ohio, in 1915. During this year several important volumes were published, including *Lower Living Costs in Cities*, by Clyde L. King; *The City Manager*, by H. A. Toulmin, Jr. In 1916 the meeting was held in Springfield, Ohio. There was an important discussion on the influence of politics in city government. Lawson Purdy succeeded W. W. Foulke as president. The meeting in 1917 discussed many other subjects, including the experience of American and Canadian cities during war time. A survey commission to examine different phases of municipal government was appointed, as was also a Conference of State Leagues of Municipalities to act as a separate organization. Lawson Purdy was reëlected president. In this year the society published many other volumes, including *Municipal Functions*, by H. G. James. The session of 1918, held in New York City, gave the major part of its time to the discussion of various phases of Bolshevism. In November of the same year, a conference on reconstruction was held under the auspices of the society, in Rochester. In 1919 the meeting at Cleveland took the form of a moot constitutional convention, at which sundry questions on constitutional reform were discussed at length. Clinton Rogers Woodruff retired as secretary after twenty-five years of service. He was appointed honorary secretary. Hon. Charles E. Hughes was elected president at this meeting In Indianapolis, in 1920, the society discussed the report of a commission on State government. President Hughes delivered an address on the fate of the direct primary At this meeting the society voted to unite with the American Civic Association. H. W. Waite was elected president. A feature of the meeting in Philadelphia in 1922 was an address delivered by Albert Shaw on the history of the work of the society, entitled *A Thirty Years' View*. A committee on electoral reform was appointed at this session. At the meeting in Washington, in 1923, many phases of municipal government were discussed. Through its committee on State government it has prepared a Model State Constitution which was debated and accepted at three successive annual conventions. The constitution is published in pamphlet form with explanatory articles. The League has also prepared a number of pamphlets designed for classes in high schools, and many others on technical subjects. Its official organ is *The National Municipal Review*, monthly. The secretary is H. W. Dodds.

MUNICIPAL OWNERSHIP. Waterworks lead public utilities in percentage of plants under municipal ownership and even more markedly in percentage of population supplied. All of the 10 largest cities of the United States own their works. In the second group of 10 all but San Francisco and Indianapolis, and every one in the third group of ten, have them under public ownership. In cities ranging from thirty-first to fiftieth in population, all but six have municipally owned works. There are only nine examples of private ownership in the 50 largest cities of the country. In the second group of 50 cities, only six have them under private ownership. Out of the 100 largest cities, 15 had private-owned works. No figures for the whole country have been compiled since those given in the *McGraw Waterworks Directory* for 1915. Of 4400 works there listed for the United States, a number probably too small to include all works then built, 3045, or nearly 70 per cent, were municipally owned. For Canada, figures published by the Canadian Conservation Commission in 1915 showed that of 528 waterworks, 396, or about 75 per cent, were under municipal ownership. In some of the provinces, all of the works were publicly owned. Denver, Colo., after many years of effort and agitation to that end, acquired its waterworks from private owners in 1918. San Francisco, which had also been struggling for municipal ownership for a long time, had not succeeded up to 1924 in taking over the distribution system, but had completed what was formerly known as the Hetch Hetchy Dam and now called the O'Shaughnessy Dam, to form a large impounding reservoir on the Tuolumne River. It also had well under way the construction of a large aqueduct from the reservoir to the city. (See AQUEDUCTS and DAMS.) Extensive hydroelectric power development is a part of the project, and this is also true of the water supply brought to Los Angeles by a notable aqueduct. A notable event in 1923 was the transfer on December 15 to the city of Morristown, N. J., of the waterworks originally built in 1799 by the proprietors of the Morris Aqueduct. By this transfer there passed to municipal ownership the last of 15 privately owned waterworks in the United States built up to the close of the year 1800. On the date last named there was in existence only one municipally owned waterworks in the United States, at Winchester, Va.

Next to waterworks in public ownership in the United States stand electric light and power stations. A summary published in the *Electrical World* of Aug. 11, 1923, based on the 1923 edition of the *McGraw Central Station Directory*, shows that on Oct. 1, 1922, there were in the United States 5974 central station systems; of this number 2019, or 33.7 per cent, were municipally operated. The largest number of municipal central stations was reported from the west north central States, in which of 1460 stations, 693 were municipally operated.

Gas works in the United States make a very small showing for municipal ownership. According to figures compiled by the American Gas Association, based on the 1923 edition of Brown's *Directory of American Gas Companies*, of 966 gas works in the United States in 1923 only 51, or 5 per cent, were municipally owned, and the plants under municipal ownership supplied only 1.6 per cent of the total output of gas for the year to less than 2 per cent of the entire population supplied by gas; 662,000 population were supplied by municipally owned works out of a total of 45,000,000 people served. The 51 municipally owned gas works were located in 21 States, with six in Minnesota, five in Virginia, and four each in Georgia, Iowa, and Massachusetts. The largest of these was that supplying the Omaha metropolitan district in Nebraska; this was taken over by the district in 1920. The two next largest were at Richmond, Va., and Duluth, Minn.

Street railways are but rarely under munici-

pal ownership in the United States, but more commonly in Canada, and still more generally in Great Britain. In point of magnitude of works and capital investment, the subways and other railways forming part of the rapid transit system of New York City lead the country. These, however, are privately operated, and so are the municipally owned subways and elevated lines of Boston and Philadelphia. Important extensions to the New York and the Philadelphia rapid transit systems were still under way and projected in 1924. Within the preceding decade, San Francisco, Seattle, and Detroit went extensively into municipal ownership of street railways. San Francisco had either built or acquired by purchase over 60 miles of single track up to June 30, 1923. Seattle on Mar. 1, 1919, took over by purchase from the Puget Sound Traction Light and Power Company 203 miles of railway track at a purchase price of $15,000,000; this had been authorized by a popular vote of 4 to 1 in November, 1918. Detroit acquired an extensive street railway system.

In Canada, 15 municipalities have gone into municipal ownership of street railways. The entire street railway system of Toronto was under municipal ownership early in 1924 and some suburban lines also, although the latter were operated by the Ontario Hydro-electric Commission. Sewerage systems, though not usually regarded as a public utility, i.e. subject to private franchise and operation for private property, are owned by a few cities in the United States, the chief of which is Atlantic City; they are similarly owned in some foreign countries, as in the city of Valparaiso, Chile. The Public Ownership League of America, with national headquarters in Chicago, is devoted to the promotion of public ownership and democratic control of public utilities and natural resources and issues various bulletins on the subject.

MUNICIPAL TAXATION. See TAXATION IN THE UNITED STATES.

MUNITIONS OF WAR. See ORDNANCE.

MUNSEY, FRANK ANDREW (1854–1925). An American publisher (see VOL. XVI). During the decade 1914–24 he was especially active in the newspaper field and established and acquired by purchase several newspapers, including the Washington *Times*, Baltimore *News*, New York *Sun*, New York *Globe*, New York *Mail*, New York *Evening Telegram*, and New York *Herald*. The last he sold in 1924 to Ogden Reid, who consolidated it with the New York *Tribune*.

MURDOCK, VICTOR (1871–). An American legislator (see VOL. XVI). In 1917 he was appointed a member of the Federal Trade Commission. He was reappointed for the term expiring 1925. During the War he served as a member of the meat commission of the United States government. From 1914 to 1916 he was chairman of the Progressive national committee. He wrote *China, the Mysterious and Marvelous* (1920), and *Folks* (1921).

MURMANSK COAST EXPEDITION. See RUSSIA, *History*.

MURRAY, (GEORGE) GILBERT (AIMÉ) (1866–). A noted English philologist (see VOL. XVI). He has published since 1914 *Stoic Philosophy* (1915); *Faith, War and Policy* (1918); *Euripides and His Age* (1918); *Satanism and the World Orders* (1920), and *Problems of Foreign Policy* (1921).

MUSCLE SHOALS. A location on the Tennessee River 2.7 miles above the railway bridge at Florence, Ala., and a few miles from Sheffield. During the War the United States put under way a notable development there for the manufacture of nitrates for use in military explosives and also a large power plant involving the construction of a hundred-foot dam across the river. (See DAMS, *Wilson Dam.*) Under the terms of the National Defense Act of 1916 the site for the dam at this point was acquired, and in the following year United States Nitrate Plants No. 1 and No. 2 were planned, the latter directly at Muscle Shoals. This was done in order to secure an adequate supply of nitrate for the manufacture of munitions in case the United States should be cut off from the material imported from Chile. The reason for locating such plants at Muscle Shoals was the great power to be obtained from the Tennessee River, the fourth in size of the rivers of the United States, having a flow of 8000 to 500,000 cubic feet per second and in this vicinity a fall of over 134 feet in 37 miles. The Tennessee River is navigable from its mouth to the foot of Muscle Shoals, and the completion of the No. 2 or Wilson Dam at this point with its lock and the construction of No. 1 Dam, a small dam for navigation only two miles below the Wilson Dam, would extend navigation for a distance of 15 miles. The building of the proposed Dam No. 3, 50 feet high, would extend navigation 65 miles further and supply additional power Up to 1924 navigation of the river had been slight, but much interest centred in the development of power, particularly at Dam No. 2, the Wilson Dam Here for 12 months in the year there would be available 87,300 horse power and for 97 per cent of the time 100,000 horse power, while for 2½ months the available power would increase up to 600,000 horse power. The United States No 2 Nitrate Plant at Muscle Shoals was completed so that operation could begin on Oct. 27, 1918, and it continued for a sufficient time after the Armistice to show that it could be run successfully. It had a capacity of 220,000 tons of cyanamid or 110,000 tons of ammonium nitrate per annum. This plant was of course operated by steam power; there is a 60,000 kilowatt steam-power plant at Muscle Shoals. Electricity was supplied over a 90-mile transmission line from a 30,000 kilowatt steam plant on the Warrior River. The plant at Muscle Shoals cost approximately $70,000,000 and the Warrior River plant and transmission line about $5,000,000 additional. The raw materials required for nitrogen fixation were coke from the Birmingham district or eastern Tennessee, limestone from the Waco quarry, 30 miles distant, and nitrogen from the air. The principal item was the cost of power; 85,000 kilowatts was required, and the steam plants were used pending the completion of the large dam across the river. The No. 2 plant could supply the nitrogen for 12 infantry divisions at the rate it was used in the War, or more than one-third of the inorganic nitrogen used in the production of fertilizers in the United States at this time. Consequently in the latter connection after the end of the War the farmers became interested in the utilization of the plant as an agency to increase the supply and decrease the cost of fertilizer. Accordingly after the War the future of this great power and manufacturing development became a matter of considerable debate. After a curtailment of construction

work on the Wilson Dam in 1921, it was decided to proceed vigorously with its completion, but no decision was reached as to the method of utilizing the power that would be developed, up to the autumn of 1924. Offers were made by Henry Ford, the Combined Power Companies, in which the Alabama Power Company was a leading interest, a Mr. Hooker, and the Union Carbide Company, all of whom submitted to the government detailed proposals of plans for the utilization of the present and future power resources, the manufacturing of fertilizer, and the conditions under which it would be sold. The Ford proposal for a while attracted much public attention, but it was not altogether favorable to the government according to many engineers. The various schemes were all under discussion in 1923 and 1924, but the question of disposing of the government-owned property at Muscle Shoals was not definitely decided at the session of Congress ending June 7, 1924, although at that time the sentiment was rather in favor of the government's retaining and operating the property than of turning it over to Henry Ford to operate. There also were changes in the aspect of preparedness in this field as well as in the production and cost of fertilizer materials so that the conditions seemed to indicate that the power consideration might be preëminent over other considerations.

MUSIC. At the outbreak of the War, futurism was just making its appearance, and the majority of musicians, as well as music-lovers, then regarded the new movement as an aberration of taste not worthy of serious consideration. The decade 1914–24, however, witnessed such a rapid and general spread of the new cult that futurism was no longer to be ignored. To understand the situation at the close of this period it is necessary to distinguish between impressionism and futurism. Impressionism began as a reaction against the all-pervading influence of Wagner. For the fundamental principle of thematic development the impressionists substituted the mere statement of themes, which followed one another in kaleidoscopic succession, without systematic repetition or development. But the necessity of themes as basic material was still recognized. The conscious employment of the higher overtones, while extending the possibilities of harmonic combinations and progressions for the attainment of special effects, was carried to excess from the very beginning, with the result that impressionistic music rests not on the foundation of consonance, which was formerly the foundation of all music, but on dissonance. Around Debussy as their leader, a group of younger composers sprang up who soon made a caricature of impressionism and whose tendencies were dubbed futurism. These innovators, dispensing altogether with thematic invention, employed mere rhythmical figures. Regularly defined rhythm was soon scorned as monotonous, and constant variation of rhythm was adopted as a fundamental principle. Different instruments played different rhythms simultaneously, so that each instrumental part was entirely independent of all the others. This brought with it the complete and intentional disregard of the harmonic relations of sounds. The preponderant use of dissonance by the impressionists had already obliterated the dividing line between euphony and cacophony, and now the futurists denied the essential difference between consonance and dissonance, proclaiming a system of "free harmony" which permitted the combination and juxtaposition of all sounds, irrespective of relationship. This system frankly adopted cacophony as its basic principle. As compositions were no longer written in a recognizable tonality, key signatures disappeared and each accidental was marked individually, with the result that the printed page is as bewildering to the eye as the actual sounds to the ear. This method of writing soon became known as atonalism. However, some futurists insist on a distinction between atonalism, the negation of the diatonic scale and the triad, and polytonalism, the superposition or interlocking of various tonalities. Thus, in a string quartet by Casella the first violin plays in E♭ minor, the second violin in B♭ major, the viola in F♯ minor, and the 'cello in D minor. The constant change of rhythm quite naturally led to the abolition of time signatures and bar lines. The next step was the introduction of quarter-tones; the scores of Alois Hába were actually published in the new quarter-tone notation. The craze for novel effects also led to an abnormal augmentation of the mechanical means of sound-production. Orchestral instruments were exploited in unusual registers and in still more unusual combinations. As an extreme example of overloaded orchestration may be cited Schönberg's *Gurrelieder*, scored for 6 solo voices, 2 choruses of eight and 12 parts respectively, and 114 different orchestral parts—altogether 140 distinct parts! In the employment of this huge apparatus, Schönberg defeats his very purpose and produces less startling and grotesque effects than Stravinsky does in his *Histoire du Soldat*, scored for an absurdly inadequate orchestra of one violin, one clarinet, one bassoon, one cornet, one trombone, and several drums.

The outbreak of the War created conditions exceedingly favorable to the spread of futurism, especially in Europe. It happened that impressionism had already made great headway in Russia, England, and the Latin countries, whereas in Germany and Austria the traditions of the classic and romantic masters had proved an effective check against the new influence. With German music banished, or at least considerably curtailed, in all countries politically arrayed against Germany, the impressionists assumed undisputed leadership, and in their wake the futurists developed such an active campaign that in a very short time they succeeded to the dominating position. Debussy, who until the beginning of the War had been the acknowledged leader of the radicals or ultramodernists, was deposed as too conservative, and his place taken by the futurists Skriabin and Stravinsky. The futurists now became the ultramodernists, while the impressionists were relegated to the rank of mere modernists. In Germany and Austria the new gospel began to spread, and Schönberg, whose partisans before the War had made some futile attempts at recognition, suddenly found himself elevated to a place by the side of Skriabin and Stravinsky. As early as 1915 an Italian, Pratella, formulated the new futuristic creed: "Young composers, revolt against the tyranny of the publishers, the stupid presumption of the public, and the insipid gossip of critics all more or less bought. . . . Let us attack the prejudice for music that is well made, and despise that popular phrase, 'We must go back to older music.' . . . Let us destroy the

popular taste for old operas, whose exhumation encumbers the progress of new musicians. Let us compel the public, by assiduous propaganda, to be interested in all that teems with originality and revolution in music. . . . We hear on every side that we are fools. It is from the window of a glorious madhouse that we proclaim as an essential principle of our futuristic revolution that counterpoint and fugue, foolishly considered one of the most important branches of musical instruction, are no more in our sight than the ruins of the old science of polyphony that extends from the Flemish masters to Bach. . . . We declare, moreover, the values of consonance and dissonance as absolutely inconsistent. From innumerable combinations and from the diverse relations that result from them will arise the great futuristic melody. This melody will be simply the synthesis of harmony and in a way will resemble the ideal line formed by the continuous expanding of a thousand sea waves with irregular crests. . . . We have liked for a long time the enharmonic intervals produced by an orchestra that sounds out of tune in playing on diverse tonalities and that we hear in popular songs intoned without any knowledge of art. The rhythm of the dance will have to renounce the domain of polyphony for a free polyrhythmic manner. . . . The æsthetic intuition of the creative artist will be sufficient to balance the succession and alternation of all tempi and of all possible rhythms. . . . The musician ought to listen only to his soul singing in synthetic explanation of his musical ideas. . . . The purely symphonic composer writes at the pleasure of his fantasy, neglecting all principles and laws, to obey only the futuristic equilibrium. . . . We must be careful not to consider as absolute symphonic forms the traditional schemes of the symphony used to-day, which are decayed and surpassed. . . . We must express the musical soul of the multitude, of the great industrial factories, of trains, transatlantic steamers, warships, automobiles, and aëroplanes. We must add to the great dominant motifs of the musical poem the glorification of the machine and the victorious kingdom of electricity. . . . All this will become possible when conservatories, lyceums, and academies of music will finally be deserted and closed, and when the study of music will have taken the character of absolute liberty." This programme was accepted by most futurists, irrespective of nationality.

After the War the new movement continued throughout Europe with unabated vigor. A host of writers now appeared who effectively aided the composers, and in almost every country were established periodicals devoted exclusively to the cause of futurism. Through these persistent and systematic efforts a new public was recruited, sufficiently numerous to insure the success of a futuristic festival held in Salzburg in August, 1922. The immediate result of this festival was the formation of the International Society for Contemporary Music (I. S. C. M.), with headquarters in London, for the purpose of spreading the new cult by means of annual festivals. At the first official festival, which took place according to schedule at Salzburg in August, 1923, 35 composers of 14 different nationalities were represented on the programme.

On the older composers whose reputation had been firmly established early in the century, the War seems to have had a blighting effect. Strauss, Puccini, Elgar, and Sibelius were not silent, but they produced in the decade 1914–24 not a single work even remotely approaching the best of their earlier efforts. In fact, the beginning of their decadence antedated the outbreak of the War by several years. Different is the case of Rachmaninov, by all odds the greatest of living Russian composers, who suddenly, without having given any indication of declining power, deserted the career of the creative artist for that of the virtuoso. If these men of pronounced individuality, whose earlier works have permanently enriched the literature of music, were unable to stem the rising tide of futurism, it is vain to hope for any counteracting influence from men of lesser ability, who almost without exception exhibit some phase or other of futurism.

In the musical development of the United States during the decade futurism played a secondary rôle. Futuristic tendencies, it must be admitted, were quite noticeable among the younger American composers; but as yet, with the exception of Leo Ornstein, these manifestations avoided the furthest extremes and could still be regarded as advanced Impressionism. The chief reason why the influence of these composers on the public taste was negligible is the conservative attitude of the general public and of our great musical institutions, whose programmes, in the main, were still drawn from the works of recognized masters. While impressionists had frequent hearings, futurists were represented but sparingly, and only very rarely by extreme works. Of the musical centres, New York, the most important, is also the most conservative. Bach, Beethoven, Schubert, Brahms, Wagner, and Tchaikovsky still held undisputed sway, and despite determined efforts on the part of certain conductors, the New York public had not yet become convinced of the merits of Bruckner, Mahler, or Reger. This state of affairs led a small group of futurists to establish, in 1921, the International Composers' Guild for the purpose of producing exclusively works of extreme tendencies, because "the standard symphony orchestras present only the most timid and anæmic of contemporary productions, leaving absolutely unheard the composers who represent the true spirit of our time." In spite of very active and noisy propaganda this group made few converts, and the works produced at their special concerts did not find their way to the programmes of our recognized institutions. Although since the beginning of the century there had arisen in all parts of the United States numerous composers whose efforts had been duly recognized and encouraged by the leading orchestras and choral societies, they had not succeeded in reaching their common goal, the creation of a national school of music that should be recognized as typically American. Numerous and earnest attempts to force such a consummation by means of prizes, competitions, and special organizations producing exclusively works of native composers had not yielded the expected results. Nevertheless, the efforts put forth by this generation of composers were by no means futile; they were preparing the soil from which, at some future day, will spring the longed-for national art. Until the outbreak of the War, Berlin had been the centre of the world's musical

activity. American artists seldom risked appearances in their own country unless they had met with approval in a Berlin début. In this respect a complete change took place within the decade, so that a New York début had come to be a passport not only for American artists, but also for many a European aspirant. As a natural consequence of the War a vast number of the world's most famous interpretative artists sought and found success in extended tours of the United States The presence of so many celebrities at the same time compelled managers to extend the field of operation, so that even smaller towns were visited, with the result that interest was stimulated throughout the country. Tangible proof of this new interest is found in the large number of newly established musical organizations of all kinds in towns which had formerly never considered such institutions a necessity.

Chamber Music. The widespread interest in chamber music throughout the United States during the decade furnishes conclusive evidence of the steadily growing appreciation of the best music. In all parts of the country numerous new organizations not only had been formed but also successfully maintained themselves. The most notable event was the establishment of the annual Berkshire Festival, which was inaugurated Sept. 16–18, 1918. During the summer of 1917 Mrs F. S Coolidge began the erection on South Mountain, near Pittsfield, Mass., of the Temple of Music, a small concert-hall with a seating capacity of 500, to be devoted exclusively to the performance of chamber music. At the same time she offered a prize of $1000 for the best string quartet to be performed at the inaugural festival Not less than 82 manuscripts, many from European composers, were submitted. After the success of the first festival the $1000 prize was made a regular feature. The programmes of the festivals are given by famous chamber music organizations from all parts of the Union. On two occasions European quartets participated, the London String Quartet (1920) and the Stuttgarter Streichquartett (1922). The programmes offered were remarkable for variety and catholicity of taste, favoring no nation and no period, and ranging from Bach to the moderns of the day. At the conclusion of the festival of 1922 announcement was made that the cash prize thereafter would be awarded biennially, in the even years. In the odd years new works were to be commissioned from prominent composers. The first composers to be honored with such commissions were Eugene Goossens (string sextet) and Rebecca Clarke (*Rhapsody* for 'cello and piano), both performed at the festival of 1923. The list of prize winners was as follows: 1918, Tadeus Iarecki, string quartet; 1919, Ernest Bloch, suite for viola and piano; 1920, Francesco Malipiero, string quartet; 1921, H. Waldo Warner, piano trio; 1922, Leo Weiner, string quartet; 1924, Wallingford Riegger, *La Belle Dame Sans Merci*, for vocal quartet and chamber orchestra. An event that should not pass unrecorded is the dissolution of the famous Kneisel Quartet, which played its last concerts at Boston (Mar. 13, 1917) and New York (April 3). Founded in 1886, with Franz Kneisel, Otto Roth, Louis Svecenski, and Fritz Giese as its original members, it played 32 consecutive seasons in Boston and 25 in New York, besides making numerous tours of the United States and two of Europe. Its influence in practically creating and then cultivating taste for chamber music in America can scarcely be overestimated. For many years it had enjoyed the reputation of one of the finest quartets in the world.

Community Music. Community music, at least as the term had come to be understood, was a direct result of the War. Previously there had existed, especially in Philadelphia and Chicago, isolated associations of factory workers organized into choral societies, some of which had attained sufficient proficency to appear in public concerts. During the War the soldiers, under regular leaders, were trained in choral singing, and this practice developed a genuine liking for music. Many ex-soldiers, after return to civil life, communicated the enthusiasm aroused in them by the camp songs to their fellow workers, with the result that in an incredibly short time employees of the larger companies in many industrial centres banded together for the cultivation of singing. Community choruses sprang up even in the smaller towns and villages throughout the country. The interest in music was not confined to singing; it immediately embraced the field of instrumental music, and numerous amateur orchestras and bands were established. By the end of 1920 the Bethlehem steel workers had recruited from among their own numbers not only a large chorus but also a complete symphony orchestra of almost 100 players. In the same year the employees of the Federal Reserve Bank in New York gave a complete stage performance of *The Bohemian Girl* without the assistance of an outsider even in the principal rôles or orchestra. In some of the larger cities, where musical appreciation naturally had been spread before the War, the new movement led to the establishment of community opera (Washington, Philadelphia, St. Louis, Cincinnati). In 1920 New York celebrated its first Music Week (February 1–7), when all musical organizations, churches, hotels, theatres, and many individuals combined to bring music in some form or other home to everybody. At the Grand Central Palace an exhibition of musical instruments was held throughout the entire week, with lectures and recitals. The interest aroused was so general that Music Week was made a regular annual institution, and a permanent committee of eminent musicians was appointed. The example was followed immediately by almost all neighboring communities, who had their Music Week before the end of the year. Within three years the idea had been adopted by the entire country. This widespread interest in music induced several municipalities to appropriate public funds for furthering various musical projects. Baltimore established a special department of Municipal Music, St. Louis a municipally subventioned summer opera, Chicago and Philadelphia municipal symphony orchestras, etc. In New York a movement was on foot in 1924 for the erection of a municipal conservatory, and the Musical Alliance of the United States had launched a movement for the establishment of a ministry of fine arts and a national conservatory in Washington.

Festivals. After the sudden interruption of the performances in the summer of 1914, the theatre dedicated to Wagner in Bayreuth remained closed for 10 years. During 1923 Sieg-

fried Wagner gave concerts in many German cities, raising funds for the restoration of the theatre and the resumption of the performances. For the same purpose he made a concert tour of the United States early in 1924. In the summer of 1924 the festival was resumed (July 22–August 20) with performances of the *Ring* dramas, *Meistersinger*, and *Parsifal*. After 1914 the chorus of the Bethlehem (Pa.) Bach Festivals was gradually augmented, until in 1924 it numbered 250. Up to 1920 the programmes had been selected exclusively from the choral works of Bach, but in that year instrumental works were included. The innovation was received with favor and was adopted as a fixed policy. In 1917 the chorus participated in a Bach-Beethoven festival in New York arranged by the Philharmonic Society, and in the following year in a Bach-Wagner festival of the Symphony Society.

Albert A. Stanley, conductor of the Ann Arbor festivals since their inception (1893), resigned in 1921 and was succeeded by Earle V. Moore. An annual festival lasting four days was founded in Newark in 1915 by Mortimer C. Wiske and conducted by him thereafter. At the North Shore Festival in Evanston, Ill., a prize of $1000 was established in 1921. It was to be awarded annually for the best orchestral score submitted by an American composer, the successful work to have its first performance at the festival and then to be included in one of the regular concerts of the Chicago Symphony Orchestra during the following winter. The winners were Camille Zeckwer with *Jade Butterflies* (1922), Felix Borowski with *Youth* (1923), and Charles M. Loeffler with *Memories of Childhood* (1924). For the first time in its history, the annual festival at Worcester, Mass., was omitted in 1918, on account of an epidemic of influenza that swept the eastern States in the fall of that year. There was no festival in 1922, because the time was permanently changed from September to April. Arthur Mees resigned as conductor in 1919, and was succeeded by Nelson P. Coffin, who died shortly before the festival of 1923. The latter was under the direction of Arthur J. Bassett and J. Vernon Butler. In 1924 Henry Hadley was elected regular conductor.

Mechanical Reproduction of Music. There is not the least doubt of the fact that the introduction and rapid perfection of the player-piano and phonograph contributed in a large measure to the development of the public taste for better music. The former had been brought practically to perfection even before the War. This is true of the Welte-Mignon Duo-Art and Ampico reproducing pianos, which differ from player-pianos in that they faithfully reproduce that subtle quality termed the individuality of the artist. On Dec. 10, 1918, the Chicago Symphony Orchestra performed Saint-Saëns's concerto in G minor for piano and orchestra with Harold Bauer as soloist. The latter, however, was not actually present, but was represented by his Duo-Art record. At a concert of the New York Philharmonic Society (Apr. 23, 1919), the soloist, Leo Ornstein, sat motionless on the stage listening to his own reproduction of the first movement of Mendelssohn's Concerto in G minor, after which he took his seat at the instrument and played the remaining movements in person. In records for the phonograph, the decade witnessed a tremendous improvement. It may be said that up to 1914 satisfactory records had been made only of solo voices or solo instruments. The accompaniment, whether for piano or orchestra, left much to be desired in regard to clearness and proper balance with the solo part. Reproductions of choruses sounded blurred, while orchestral records failed to reproduce the timbre of the different instruments. Especially wonderful was the progress made since then in the reproduction of orchestral masses, so that in the best records a practiced ear can detect such subtle differences in timbre as between an oboe and an English horn. Almost all the great symphony orchestras had played for the recording companies. One great problem, however, still remained for the manufacturers to solve. So far no one had succeeded in reproducing the real, resonant tone of the piano; even the best records sounded as if the artists were playing on a harpischord or a harp.

Almost from the day of its inception broadcasting by radio became an important factor in the dissemination of good music. The first concert heard over the radio was broadcast by Station KDKA in Pittsburgh, on Nov. 3, 1920, and soon stations all over the country were broadcasting music. The beginning was made with dance music and popular songs of the day, but before long, in response to numerous requests, symphony concerts and entire operatic performances were broadcast. The demand for the better music rapidly assumed such proportions that managers, especially those of famous artists, fearing a decrease of attendance at concerts, inserted a clause in all contracts restraining their artists from giving their services gratis. Composers and publishers also began to demand payment of the usual fees on all works controlled by them. These demands the radio companies declared themselves unable to meet, as they derived no income whatever from the host of listeners The result was that during the last months of 1923 there was a decided dearth of good music transmitted by radio. However, frequent conferences of representatives of the American Telephone and Telegraph Company (Station WEAF, New York) and of managers and musicians finally resulted in the appointment of a committee who issued a general appeal for voluntary contributions from interested listeners. The public responded quickly and generously. With a considerable fund at hand a plan was worked out for the broadcasting of concerts of famous stars, beginning with the opening of the concert season in the fall of 1924.

Opera. The history of opera during the decade is a record of almost feverish activity barren of any artistic results. Of the enormous number of new works produced in all the opera houses of the world, especially after the Armistice, not one achieved an emphatic and general success promising an addition to what may be termed the standard operatic repertoire. The vast majority of these novelties did not even outlive the year of their original production. Of the two foremost living dramatic composers, Puccini brought out *La Rondine* (1917) and the triptych *Il Tabarro, Suor Angelica, Gianni Schicchi* (1918); Strauss, a revised version of *Ariadne auf Naxos* (1916) and *Die Frau ohne Schatten* (1919), winning in each case only a *succès d'estime*. To the already formidable list of his failures Mascagni added *Lodoletta* (1917)

and *Il Piccolo Marat* (1921). The more prominent among the composers whose works survived for several seasons and were heard in more than one city were d'Albert, with *Die Toten Augen* (1916; in the United States, 1923), *Die Revolutionshochzeit* (1919), *Sirocco* (1921), and *Mariecken von Nymwegen* (1923); Pfitzner, *Palestrina* (1917); Schillings, *Mona Lisa* (1915; in the United States, 1923), Zandonai, *La Via della Finestra* (1919) and *Giulietta e Romeo* (1922). On May 1, 1924, the much heralded and long delayed première of Boito's *Nerone* actually took place at La Scala, in Milan What had excited international interest in this event was the fact that for the last 25 years there had been constant reports of all kinds regarding this work, of which no one, not even the composer's intimate friends, had seen or heard a note. Expectation had been raised so high that nothing less than a masterpiece of Wagnerian power could have survived the ordeal. The consensus of critical opinion was that the première was a "magnificent failure." In spite of the fact that in the United States opera received a large share of public attention, New York and Chicago were still the only cities supporting a permanent operatic institution Other cities were dependent on short visits from traveling companies, some of which, especially the San Carlo Opera Company and the Society of American Singers, were notable for the excellence of their ensemble. The taste of the general public showed a decided preference for the standard works, so that the production of novelties was left almost exclusively to the two permanent organizations. Neither of these institutions was fortunate with new works; not one of their novelties maintained itself in the repertoire. The fiasco of the only futuristic opera attempted so far, Prokofiev's *Love for Three Oranges*, by the Chicago company (1921), was such as to deter American managers from further experiments in this line, at least in the immediate future.

Chicago Opera Association. After the death of the general manager, Cleofonte Campanini (1919), his duties were divided between H. M. Johnson and Gino Marinuzzi, as executive and artistic director respectively. Complications arising from this dual directorship led, early in 1921, to the appointment of Mary Garden as sole director. Under her management the friction became even more acute, and a deficit of $800,000 at the end of the season brought about the dissolution of the company (1922), after 12 years of splendid artistic achievement. Immediately the Chicago Civic Opera Company, with Samuel Insull as president, was organized and acquired all the properties and practically the entire personnel of its predecessor. While there was no change in regard to artistic policies, a radical departure in administration was inaugurated by vesting the executive power in the finance committee rather than in a single individual. Giorgio Polacco was made artistic director.

During the War the works of Wagner had been excluded from the repertoire. In 1920 *Lohengrin* was restored, in an English version, and was followed by *Die Walkure* (1921). After that, these and other works were sung again in the original German. During 1918–22 the regular season included a four weeks' visit to New York. The year 1922 is memorable for a transcontinental tour (January–April), which was as brilliant artistically as it proved disastrous financially. Three operas by foreign composers had their world première in Chicago: Lazzari's *Le Sauteriot* (1918), Février's *Gismonda* (1919), and Prokofiev's *Love for Three Oranges* (1921). Native composers were encouraged by the production of Buchhalter's *A Lover's Knot* (1916), Hadley's *Azora* (1917), Nevin's *The Daughter of the Forest* (1918), De Koven's *Rip Van Winkle* (1920), and Stearns's *The Snow Bird* (1923). Two ballets by American composers were given in 1919, Borowski's *Boudour* and Carpenter's *The Birthday of the Infanta*. The following foreign works were given for the first time in the United States: Gnecchi's *Cassandra* (1914); Saint-Saëns's *Déjanire* (1915); Massenet's *Cléopâtre* (1916); Gunsbourg's *Le Vieil Aigle* (1917); Catalini's *Lorelcy* and Montemezzi's *La Nave* (1919); Ravel's *l'Heure Espagnole*, Messager's *Madame Chrysanthème*, Erlanger's *Aphrodite*, Marinuzzi's *Jacquerie* and Leoncavallo's *Edipo Rè* (1920)

Metropolitan Opera House (New York). The decade at the Metropolitan Opera House, under Giulio Gatti-Casazza as general manager, was a period of unexampled prosperity. There was no annual deficit to be met. Year by year the number of subscribers increased. No promises were made that were not strictly fulfilled. During the period of the War the works of Wagner and Strauss were temporarily withdrawn, but, beginning in 1920, they were restored, one after the other, to the repertoire. The policy of producing every season a work by an American composer, inaugurated in 1910, was maintained until 1920, except for the years 1915 and 1916. Thus the following operas were brought out: De Koven, *The Canterbury Pilgrims* (1917); Cadman, *Shanewis* (1918); Breil, *The Legend*, and Hugo, *The Temple Dancer* (1919); Hadley, *Cleopatra's Night* (1920). A ballet by an American, Gilbert's *The Dance in Place Congo*, was performed in 1918. Four world premières of works by foreign composers are to be recorded: Giordano, *Madame Sans Gêne* (1915); Granados, *Goyescas* (1916); Puccini, *Il Tabarro, Suor Angelica*, and *Gianni Schicchi* (1918); Wolff, *l'Oiseau Bleu* (1919). Following are the foreign operas given their American premières: Montemezzi's *L'Amore dei tre Rè*, Charpentier's *Julien*, and Wolf-Ferrari's *L'Amore Medico* (1914); Leoni's *L'Oracolo* and Borodin's *Prince Igor* (1915); Bizet's *Les Pêcheurs des Perles*, Gluck's *Iphigenie auf Tauris*, and Zandonai's *Francesca da Rimini* (1916); Rabaud's *Marouf* (1917); Liszt's *The Legend of St Elizabeth* and Mascagni's *Lodoletta* (1918); Leroux's *La Reine Fiammette* (1919); Leoncavallo's *Zaza* and Tchaikovsky's *Eugen Oniegin* (1920); Weiss's *The Polish Jew* and Korngold's *Die tote Stadt* (1921); Mozart's *Così Fan Tutte* (1922); Vittadini's *Anima Allegra* and Schillings's *Mona Lisa* (1923); Riccitelli's *Compagnacci* (1924). The following operas, produced by other organizations than the Chicago and Metropolitan companies, complete the list of American premières during the decade: 1914, Mozart's *Bastien et Bastienne* (New York); 1915, Parker's *Fairyland* (Los Angeles); 1916, Moniuszko's *Verbum Nobile* (Philadelphia) and Mozart's *The Impresario* (New York); 1917, Donizetti's *Campanella di Notte*, Pergolesi's *La Serva Padrona*, Gounod's *Le Médecin malgré Lui* (all in New

York); 1918, Hadley's *Bianca* (New York); 1919, Vives's *Maruxa* and *Los Bohemios* and Messager's *Monsieur Beaucaire* (both in New York); 1922, Dargomyzhsky's *Russalka* and Rimsky-Korsakov's *Tsarskaya Neviesta* (San Francisco); 1923, Moniuszko's *Halka*, d'Albert's *Die Toten Augen*, and Kienzl's *Der Evangelimann* (all in Chicago).

Oratorio. The steady decline of public interest in oratoria, which began long before the close of the last century, went on unchecked after 1914, with the result that the few works written in this form were produced by serious musicians mostly little known to the public Even the masterpieces of Händel, Haydn, and Mendelssohn were heard less and less frequently.

Orchestras. While in the United States the opera formerly engaged the principal interest of the general public, the decade 1914–24 wrought a change in favor of orchestral music. All the older organizations vastly increased the number of their concerts, so that the orchestral season extended from October to May. In 1914 the Boston Symphony Orchestra had no rival in this country. Even then it was no secret that the perfection of its ensemble was due to daily rehearsing. Unfortunately no other orchestra at that time had a patron like Colonel Higginson who would bear the enormous expense involved The longer musical season provided the natural solution of the problem, so that in 1924 we could boast not one but several premier orchestras unsurpassed anywhere in the world. Daily rehearsals had produced the identical result in all cases Visits of orchestras to other cities and exchange of conductors had engendered a spirit of rivalry which makes for supreme efficiency The soloist, formerly an indispensable attraction at every symphony concert, had come to occupy a secondary position. In 1912 the Boston Symphony Orchestra, under Dr. Muck, made the first successful experiment in giving concerts without the aid of soloists. From that time the practice became so common, that in 1924 soloists were engaged for perhaps not more than half the season's concerts. This widespread and intelligent interest in the music itself, rather than in the executant, had created a new, collective method of subventioning orchestras. The cost of maintaining a first-class organization is so heavy that the income from admissions is in every case insufficient to meet expenses. The burden of the inevitable annual deficit, formerly borne by some wealthy patron especially interested (e.g., Higginson, Carnegie, Flagler), was being assumed by several guarantors, each contributing a relatively small amount In the latter years more than one of our premier orchestras was threatened with dissolution because of inability to meet the high cost of maintenance. In every case a sufficient number of public spirited citizens came forward to avert a serious loss to the community And when one considers that from the conclusion of the War every year new symphony orchestras were established throughout the country, he cannot but be impressed with the development of public taste during the decade

Boston Symphony Orchestra. The refusal of Dr Muck, in the fall of 1917, to play the national anthem before the concert, was the beginning of a period of storm and stress. He resigned at the end of the season. At the same time Colonel Higginson severed his relations with the orchestra, delegating his powers and responsibilities to a board of nine directors. More than 20 German players, who had failed to take out naturalization papers, were dismissed. In 1918–19 Henri Rabaud was the conductor; under him the orchestra rapidly deteriorated. When Pierre Monteux, in the fall of 1919, assumed control, he found a demoralized body of men, many of whom rebelled and deserted before the end of the season, so that out of a total of 100 performers only 67 remained for the final concerts. In addition, a deficit of $131,000 brought the organization to the verge of dissolution (April, 1920). An appeal by the directors secured not only this amount but also a guarantee fund, pledged by 200 contributors, for five years. With a thoroughly reorganized and practically new orchestra Monteux began the difficult task of regaining the lost prestige When Sergei Kussevitsky became conductor, in 1924, he found that his predecessor's efforts had been crowned with success

Chicago Symphony Orchestra. In 1914 a pension fund was established through the gift of $100,000 by Mrs. E. S. Coolidge, who donated the same amount also the next year. In 1923 Clyde M. Carr bequeathed to the organization $1,000,000 to be used at the discretion of the trustees. In the spring of 1923 a number of music lovers saved the orchestra from disbanding by assuming responsibility for a considerable increase in the salary of the men demanded by the musical union

Cincinnati Symphony Orchestra. After the internment of the conductor, Dr. Kunwald (January, 1918), the remaining concerts of the season were given under guest conductors In 1918–22 Eugène Ysaye was conductor. His successor was Fritz Reiner

Minneapolis Symphony Orchestra. In 1922 Max Oberhoffer resigned and was succeeded by Henri Verbrugghen. At the same time the orchestra widened its field of activity by adding a series of 16 concerts in St. Paul, a series of 25 popular Sunday concerts and 5 educational concerts for young people

National Symphony Orchestra. This organization was founded in New York in 1919 as the New Symphony Orchestra, under Edgar Varèse, for the exclusive production of futuristic works. The complete failure of the first concert (April 11) so alarmed the guarantors that they dismissed Varèse and engaged Bodanzky, who played only standard works at the remaining concerts. His success led to the incorporation of the orchestra as the National Symphony Orchestra, beginning its career in October, 1919 In the summer of 1920 it was engaged for the series of open-air concerts at the Stadium of the College of the City of New York, under Walter Rothwell as guest conductor. As Bodanzky's duties at the Metropolitan Opera House did not allow him sufficient time, the directors engaged Mengelberg for the second half of the season (January–March, 1921) He made a sensational success and remained with the organization after its amalgamation with the Philharmonic Society.

New York Philharmonic Society. The amalgamation of the society with the National Symphony Orchestra in 1921 led to a complete reorganization Many of the older men were retired on pension, the personnel was increased to 125 performers, and a new schedule for in-

tensive rehearsals was adopted. Mengelberg was engaged as coördinate conductor with Stransky, the former directing the last half of the season, the latter the first half. In 1923 Stransky resigned and was succeeded by Willem Van Hoogstraten. From 1916–20 William Humiston was associate conductor; after those years the position was filled by Henry Hadley. During the summer of 1922 the entire orchestra was engaged for the open-air concerts at the Stadium; the first half of the series was led by Hadley; the second, by Van Hoogstraten In 1923 Van Hoogstraten was conductor of the entire series. With the proceeds of two festival concerts celebrating the eightieth anniversary of the foundation of the Society (April, 1922) a benefit fund was established for the members.

New York Symphony Orchestra. Under its regular conductor, Walter Damrosch, the orchestra made a most successful tour of France, Italy, Belgium, and England in May and June, 1920 In 1921 and 1922 Albert Coates directed several concerts as guest conductor. Bruno Walter appeared in the same capacity in 1923–24, and Vladimir Golschmann in 1924.

Philadelphia Symphony Orchestra. In 1916 Edward Bok donated to the orchestra $250,000 and pledged himself to pay any deficit for the next five years. In 1918 a regular series of five concerts in New York was established, the number of which was increased to 10 in 1921. During the absence of Leopold Stokowski as guest conductor in Paris, in 1923, his place was taken by Georges Enesco.

St. Louis Symphony Orchestra. After the death of Max Zach, in 1921, the remaining concerts of the season were led by guest conductors. From the fall of 1921 Rudolf Ganz was regular conductor

Following is a list of the more important new symphony orchestras established during the decade. 1914: Detroit S. O., Weston Gales 1914–18, then Ossip Gabrilówitsch; 1916: Baltimore S. O, Gustav Strube; 1918: Cleveland S. O., Nikolai Sokolov; 1919· Los Angeles Philh. O., Walter Rothwell; 1920: Nashville S. O., F. A. Henkel; Toledo S. O., Lewis Clement; 1921: Erie S. O., Henry Vincent, Buffalo S. O, Arnold Cornelissen; 1922· Syracuse S. O., William Berwald; Watertown S. O, Patrick Conway, Salt Lake City Philh. O., Charles Shepard; Wichita S. O, P H. Flath, 1923: State S O. (New York), Josef Stransky; Rochester Philh. O., Eugene Goossens and Albert Coates as guest conductors; Civic S. O. of Philadelphia, Vassili Leps; Atlantic City Philh. Soc., Louis Colmans; American National O. (New York), Howard Barlow.

MUSSOLINI, BENITO (1884–). An Italian statesman, founder of the Fascisti. He was born at Predappio-Forli and educated at the Salesian College in Faenza and the University of Lausanne (Switzerland). When he began his career he was a Marxian socialist and was expelled from Switzerland and also from Austria on account of his views. He returned to his birthplace and there started *Lotta di Classe* and later became the editor of the *Avanti.* He was also a director of the Italian Communist party. At the outbreak of the War in 1914, he took the side of the Allies and urged that Italy enter the conflict against Germany. He was expelled from the Socialist party and at once started a new paper, the famous *Popolo d'Italia.* Fighting in the War as a corporal in the infantry, he was wounded, decorated, and discharged. Later he returned to his editorial desk. In 1919, when the wave of communism swept over Italy and the government at Rome seemed unable to combat the disorder prevalent in the country, Mussolini raged against the traitors who were ruining Italy; on Mar 23, 1919, he founded the first "Fascio di Combattimento," which was later to be known collectively as the Fascisti, from the Roman *fasces.* Officers and soldiers rallied to his support, and by 1922 there were about 4,000,000 Fascisti in Italy. Civil war raged during 1922 between the Fascisti and the Communists. Mussolini's legions reopened factories, stopped strikes, and broke up trade unions. By August the power of communism was broken In October, 1922, Mussolini declared he would take the government by force if it were not given to him willingly. On Oct 30, 1922, the King made him prime minister. He made drastic reforms during 1923, and in the April elections of 1924 the Fascisti received 65 per cent of the votes cast. See FASCISM and ITALY.

MUTATION THEORY. See ZOÖLOGY.

MUZZEY, DAVID SAVILLE (1870–). An American historian and author, born at Lexington, Mass., and educated at Harvard University, Union Theological Seminary, New York and Columbia Universities, and in Berlin and Paris. After serving as tutor in mathematics at Robert College in Constantinople for one year, he became a teacher of Latin and Greek in the Ethical Culture School of New York. In 1905 he was appointed head of the department of history at Barnard College and was successively associate, associate professor, and professor; the last office he assumed in 1920. He was a member of several learned societies and wrote *Rise of the New Testament* (1900); *Spiritual Heroes* (1902); *Beginners' Latin Book* (1907); *American History* (1911); *State, Church, and School in France* (1911); *Life of Thomas Jefferson* (1918); and *The United States of America* (1922).

N

NANSEN, FRIDTJOF (1861–). A Norwegian Arctic explorer (see VOL. XVI). He was active during the War and was chairman of the Norwegian Association for the Nations in 1918. In the following year he proposed to the Allies the formation of a central commission for the supply of food to Russia. This was rejected by the Bolshevist government, which would not agree to the Allies' conditions that hostilities should first cease. He was asked by the Council of the League of Nations in 1920 to investigate problems in connection with the repatriation of prisoners of war; on this subject he prepared an exhaustive report. From 1920 to 1923 he had general charge of the direction of relief for Russian refugees. He published *Through Siberia* in 1914.

NAPHTHA. See PETROLEUM.

NASHVILLE. The capital of Tennessee. The population rose from 110,364 in 1910 to 118,342 in 1920, and to 121,128, by estimate of the Bureau of the Census for 1923. The city changed its form of government to the commission-manager plan in 1918. A nine-hole municipal golf course was constructed in 1923. In 1924 the city, in coöperation with Davidson County and the State of Tennessee, was engaged in building, at a cost of $2,225,000, a memorial to the soldiers in the late War, which occupied two blocks in the centre of the city and was to contain an auditorium seating 2500 persons. A temporary replica of the Parthenon which had been built some years previously, was reconstructed in more permanent form during the decade.

NATHAN, GEORGE JEAN (1882–). An American author and dramatic critic, born in Fort Wayne, Ind., and educated at Cornell University and the University of Bologna, Italy. From 1905 he has been connected with various newspapers He was dramatic critic, with Huneker, of *Puck* (1915–16), and of the *Smart Set Magazine* (1908–23). During 1914–23 he was editor of *Smart Set* with H. L. Mencken, and in 1924 he started with Mencken a new magazine, *The American Mercury*. His knowledge of the French, German, and English stage, and his keen observation, perspicacity, and discriminating sense of humor, have made him one of the leaders in criticism in the United States Some of his books are *The Eternal Mystery* (1913); *Another Book on the Theatre* (1916); *Bottoms Up* (1917); *Mr. George Jean Nathan Presents* (1917); *A Book Without a Title* (1918); *The Popular Theatre* (1918); *Comedians All* (1919); *Heliogabolus*, with H. L. Mencken (1920); *The American Credo*, with H. L. Mencken (1920); *The Theatre, the Drama, the Girls* (1921); *The Critic and the Drama* (1922).

NATHAN, ROBERT (1894–). An American author, born in New York City. He was educated in private schools in the United States and Switzerland and took graduate courses at Harvard. His published writings include *Peter Kindred* (1919); *Autumn* (1920); *Youth Grows Old* (1922); and *The Puppet Master* (1923) He also composed songs and a sonata for the violin.

NATIONAL SAFETY COUNCIL. A cooperative, noncommercial organization established in 1913 as an outgrowth of the safety congress held under the auspices of the Association of Iron and Steel Engineers in Milwaukee. The council consists of an association of companies and individuals active in promoting safety in industrial establishments, on the streets, and in the homes. Annual meetings are held in which matters relating to this object are discussed. The meeting of 1915 was held in Philadelphia. There were present representatives from the mines, railroads, public utilities, and industrial establishments. Each of these groups held sectional meetings to discuss their technical problems. The Eighth Annual Safety Congress was held in Cleveland in October, 1919. There were meetings of the 19 sections of the Council representing the various industries of the United States. The programme for 1919 included the extension of the work into many new fields. In 1920 the *National Safety News*, organ of the Council, was enlarged from a one-

sheet bulletin to a 12-page magazine and began an active campaign for spreading safety propaganda throughout the country. The annual meeting of 1920 was held in Milwaukee. In 1920 the council continued active in safety propaganda, with great success. Extensive research was continued into the particular hazards and safety practices in the construction and management of particular equipment. The congress of the Council in 1922 was held in Detroit, Mich. Over 2000 members met to discuss their problems and to hear speakers of national reputation. Work with schools was vigorously carried on. Through a publication entitled *Education in Accident Prevention: Methods and Results*, the city superintendents in all cities of 20,000 or more population were reached, and in many cases a definite safety plan was incorporated in the curriculum Gratifying progress was reported in the activities of the organization in 1923. Two million copies of workmen's bulletins were distributed during the year, at the rate of 36 new and different ones per month. The magazine grew to 64 pages. The 12th annual congress was held in Buffalo in October. Over 3500 delegates were in attendance, representing every State in the Union and every major industry in North America. The Council in this year had 23 specialized sections relating to all phases of industry. Its membership was about 4000, operating 8000 industrial plants, and employing more than 7,000,000 men Community safety councils had by this time been organized in 60 cities to carry on public and industrial safety work in each community. Combined population of these cities where organized safety programmes are under way totaled 25,000,000 in July, 1924. L. A. DeBlois was elected president in 1923, and C. B. Auel was chosen vice president in charge of general activities. The managing director and secretary was W. H. Cameron.

NATURAL GAS. Although fears were expressed as to the ultimate exhaustion of natural gas in the years 1914–24, consumption increased, and systems of pipe lines were developed from the leading production centres, of which West Virginia, Oklahoma, Pennsylvania, Ohio, and California were perhaps the most important. In 1913 the consumption of natural gas in the United States was 581,898,239,000 cubic feet, 38 per cent of which was consumed by domestic consumers and 62 per cent by industrial consumers. The average price per 1000 cubic feet received by distributors at this time was $.051. In 1914 the natural gas consumed was 591,867,000,000 cubic feet, and from this time it steadily increased until in 1920 the maximum consumption of 798,210,000,000 cubic feet was scored. In the following year, 1921, there was a decline in the consumption, which then amounted to 662,052,000,000 cubic feet, and the market value of the gas used was about $175,000,000, a decrease about $25,000,000 in the value from 1920.

At this time there were more than 2,500,000 domestic consumers of natural gas and about 21,000 industrial concerns using it as fuel. In the following year, 1922, 762,546,000,000 cubic feet were consumed in the United States, at an estimated value of $84,873,000 at the wells and of $221,535,000 at the points of consumption. By 1919 the cost at the point of distribution had increased to $.216 per 1000 cubic feet, and in 1922 it was $.291 per 1000 cubic feet. In 1922 the average charge for domestic consumption was $.499, an increase of more than $.15 in the previous four years. The 1922 consumption was some 15 per cent more than that of 1921 but 4 per cent less than the amount consumed in the record year of 1920. The five leading States in production were West Virginia, Oklahoma, Pennsylvania, Louisiana, and California. The amount of production did not measure the relative consumption of the various States, as Pennsylvania in 1922 led as a consumer, followed by Ohio, Oklahoma, California, and West Virginia. There was also an increased interstate movement of natural gas, which, by 1922, had amounted to 179,000,000,000 cubic feet. West Virginia, which contributed 25 per cent of the total production and consumed only 10 per cent, contributed 66 per cent of the gas transported to other States, where the average price per 1000 cubic feet in 1913 was $.051 at the point of distribution.

In 1924 the industry had developed to a stage where the production and transportation of natural gas was no longer characterized by wastefulness and inefficiency. Various methods were adopted to conserve this fuel, as it was realized that while it was fast disappearing it was a commercially valuable natural resource.

In addition to domestic and industrial uses as fuel, an important branch of the industry was the manufacture of gasoline from natural gas. In 1911, when the United States Geological Survey collected its statistics for gasoline from natural gas for the first time, it was reported that the year's production of gasoline thus obtained amounted to 7,425,839 gallons valued at $531,704, or $.0716 per gallon. This gasoline represented the output of 176 plants conducted by 132 operators, with a total daily capacity of 37,100 gallons, and employing an estimated volume of natural gas of 2,475,697,000 cubic feet, which was valued at $176,961. The average yield of gasoline per 1000 cubic feet was 3 gallons. This industry steadily increased, so that in 1914 the amount of gasoline produced was 42,652,632 gallons valued at $3,105,909. By 1922 the production of natural gas and gasoline amounted to 505,832,000 gallons, valued at the plants at $72,711,063, or an average of $.144 per gallon. To produce this gasoline, 545,000,000,000 cubic feet of natural gas were treated, or approximately 71 per cent of the total quantity consumed for the year. Gasoline from natural gas was produced by what is known as the compression process, which in 1922 accounted for 285,670,163 gallons; by the absorption process, by which were manufactured 182,209,056 gallons; by a combination process, which produced 36,035,999 gallons; and by a drip process, which produced 1,916,782 gallons. See CHEMISTRY, ORGANIC.

Bibliography. Besides the publications of the United States Geological Survey and the United States Bureau of Mines, which are generally available, reference may be made to L. C. Lichty, *Measurement Compression and Transmission of Natural Gas* (New York, 1924), and the chapters on natural gas in *The Handbook of the Petroleum Industry*, 2 vols., edited by D. T. Day (New York, 1922). This volume discusses the manufacture of gasoline from natural gas.

NAVAL VESSEL. See VESSEL, NAVAL.

NAVIES OF THE WORLD. The approval in 1923 of the Five Power Naval Pact for the limitation of armaments by the Governments of France and Italy put that treaty in force, as the Governments of the United States, Great Britain, and Japan had given their assent soon after the conclusion of the Conference. While its terms only then became binding on the signatories, no one of the five powers had in any way contravened any of them since the Pact was originally signed by the diplomats at the Disarmament Conference. Not only did new work cease, but scrapping of the older vessels designated for such a fate by the Pact had to a considerable extent been carried out. Scrapping of the new vessels was proceeding at a rapid rate in 1924. The general condition of the more important navies of the world on July 1, 1924, was briefly as follows.

Argentina. The navy consists of 2 dreadnaught battleships of 27,600 tons (12 12-inch guns) completed in 1914; four armored cruisers of 6800 to 7100 tons, completed 1895–97; three old protected cruisers of 2750 to 4800 tons, completed 1892–97; two old monitors of 2336 tons, completed 1892–93; 8 destroyers of 1100 to 1200 tons, completed 1911; several large gunboats, river gunboats, transports, old torpedo boats, etc. It was proposed to refit the battleships in the United States and to order about 12 large destroyers.

Austria possessed neither navy nor seacoast but had four armed patrol vessels on the Danube.

Australia. Since the close of the War, the Australian navy was steadily reduced. Late plans called for the sale of 24 out of the 34 vessels on the navy list. Those to be retained were four light cruisers of about 5500 tons, completed 1912–20; one flotilla leader of 1660 tons, completed 1917; and five destroyers of 1250 tons, 36 knots, completed 1919. At last accounts in 1924 there still remained on the list six submarines of 1820 tons, completed 1917–19; several destroyers of 700 tons, and 3 1250-ton sloops, completed 1915. These were all effective vessels and in good condition. The battle cruiser *Australia* was scrapped in accordance with the terms of the Five Power Naval Pact. From statements which appeared in the British and Australian press it appeared that Australia desired to depend for defense chiefly on the British fleet but would pay her share of the cost of defense by the Royal Navy.

Brazil. The Brazilian Congress authorized the construction of a training-ship, a mine transport, and a surveying ship. The Minister of Marine proposed the construction of a battleship of 35,000 tons, a cruiser of 10,000 tons, 5 destroyers, 5 submarines, an aircraft service, and some mine-layers and sweepers. The navy in 1924 consisted of 2 battleships of 19,281 tons (12 12-inch guns), completed in 1910; 2 armored coast defense vessels, 1900–01; 2 light cruisers of 3100 tons and 27 knots, 1910; 2 old cruisers; 4 river gunboats; 1 mine-layer; 2 river monitors; 10 destroyers of 550 tons, completed in 1908–10; 1 destroyer of 950 tons, 1913; 1 torpedo boat, 1907; and 3 submarines, 1914.

Canada. Having from motives of economy reduced her naval, military, and air establishments to almost nothing, Canada consolidated them under the new Ministry of Defense. The naval force in 1924 consisted of 2 destroyers and 4 mine-sweepers, half based at Halifax and half at Equimault, where they were used to train the Canadian naval reserve which was to act as a nucleus in case future naval expansion should be found necessary.

Chile. The navy consists of one modern battleship of 28,000 tons, 10 14-inch guns, 23 knots speed, completed in 1915; 1 old battleship of 6000 tons; 2 old armored cruisers of 7000 and 8500 tons; 5 old protected cruisers of 2000 to 4500 tons; 4 flotilla leaders of 1700 to 1850 tons, completed in 1912–14; 7 small destroyers, 3 torpedo boats; 2 submarines, 1913. It was said in 1924 that notwithstanding their age, the vessels of the Chilean navy were in serviceable condition and that the efficiency of the personnel was excellent.

China. The Chinese navy as a unified force no longer existed. There were many small cruisers, gunboats, destroyers, torpedo boats, etc. Some vessels were controlled by the Canton government; some by the government at Peking; others were a law unto themselves or had unknown affiliations. The natural result was a breakdown of morale and discipline as well as a deterioration of the vessels from lack of care and of means for effecting repairs and preservation.

Denmark. In the naval budget for 1923–24, 10,342,000 crowns were allotted for new construction, including aircraft and aviation supplies. The new construction comprised 2 submarines and 1 lighthouse tender and ice breaker. The Danish navy consisted of 5 armored coast defense vessels of 2200 to 4100 tons; 4 small cruisers of 1300 to 3000 tons; about 15 mine-layers and sweepers; and various auxiliary vessels. The personnel had a high reputation for efficiency.

France. After a long delay, the French government signed the Five Power Naval Pact for the limitation of naval armaments. As France and Italy were the real gainers by the carrying out of the Pact, their attitudes toward it were rather remarkable. Were it not for the Pact, the United States, Great Britain, and Japan would soon have possessed navies of such strength that those of France and Italy would have descended to relative impotence. The United States alone scrapped tonnage of six times the fighting value of existing French dreadnaughts. Instead of possessing a navy in 1925 of 10 times the power of France, the United States restricts itself to 3 times. Great Britain

and Japan made great if considerably less reductions.

The building programme under construction in France in 1924 consisted of 3 light cruisers of 8000 tons, 6 flotilla leaders of 2400 tons, 12 torpedo boats of 1450 tons, 6 submarines of 1100 tons and 6 of 680 tons; the battleship *Bearn*, only partly built, was to be transformed into an airplane carrier of about 23,000 tons. These vessels were to be completed in 1925. The second part of the naval programme, which up to the summer of 1924 had not been wholly authorized by the French Parliament, was designed to be laid down during the years 1925–28 and completed in 1930. It consisted of 6 light cruisers of 10,000 tons, 15 flotilla leaders of 2400 tons, 24 destroyers of 1450 tons, 4 submarine cruisers of 3000 tons, 30 first-class submarines of 1300 tons. The cruisers of 8000 tons were to have a speed of 34 knots and to carry 8 6.1-inch guns in 4 turrets, 4 2.95-inch anti-aircraft guns, and 4 21.7-inch torpedo tubes. Two 10,000-ton cruisers were to be laid down in 1925. The reported details were: speed, about 35 knots; battery, 8 8-inch guns and 20 anti-aircraft guns. As the weight necessary to armor the upper deck as a defense against air-bombs would reduce the possible speed, numerous anti-aircraft guns were substituted. It is expected that they will enable the ship to meet attacking airplanes with a hail of chemical projectiles. The 8-inch guns were to be mounted in gas-tight turrets to obviate danger from gas bombs and gas shells The flotilla leaders were to be of about 2400 tons. The principal details were: length, 380.6 feet; beam, 36 3 feet; mean draft at a displacement of 2400 tons, 14 8 feet; speed, 35.5 knots; armament, 6 5.1-inch guns, 2 2.9-inch anti-aircraft guns, and 2 triple torpedo tubes for 21.7-inch torpedoes. The destroyers were to be of 1400 tons; speed, 33 knots; armament, 4 5.1-inch guns.

The French navy in 1924 consisted of 6 dreadnaught battleships of 23,100 tons, 2 carrying 10 13 4-inch guns and 4 carrying 12 12-inch guns; 3 old battleships of 18,890 tons carrying 4 12-inch and 12 9 4-inch guns; 10 old armored cruisers of 9400 to 14,100 tons but of little fighting value; 5 (ex-German) light cruisers (26 to 28 5 knots); 19 destroyers of 800 to 950 tons, 27 destroyers of 350 to 685 tons; and about 60 submarines.

Germany. The Allied Supreme Council increased the number of battleships and of cruisers which Germany was permitted to retain from 6 to 8, the additional 2 to be always in reserve without ammunition or supplies The battleships might be replaced by new ones of not more than 10,000 tons and the cruisers by new ones of not more than 6000 tons, after 20 years from the date of completion. All will have reached that age before new ones can be built. The only vessel under construction in 1924 was a light cruiser of 5600 tons. The 8 battleships were of 13,000 tons and were to carry 4 11-inch and 14 6.7-inch or 5.9-inch guns. The 8 cruisers were small and all but 2 were over 20 years old. There were 16 destroyers and 16 torpedo boats.

Great Britain. The Naval Estimates for 1924–25 called for an expenditure of £55,800,000. The personnel of the navy, coast guard, aviation service, and marine police was fixed at 100,500, an increase of 1000 over the figures for the previous year. The vessels under construction or to be laid down in 1924 were the battleships *Nelson* and *Rodney*, commenced early in 1923, 2 or 3 submarines, 7 to 9 light cruisers of about 10,000 tons, and the mine-layer *Adventure* of 7000 tons. The aircraft carriers *Eagle* (22,700 tons) and *Hermes* (10,400) had been under construction for many years but were not reported as completed by the middle of 1924.

The battleships *Nelson* and *Rodney* were the only vessels of their class under construction in any country in 1924. Their displacement was the maximum allowed by the Five Power Naval Pact, 35,000 standard tons. This was computed on a slightly different basis from that of existing capital ships, but they would probably be 3000 tons larger than any existing battleships except the British *Hood* and 6000 to 10,000 less than most of the capital ships scrapped under the terms of the Pact. As their design was an attempt to solve problems of naval construction which appeared to demand much greater size, it was being studied with interest by all naval authorities. The principal details available, July 1, 1924, were: length, 660 feet; beam, extreme, 106 feet; mean draft, 30 feet; speed, 23 knots; boilers, oilburning; engines, geared turbines; 3 turrets, each mounting 3 16-inch guns; all turrets on the central line, 2 on the forecastle, the after one firing over the other, the third just forward of the smokepipe; no stern fire from 16-inch guns, but the after turret could fire nearly astern with the outboard guns; 12 6-inch guns in 6 turrets, 3 on each beam; 12 4-inch anti-aircraft guns with vertical or nearly vertical fire; above-water triple torpedo tubes for 21-inch torpedoes; quarter-deck clear of all structures in order to permit the landing and despatch of airplanes; armor belt, 13 inches thick; 3 armor decks, upper deck, deck at top of belt, and curved deck extending to lower edge of belt; side heavily bulged and compartmented for antitorpedo protection; hydraulic steering and turret machinery.

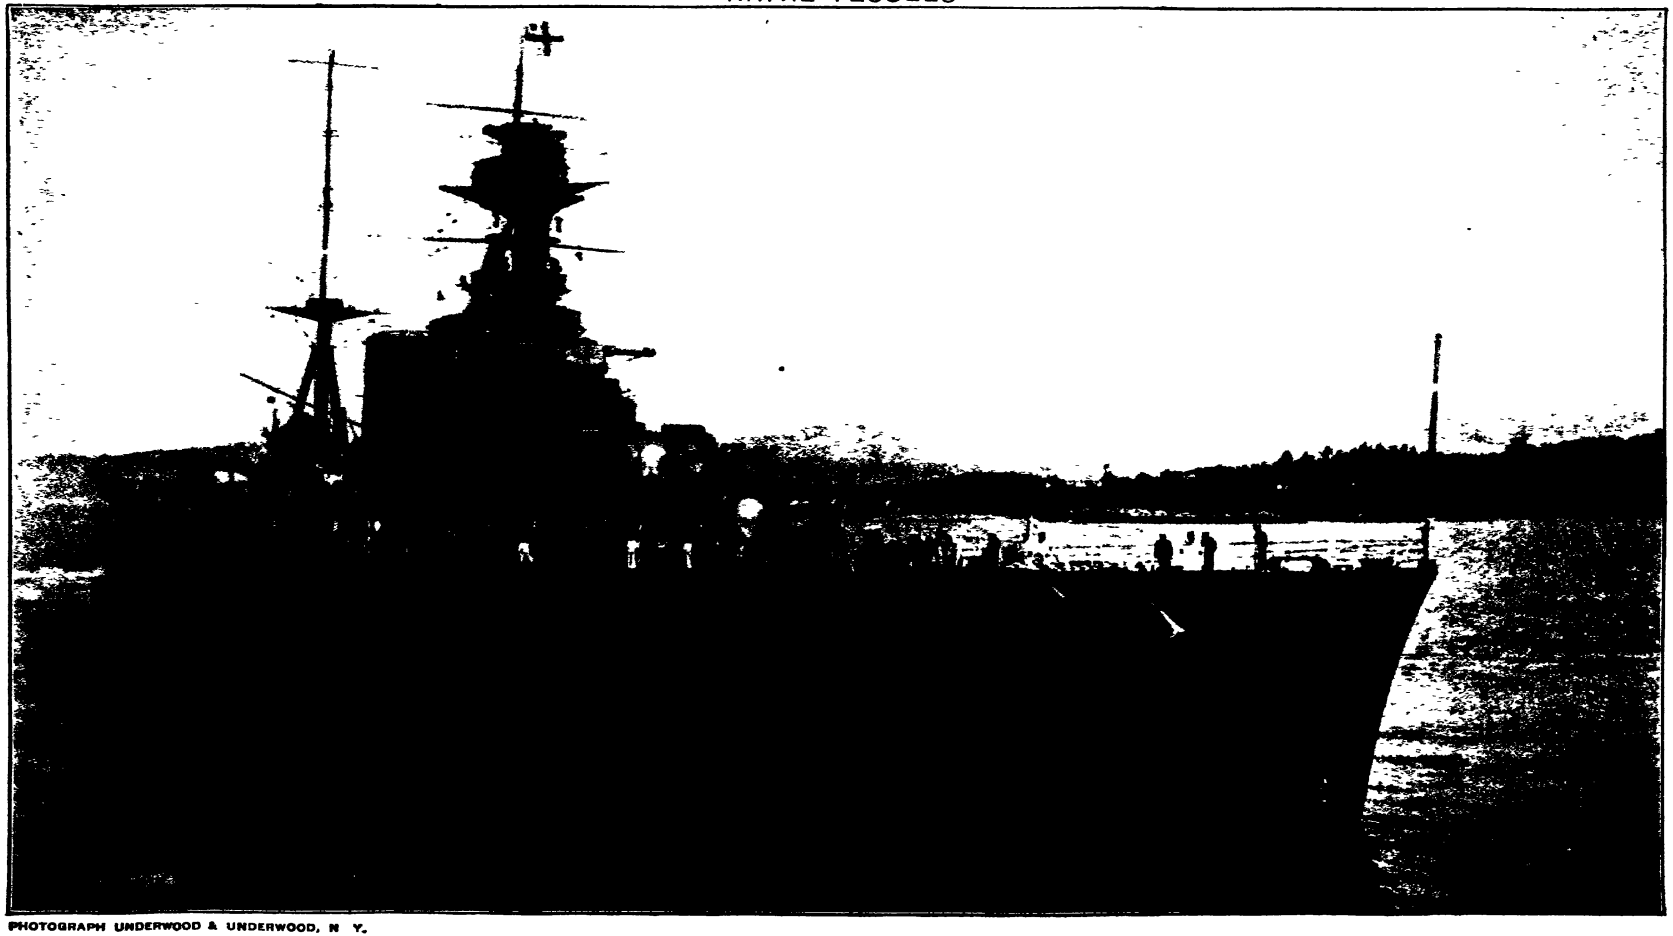
The new submarine *X1*, completed in 1923, had finished her trials in 1924 and was said to have failed to realize the hopes of her designers. She was much the largest submarine ever built, having a submerged displacement of 3500 tons and a surface displacement of 2750 tons with corresponding speeds of 18 and 33 knots. The Admiralty and seagoing officers of all ranks in 1924 were fighting hard to obtain entire control of the naval aviation service. To have the most suitable designs for naval aircraft, which differ widely from those in land service, to have naval aviators who possess intimate knowledge of the details of naval affairs, and to have a continuous naval organization and control of the air forces of each fleet or other naval unit are so vital to efficiency that the slight financial gain in a consolidated air service should not be considered.

The vessels of the British navy in 1924 were: 5 battleships of 25,750 tons (8 15-inch guns, 23 knots), 5 battleships of 27,500 tons (8 15-inch guns, 25 knots), 4 battleships of 25,000 tons (10 13.5-inch guns, 21 knots), 4 battleships of 23,000 tons (10 13.5-inch guns, 22 knots), 1 battleship of 41,200 tons (8 15-inch guns, 31 knots); 1 battle cruiser of 28,500 tons (8 13.5-inch guns, 30 knots), 2 battle cruisers of 26,500 tons (6 15-inch guns, 32 knots); 35 light cruisers with a speed of 29 knots (14 of 3750 tons,

3 of 4120 tons, 10 of 4190 tons, 8 of 4750 tons), 6 light cruisers of 25.5 knots (3 of 5250 tons, 3 of 5400 tons), 3 light cruisers of 9750 tons and 30 knots, and 3 of 7550 tons and 32 knots; 17 flotilla leaders of 1610 to 1800 tons; 170 destroyers of 1040 to 1350 tons and 34 to 36 knots; 27 steam sloops of 1250 tons and 17 knots; 56 twin-screw mine-sweepers of 800 tons and 16 knots; 16 patrol boats of 573 tons and 22 knots; and 92 submarines of 500 to 3500 tons (submerged), most of them of 800 to 1100 tons.

Greece. The defeat of Greece by the Turks and the various political upheavals and financial disturbances interfered with the development of the navy. The fleet in 1924 consisted of 2 pre-dreadnaught battleships (formerly the *Mississippi* and the *Idaho*) of 13,000 tons, 1 armored cruiser of 9956 tons and 24 knots; 1 light cruiser of 2600 tons and 23 knots; 11 destroyers of 350 to 980 tons; and 2 submarines of 460 tons. The dreadnaught battleship *Kalamis* was ordered in Germany in 1913. At the close of the War she was still far from finished but probably would be completed in a French shipyard. As designed, the displacement was 19,500 tons; length, 570 feet; beam, 82 feet; draft, 26 feet; speed, 25 knots; battery, 8 14-inch guns, 12 6-inch guns, and some of 3-inch calibre. In addition to completing the *Kalamis*, Greece ordered 4 large destroyers in England.

Italy. The naval budget for 1923–24 was 770,465,015 lire (1 lira = about $.043). No new construction of any importance was in hand. A building programme was announced in 1923, the work to begin as follows: 1924–25: 2 light cruisers, 4 destroyers, 4 submarines; 1925–26: 4 destroyers, 4 submarines; 1926–27: 4 destroyers, 4 submarines; 1927–28: 1 light cruiser, 4 destroyers, 4 submarines. The Italian navy in 1924 consisted of 5 battleships of about 22,500 tons (13 12-inch guns, 23 knots), 1 battleship of 19,500 tons (12 12-inch guns, 24 knots), 4 predreadnaught battleships of 12,600 tons; 3 armored cruisers of 9956 tons and 22.5 knots; 8 light cruisers of 3200 to 4800 tons and 27 to 28 knots, 1 light cruiser of 3700 tons and 22 knots; 8 flotilla leaders or scouts of about 35 knots speed, 2 of them of 1500 tons, 2 of 1800 tons, 3 of 2158 tons, and 1 of 2500 tons; 14 destroyers of 320 to 380 tons, 42 destroyers of 650 to 850 tons, 12 destroyers of 922 to 1012 tons, 1 destroyer of 1354 tons; about 90 torpedo boats of 110 to 210 tons; 33 submarines of 300 to 460 tons, and 10 of 920 to 1000 tons. One of the battleships of 22,500 tons, the *Leonardo da Vinci*, was blown up and sunk during the War; it was later raised, but whether it would be repaired or not was uncertain.

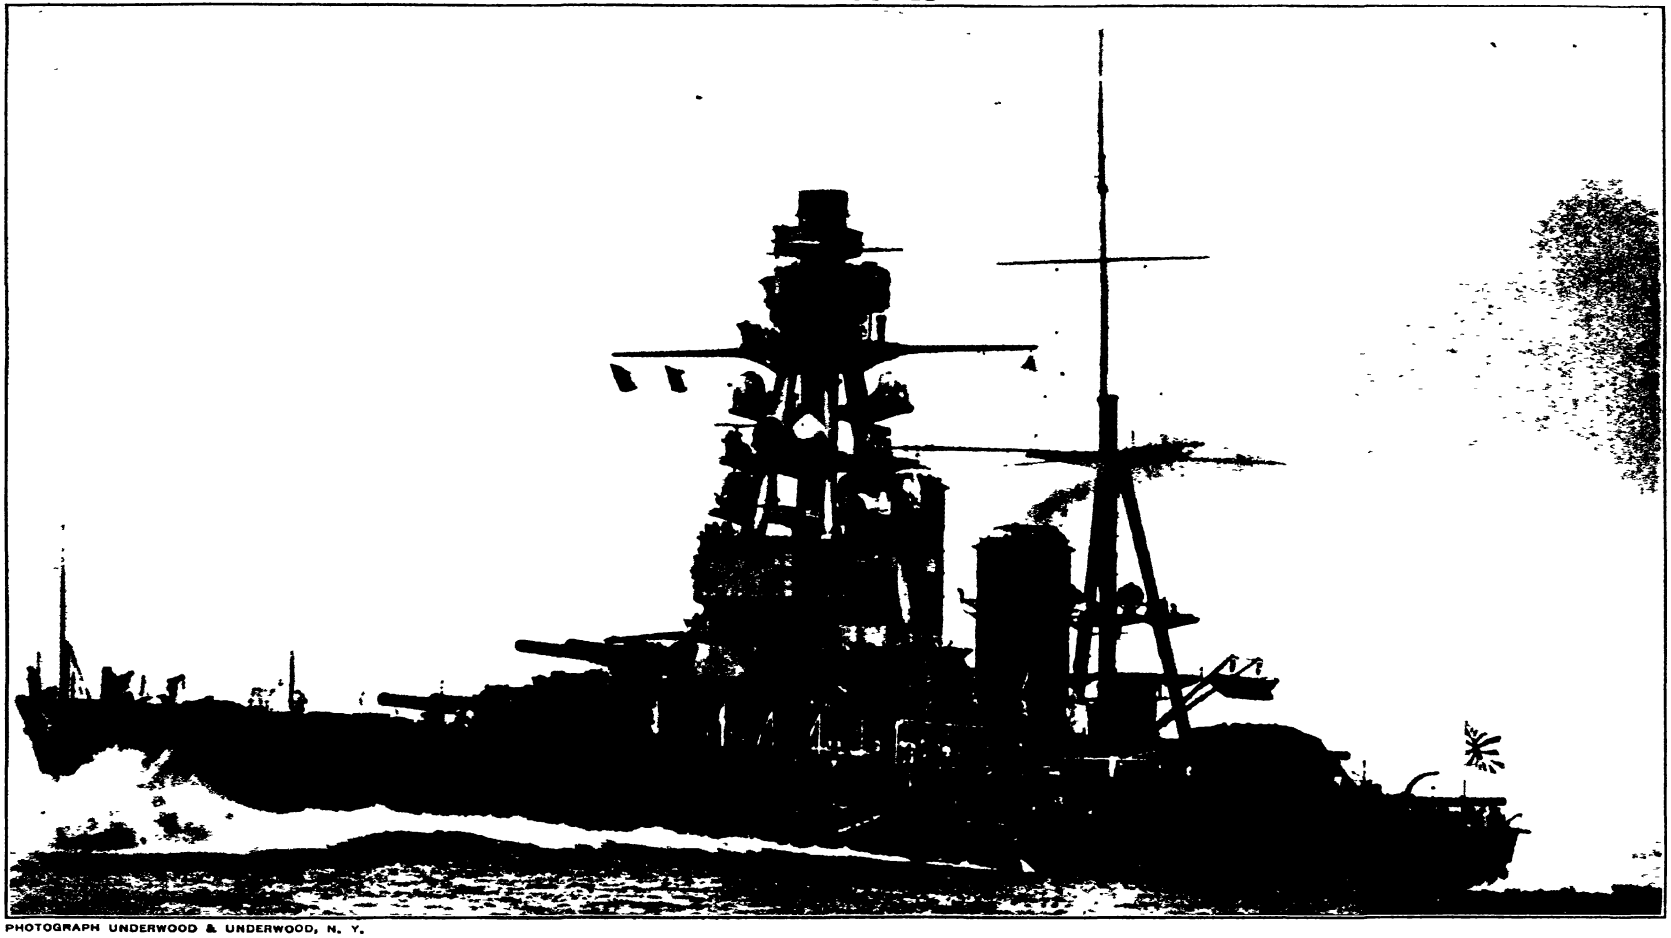


Japan. The naval budget for 1924 was 238,500,000 yen (1 yen = about $.41). Notwithstanding the damages inflicted by the earthquake, the vessels of the 1923–24 programme were to be laid down as soon as the various shipyards were free to undertake the work. This programme included: 4 light cruisers of 10,000 tons, 2 of 7100 tons; 18 destroyers of about 1500 tons; 16 submarines with submerged tonnages of 1500 to 2500 tons. All vessels of the programme were to be completed by 1928. On July 1, 1923, the following vessels were under construction: 1 light cruiser of 3100 tons, 5 of 5600 tons, 2 of 7100 tons; 7 destroyers of 1400 tons and 4 of 900 tons; 2 airplane carriers (ex-battle cruiser *Akagi* and ex-battleship *Kaga*); 4 gunboats of 338 tons; 5 auxiliary service vessels. The number of light cruisers completed, building, or authorized since 1918 was 25; all had speeds of 33 knots or more. The navy yard at Yokosuka was damaged by the earthquake to the extent of 35,000,000 yen, and other yards, public and private, were seriously injured. One of the greatest losses was that of the great oil storage tanks which held about 3,000,000 barrels. All the earthquake damages were being rapidly repaired, and the Yokosuka yard was to be ready to undertake shipbuilding work soon after June, 1924.

The Japanese fleet, including light cruisers and smaller vessels under construction, in 1924 consisted of 2 battleships of 33,800 tons (8 16-inch guns, 23.5 knots); 2 battleships of 31,260 tons (12 14-inch guns, 23 knots), 2 battleships of 30,600 tons (12 14-inch guns, 23 knots); 4 battle cruisers of 27,500 tons (8 14-inch guns, 27.5 knots); 3 armored cruisers of 9800 tons; 4 light cruisers of 10,000 tons (35 knots), 4 of 7100 tons (35 knots), 14 of 5600 tons (35 knots), 3 of 4950 tons (26 knots), 1 of 4100 tons (23 knots), 2 of 3500 tons (31 knots), 1 of 3100 tons (34 knots); 18 destroyers of 1500 tons, 7 of 1400, 22 of 1350, 6 of 1200, 25 of 900, 1 of 955, 18 of 835, 10 of 665, and 2 of 600. The details of Japanese submarines are rarely published There were said in 1924 to be about 80 boats including those already mentioned as belonging to the new programme of construction.

Netherlands. Several building programmes, including one in 1923, were submitted to the Netherlands Parliament, but all were rejected The vessels of the navy in 1924 consisted of 5 armored coast-defense ships of 5000 to 6500 tons (1903–1910); 2 new light cruisers of 7050 tons and 30 knots, 3 or 4 old cruisers of 4000 tons; 3 armored gunboats of 540 tons, many other gunboats at home and in the Dutch East Indies; 4 new mine-layers (1922) of 750 tons, 12 other mine-layers; 4 small mine-sweepers, 1 new submarine dépôt ship of 2500 tons; 8 destroyers of 480 tons; 8 torpedo boats of 322 tons, 7 torpedo boats of 130 to 190 tons; 11 submarines of about 700 tons, 3 of 380 tons, 5 of 150 to 234 tons, and 1 submarine mine-layer.

Norway. The naval budget for 1922–23 was 21,340,160 crowns (par value $0.268). Two submarines of 420 tons in 1924 were building in Norway. The vessels of the navy were 4 armored coast-defense ships of 3920 to 4233 tons; 1 small cruiser of 1350 tons; 9 gunboats of 190 to 620 tons; 3 destroyers of 540 tons; about 30 torpedo boats of 65 to 220 tons; 4 submarines of 255 tons, 2 submarines of 420 tons; and 3 new mining vessels of 335 to 755 tons.



Russia. The Russian navy by 1924 apparently was becoming less and less efficient, partly from lack of regular organization, partly from lack of intelligent control and care of vessels and equipment, and partly from lack of sufficient funds to keep the vessels and equipment in repair. One dreadnaught battleship was usually kept in commission and one in reserve: the other battleships and cruisers were unfit for service. A number of destroyers and submarines were kept in commission, but whether effective or not was unknown. Other vessels in service were mine-sweepers, mine-layers and ice breakers. Two divisions of destroyers were in commission in the Black Sea, but no large ves-

sels. Much attention was being paid to aviation, and efforts were being made to extend the service.

Spain. The naval budget for 1923–24 was 125,899,543 pesetas (par value = $0.193). It provided for an enlisted force of 13,000 in the seaman branch and 2550 marines. The vessels building in 1924 were: 2 light cruisers of 4725 tons and 29 knots, and 2 of 7975 tons and 33 knots; 3 submarines of 610 tons; 3 flotilla leaders of 1650 tons and 36 knots; 3 destroyers of 1145 tons and 34 knots; 3 gunboats of 1335 tons and 18 knots. In addition to the foregoing, the vessels of the navy in 1924 were: 2 dreadnaught battleships of 15,500 tons (8 12-inch guns, 19.5 knots), 1 old (1888) battleship of 9733 tons; 3 old (1898) armored cruisers of 7400 to 9900 tons; 1 old light cruiser of 5800 tons and 19.5 knots, 1 light cruiser of 5590 tons and 25 knots, 1 old light cruiser of 2100 tons and 19 knots; 5 gunboats of about 800 tons; 1 mine-layer of 1773 tons; 1 submarine salvage vessel of 2100 tons; 7 destroyers of 300 to 460 tons; 22 torpedo boats; and 10 submarines, 3 of them of 383 tons, 6 of 740 tons, and 1 of 685 tons.

Sweden. The navy of Sweden in 1924 consisted of 3 new armored coast-defense vessels of 7605 tons and 22 knots, 6 older ones (1901–07) of 3620 to 4700 tons and 16 to 18 knots, 7 others (1891–99) of 3400 to 3715 tons; 1 armored cruiser of 5000 tons and 22.5 knots; 1 mine cruiser of 1800 tons and 20 knots; 4 torpedo gunboats of 830 tons and 20 knots; 4 other small gunboats; 10 destroyers of 480 to 500 tons and 30 knots; 17 torpedo boats of 106 to 120 tons and 25 knots, 10 torpedo boats of 60 tons; 11 submarines of 370 tons, and 5 smaller submarines.

Turkey. The Treaty of Sèvres deprived Turkey of her naval force and nearly all her seacoast. The Treaty of Lausaune returned the most valuable parts of her seacoast as well as the remains of her fleet, consisting of the battle cruiser *Sultan Selim* (formerly the *Goeben*, 22,640 tons, 10 11-inch guns, 28 knots); the old battleship *Torgut Reis* (formerly the *Weissenburg*, 9900 tons, 6 11-inch guns, 17 knots); the old protected cruisers *Hamidieh* (3800 tons) and *Medjidieh* (3400 tons); 9 small torpedo boats of 100 to 200 tons; 9 gunboats of 200 to 500 tons; an armed yacht, and several motor boats. The vessels in 1924 were all in urgent need of repairs, which were to be made at the naval dockyard at Constantinople. This yard was being repaired, refitted, and improved by British shipbuilding companies.

United States. The only vessels under construction for the navy in 1924 were: 2 large aircraft carriers (*Lexington* and *Saratoga*, commenced as battle cruisers); 2 light cruisers of 7500 tons; 2 destroyer tenders; and 3 fleet submarines. The programme of new construction presented to Congress by the Secretary of the Navy consisted of 8 light cruisers of 10,000 tons, 6 light-draft gunboats for use on Chinese rivers, and 3 large submarines. The vessels of the navy in 1924 were: 3 battleships of 32,600 tons (8 16-inch guns, 21 knots), 2 battleships of 32,300 tons (12 14-inch guns, 21 knots), 3 battleships of 32,000 tons (12 14-inch guns, 21 knots), 2 battleships of 31,400 tons (12 14-inch guns, 21 knots), 2 battleships of 27,500 tons (10 14-inch guns, 20.5 knots), 2 battleships of 27,000 tons (10 14-inch guns, 21.5 knots), 2 battleships of 26,000 tons (12 12-inch guns, 21 knots), 2 battleships of 21,825 tons (12 12-inch guns, 21.5 knots); 3 armored cruisers of 14,500 tons, 5 of 13,680 tons, 2 of 9700 tons, 1 of 8200 tons; 10 light cruisers of 7500 tons and 34 knots, 3 of 3750 tons and 25 knots; 7 protected cruisers of 3200 to 3500 tons; 8 gunboats of 1000 to 1575 tons; 6 large mine-layers; 17 submarine and destroyer tenders; 2 aircraft carriers; 1 airship tender; 6 repair ships, 3 supply ships, 4 hospital ships, 25 fuel ships; also small gunboats, tugs, and miscellaneous vessels; 237 destroyers of about 1200 tons and 35 knots, 44 destroyers of 1000 to 1100 tons and 30 knots, 21 destroyers of 720 tons and 30 knots; and about 100 submarines.

The personnel of the navy in 1924 consisted of 7816 officers and 85,790 enlisted men. During the War there were 32,474 officers and 550,736 enlisted men. On June 30, 1923, there were 4222 officers in the Naval Reserve Force and about 11,000 men.

As regards matériel, the greatest needs of the navy in 1924 were: (a) repair of battleships; (b) more light cruisers; (c) some flotilla leaders; (d) large submarines for fleet service; (e) more aircraft The repair of battleships includes an increased elevation of the turret guns in all except the very latest vessels, the application of thin armor to the upper deck as a protection against aircraft bombs, the application of bulges and compartmentation below water as a protection against torpedoes, and a general repair and refitting of hull and machinery, particularly the latter In a spirit of mistaken economy, Congress and the demands of the budget cut the maintenance appropriations for the fleet until the sums allotted became wholly inadequate for the preservation of the vessels and machinery and still less adequate to secure efficiency. The deck armor, antitorpedo bulges, and the elevation of the guns were deemed necessary to place the battleships on the same plane of efficiency as the vessels of Great Britain and Japan. These repairs and changes could be effected without contravening the terms of the Five Power Naval Pact for the limitation of naval armaments. Compared with the British and Japanese navies, that of the United States in 1924 was particularly deficient in light cruisers. Of vessels of this type less than 10 years old, Great Britain had 47 of 243,240 tons and was building at least 7 more of about 10,000 tons each; Japan had 25 of 157,730 tons; and the United States had 10 of 75,000 tons. To preserve her parity with Great Britain, the United States needed 25 or more cruisers of 250,000 tons; and to hold her 5–3 ratio with Japan she needed 19 or more cruisers of 188,000 tons. Not less than 10 flotilla leaders and 10 large submarines were required. As to aircraft, the navy needed at least three times its force of 1924.

Fortunately for its efficiency, for its development along desired lines, and for its usefulness to the fleet and other naval purposes, the entire control of the naval air service was vested in the Navy Department. The Bureau of Aëronautics was established on Sept. 1, 1921. Before that date, naval aviation was divided between several different bureaus in a manner to prevent coördination of its various parts. The Bureau was carefully and thoroughly organized under its first chief, Rear-Admiral W. A. Moffett, and under his efficient guidance

the naval air service greatly improved and continued to gain as rapidly as the insufficient appropriations permitted. As a demonstration of the efficiency of the service, United States navy fliers established, in 1923, 23 out of the 42 recognized world's records for aircraft performance. In October, 1923, the Bureau completed the *ZR1*, the first rigid airship of the Zeppelin type to be built in America. Christened the *Shenandoah*, it was subjected to many tests and trials, all but one of which it passed satisfactorily; while riding at its mooring mast a 72-mile gale drove with such force that its whole bow was torn off. The ship nevertheless weathered the storm and after 9 hours returned and was nosed into her hangar. The *Shenandoah* is 680 feet long, has a diameter of 78.7 feet, a gas capacity of 2,150,000 cubic feet, and is filled with helium. It is driven by 6 300-horse power Packard engines with a maximum speed of 75 miles per hour and a cruising speed of 65 miles The crew consists of 9 officers and 22 men. For sectional diagram and illustration, see AËRONAUTICS Another airship of the Zeppelin type was built in Germany and was ready for delivery in 1924 It was styled the *ZR3*. It is 656 feet long, 90 feet 9 inches in diameter, and has a gas capacity of 2,475,000 cubic feet. In addition to rigid airships, the air service was equipped with nonrigid dirigibles, kite balloons, free balloons, seaplanes, airplanes of land types, torpedo-planes, etc. One of the most interesting of the seaplanes was the *MS1*, designed for use by submarines. It had an all-metal body and was of such small dimensions that with wings folded it could be stowed in a little compartment immediately below the deck of the submarine. This compartment was not water-tight, but water would not injure the plane It could be hoisted out and made ready in a few minutes. It takes off from the water and on return descends to the surface alongside the submarine. See VESSEL, NAVAL; BOMBING OF VESSELS; WAR IN EUROPE, *Naval Operations*

NAVIGATION. The art of navigation was greatly improved in the decade 1914–24 by the invention of new devices and the further development of old ones. The net result was increased safety for shipping, especially in the vicinity of land, and greater ease and economy in handling it everywhere. The most noteworthy of the devices were the radio compass, sonic sounding, the gyro-pilot, cable steering, the earth induction compass, and the auxiliary rudder.

Radio Compass. This is a device for the reception of the electromagnetic waves used in radio telegraphy and for determining the direction of their source. Its operation is based on the fact that radio waves have most effect on an antenna or loop when its plane is in the direction of the propagation of the waves If the waves are not deflected by intervening land or other objects, the plane will point toward the source. Great care is taken to prevent such deflection, but some always exists. This is eliminated from the final result in well-placed and carefully screened stations by determining a curve of error which gives the proper correction to apply to each observed bearing. The compass itself consists of a vertical coil pivoted on a vertical axis rising from the centre of a dumb compass which is set with its zero pointing north. The operator rotates the vertical coil until in the position which gives the minimum of sound in the head 'phone. The pointer over the dumb compass then gives the direction of the transmitting station, subject to correction for error. Radio compasses are installed on board ship as well as ashore, but the shore stations give the best results, as the deflecting objects on large vessels are numerous and troublesome. A ship may thus determine the direction of a shore station, or a shore station may determine the direction of a ship and give her the information by radio. Simultaneous reports from two shore stations may be plotted on a chart; gnomonic projection must be used if over 50 miles away; and the exact location of the ship may be determined, a most important matter in a heavy fog. A large number of shore stations, established on the east and west coasts of the United States and on the Great Lakes, are of great use in foggy weather or when a ship is beyond visual range of definable shore objects but within 150 miles of a compass station.

Sonic Sounding. Deep-sea sounding was until late in the decade effected by means of a long wire and a detachable sinker. The sonic sounding apparatus or automatic depth recorder was developed and perfected by Dr. Harvey C Hayes, sound aide and physicist of the Naval Experiment Station at Annapolis, Md It consists of an oscillator mounted in a tank in the stern of the ship and a hydrophone installed in the bow. Wires from both lead to the bridge or charthouse. Oscillator sound signals are made by the operator. The sound wave, traveling about 4840 feet per second, goes to the ocean bed, is reflected back, and is caught by the hydrophone receiver which measures the elapsed time. This time interval, referred to a scale, gives the depth in fathoms The United States Navy was the first to put the device to practical use. The U.S.S. *Stewart* ran a line of soundings from Newport, R. I., to Manila, P. I., and other naval vessels did similar work in the Atlantic and Pacific Oceans Apparatus of this sort will probably be applied in the near future to all large vessels as its value is so great they cannot afford to be without it.

Earth Induction Compass. This is an instrument devised by Dr. L. J. Briggs and Dr. Paul R. Heyl of the United States Bureau of Standards. It is a development of their airplane compass but is larger and driven by an electric motor instead of wind cups. Two direct currents are generated by revolving two pairs of brushes at a velocity of 1400 revolutions per minute in the magnetic field of the earth. The instrument is so adjusted that when it is set for a compass bearing, the currents flowing from both pairs of brushes are equal and produce no effect on a galvanometer. If the instrument turns even slightly, one current becomes stronger, and the dial needle is deflected. On board ship the generator is placed aloft or as far as possible from the magnetic field of the ship, but the control is in any convenient location This compass, including its fittings, is comparatively inexpensive.

Radio Pilot Cable. A method of keeping a ship in the channel during a heavy fog was tested in the Ambrose Channel leading into the New York harbor. It consists of an electric cable through which flows an alternating current. Ships intending to use the cable are provided with a pair of coils, each connected to a galvanometer.

By noting when the currents in the coils are equal, the navigator can determine when he is astride the cable and can keep over it. For regular service two cables are laid, one for incoming and one for outgoing vessels, carrying currents of different frequency.

Gyro-Pilot. This apparatus, designed and developed by Elmer A. Sperry, the inventor of the Sperry gyro-compass, is a device for automatically steering a ship on any desired course. The course is set on the gyro-compass, and the gyro-pilot not only takes the place of the helmsman in steering but notes each yaw of the vessel as it begins and anticipates the movement by helm change more quickly than a helmsman can. Moreover, it takes cognizance of the speed of the yaw, when increasing and when dying away, and corrects the rudder angle accordingly. The sum total of its efficiency is considerable. It reduces the angle of yaw and the necessary helm angle, on both counts effecting an increase of speed with the same power, and in reducing the yaw cuts down the distance which the ship travels in steering a course between two fixed points

Flettner Rudder. This is a German invention designed to do away with expensive steering gears and to replace them by a simple form of rudder worked by the streamline pressure exerted on the rudder by the water through which the vessel is moving. This is accomplished by a small auxiliary rudder or deflector which is set in a long jog in the after edge of the main rudder and operated independently of it. The combined effect of the deflector and the current of water imparts to the main rudder a large turning movement enabling it to act with prompt and efficient steering effect.

NEAR EAST RELIEF. An organization incorporated by Congress in 1919 for the purpose of affording relief to sufferers in Armenia, Syria, the Russian Caucasus, Mesopotamia, Egypt, Palestine, Macedonia, and other countries. Conditions in these countries in 1919 were characterized by Herbert Hoover as "the most desperate in the world." This was largely due to the fact that the Red Cross did not maintain any relief system in them. The organization succeeded the Armenian and Syrian Relief Commission. Over 7000 tons of flour were distributed per month. It was reported that there were 1,200,000 destitute adults and 250,000 homeless children in the areas affected. Col. William N. Haskell assumed charge of all operations and expenditures in 1919. In 1920 the work of the organization extended from Egypt to the Caucasus and from Constantinople to Mesopotamia and Persia. From northern Turkey, over 500,000 Armenians had escaped to the Russian Caucasus; they were in a destitute condition. In Egypt and elsewhere, hundreds of refugees had settled, and in Persia, as a result of famine in 1917–18, thousands were suffering for the necessities of life. By the end of 1920 more than $42,000,000 had been spent by the organization. The work represented the literal saving from death of hundreds of thousands. The largest and most important service was the work among the children. In 1920 the organization cared for more than 100,000 children, the majority of them in orphanages and the others in soup kitchens and clinics. Conditions were intensified by the fighting in the Caucasus and western Turkey in 1921. Down to the end of 1922 it was estimated that 1,000,000 women and children had been saved from starvation through the efforts of the Relief. Three hundred American workers were employed, besides hundreds of native helpers. At the end of 1922 38 hospitals, 59 clinics, and 124 orphanages were maintained. The total expenditure to July, 1924, was about $78,000,000. Invaluable service was rendered at the destruction of Smyrna, where assistance was given to the thousands of refugees escaping to Greece and elsewhere. In 1923 the Near East Relief concentrated its activities on a child-welfare programme. During the year, on account of the forced evacuation of minority populations at Anatolia, emergency work for adult refugees was carried on at Mediterranean and Black Sea ports. This included feeding and medical service and resulted in the saving of at least 100,000 lives, chiefly of women and children. Over 22,000 orphans were safely transferred from the interior of Anatolia to new institutional homes in Syria, Palestine, and Greece.

In 1924, the organization was operating 39 orphanage centres and 62 hospitals and clinics in six countries. Its agricultural demonstration projects in Syria, Greece, and Armenia employed 23,000 acres. Industrial training schools in Syria, Greece, and Palestine were teaching 35 trades to 30,000 children.

NEBRASKA. Nebraska is the fifteenth State in size (77,520 square miles) and the thirty-first in population; capital, Lincoln. The population increased from 1,192,214 in 1910 to 1,296,372 in 1920, a gain of 8.7 per cent The white population rose from 1,180,293 to 1,279,219; negro, from 7689 to 13,242. The State has a very large proportion of native white inhabitants, and these increased from 1,004,428 in 1910 to 1,129,567 in 1920. The foreign-born whites, on the other hand, decreased from 175,865 to 149,652. Both urban and rural populations showed an increase, the former from 310,852 to 405,306, and the latter from 881,362 to 891,066. The growth of the principal cities was as follows. Omaha (q.v.), 1910, 124,096; 1920, 191,601; Lincoln, 43,973 to 54,948; Grand Island, 10,326 to 13,947.

Agriculture. As Nebraska is one of the great agricultural States, conditions in the decade 1910–20 reflected the fluctuations in prices and production which resulted from War and post-war conditions. (See AGRICULTURE.) While the population of the State in the decade increased 8.7 per cent, the number of farms decreased 4.1 per cent (from 129,678 in 1910 to 124,417 in 1920). The acreage in farms in 1910 was 38,622,021, compared with 42,225,475 in 1920, an increase of 9.3 per cent; the improved land in farms likewise showed an increase from 24,382,577 acres to 23,109,624, or 5.2 per cent. The percentage of land used for agricultural purposes increased from 78.6 in 1910 to 85.9 in 1920, but the percentage of improved farm land fell from 63.1 to 54.7 per cent. The total value of farm property showed an apparent increase from $2,079,818,647 to $4,201,655,992, or 102 per cent; the average value per farm, from $16,038 to $33,771, or 110.6 per cent. In interpreting these values and indeed all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of

the total of 124,417 farms in 1920, 69,672 were operated by owners, 1315 by managers, and 53,430 by tenants. The comparative figures for 1910 were 79,250, 987, and 49,441. White farmers numbered 124,033 in 1920 and 129,216 in 1910, the native white farmers increasing from 93,509 to 99,441, while foreign-born farmers decreased from 35,707 to 24,592. Of the 384 colored farmers in 1920, 260 were Indians. Farms free from mortgage in 1920 numbered 27,065, compared with 47,435 in 1910; those under mortgage, 35,191, compared with 30,839. The number of dairy cows in 1920 was 516,716, compared with 613,952 in 1910, a decrease of 15.8 per cent; "beef cows," 1,121,564, compared with 705,191, or an increase of 59 per cent; hogs, 3,435,690, compared with 3,435,724; sheep, 573,217, compared with 240,116 The estimated production of the chief farm crops in 1923 was as follows· corn, 257,418,000 bushels; spring wheat, 3,560,000; winter wheat, 28,220,000; oats, 86,977,000; rye, 1,584,000; barley, 9,586,000; potatoes, 9,912,000; hay, 3,352,000 tons; and sugar beets, 541,000 short tons Comparative figures for 1913 are: corn, 114,150,000 bushels; wheat, 62,325,000; oats, 59,625,000; rye, 1,740,000; barley, 1,760,000; potatoes, 5,664,000; and hay, 1,675,000 tons. The apple crop in 1919 was 907,224 bushels valued at $1,905,175, as compared with 3,321,073 bushels valued at $1,612,765 in 1909.

Manufactures. Nebraska is not one of the leading manufacturing States It has, however, five cities with more than 10,000 inhabitants, which in 1920 contained 21.8 per cent of the State's total population and in 1919 reported 81.7 per cent of the State's manufactured products. There were in the State, in 1909, 2,500 manufacturing establishments; in 1914, 2492; and in 1919, 2884. Persons engaged in manufacture numbered 31,966, 33,695, and 49,076; and the capital invested amounted to $99,901,089, $121,007,944, and $245,256,684, in those years. The value of the products in 1909 was $199,018,579; in 1914 $221,615,848; and in 1919, $596,042,498. The large increase in value of the products between 1914 and 1919 was due largely to the change in industrial conditions brought about by the War and cannot properly be used to indicate the growth in manufactures; but the increase in number of wage earners and in number of establishments indicates clearly a decided growth in the manufacturing activities of the State. The principal manufacturing city is Omaha, which had, in 1909, 432 manufacturing establishments, with a product valued at $60,855,000; 1914, 417, with $66,438,000; and in 1919, 561 with $452,237,000. Lincoln is also important industrially, having, in 1909, 167 manufacturing establishments, with a product valued at $7,010,000; in 1914, 195 with $10,025,000; and in 1919, 210 with $23,368,000.

Education. The passage of several legislative acts during the decade 1914–24 did much to improve educational conditions in Nebraska. This is especially true of the latter part of the period. The Legislature of 1919 passed a certification law standardizing the issue of teachers' certifications by establishing specific legal requirements; a law redistricting the State for the purpose of forming consolidated school districts; and a third making citizenship a necessary requirement for teachers in all public, private, denominational, and parochial schools. The Legislature of 1921 made it mandatory for every school district of the State to provide a minimum term of 9 months when it can be supported on a levy of $.008 on $1 of the actual assessed valuation of the school district. The four State normal schools were designated as teachers' colleges by the 1921 Legislature and were authorized to confer the bachelor's degree on students completing the four years' college course. Midland College changed its location from Atchison, Kan., to Fremont, Neb., and Bellevue College, formerly at Bellevue, Neb., was discontinued. The average daily attendance in the schools in 1923 was 253,955, compared with 214,152 in 1914. The total expenditure for public schools for 1923 was $29,935,549. Illiteracy in the State decreased from 2.5 per cent in 1910 to 1.8 per cent in 1920: among the native white population, from 0.8 to 0.5; among the foreign-born white, from 7.1 to 6.6; and among the negro, from 8.5 to 5.7.

Finance. For finance, see STATE FINANCES.

Political and Other Events. During the decade 1914–24, Nebraska was one of the doubtful States, and control was balanced closely between the Democratic and Republican parties. In 1914 John H. Morehead, the Democratic candidate, was elected governor, and the Democrats elected their candidates for Congress in three districts and the Republicans theirs in the others. A woman suffrage amendment was defeated in this election, and so were several other proposed amendments. In 1916 the State was Democratic, both nationally and locally. Keith Neville, Democratic candidate, was elected governor, and Gilbert M. Hitchcock was reelected to the Senate. In the voting for President in this year, President Wilson received 158,827 votes; Charles E. Hughes, 117,771. At this election a prohibition amendment was carried At State elections in 1918, the Republican nominees were elected to the Legislature by large majorities. Samuel R McKelvie was elected governor. An amendment to the constitution was adopted, depriving so-called "first paper declarants," six months resident in the State, of the right to vote. The voters also decided in favor of holding a convention to draft and submit a new State constitution. In October, 1919, there was serious rioting in Douglas County during which the county court house was damaged by fire, with a loss of nearly $1,200,000. The trouble arose from the attempts of the mob to force the sheriff to turn over to them a negro prisoner. The negro was seized by the mob and hanged. In 1920 Governor McKelvie was reëlected. In the voting for president in this year, Warren G. Harding received 247,498 votes; James M. Cox, 119,608. During 1920 a constitutional convention adopted 41 amendments to the constitution which were voted on in a special election on September 22. The most important of these amendments were as follows: The English language was required as a teaching medium in all common schools. The governor was given the power to appoint heads of the executive department, with the consent of the majority of both houses. A budget system was created. The concurrence of five out of seven judges of the Supreme Court was made necessary for declaring a law unconstitutional. No appropriations are made to educational institutions not owned and controlled by the State. In the elections of 1922,

the Democrats were successful. Charles W. Bryan, brother of William J. Bryan, was elected governor. Robert B. Howell, Republican candidate, was elected United States Senator, defeating Gilbert M. Hitchcock, Democrat. The Republicans elected a majority in both houses of the Legislature. Governor Bryan was inaugurated in January, 1923. In the nominating primaries in 1924, Senator Norris, Republican, was renominated. Charles W. Bryan was renominated by the Democrats for governor and Adam McMullen by the Republicans.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. The Legislature of 1917 arranged for the submission of an amendment providing for a revision of the State constitution. The right of women to vote was affirmed for all elections not already specified in the State constitution. Provision was made for the election of the judiciary and certain school officers by nonpartisan ballots. A special session of the Legislature was held in 1918 to deal with issues arising from the War. The so-called Mockett Law, under which the teaching of German was made compulsory in the schools, was repealed. The Legislature in 1919 passed a measure consolidating several boards and commissions under the governor, with the purpose of unifying the administration and doing away with duplications and overlapping jurisdiction. The banking laws were amended and so were the "blue sky" law and the workmen's compensation law A bill was passed for the erection of a new State capitol. The Legislature ratified the Federal prohibition amendment, Jan. 16, 1919, and the Federal woman suffrage amendment, Aug 2, 1919. The Legislature of 1921 passed measures designed to prohibit aliens' acquiring title to land in the State; provided for the preparation and presentation of a State budget and for the establishment of coöperative associations; and declared English the official language of the State, prohibiting discrimination against its use by religious and social bodies. The school age was raised from 14 to 16 years under certain conditions and the age of minority for women to 21 years. A special session of the Legislature was held in April, 1922, to reduce the appropriations made by the Legislature of 1921, in order to avoid the excessive collection of taxes. The total amount of reductions made was about $2,500,000. In 1923 the Legislature passed a measure forbidding the marriage of persons afflicted with certain diseases.

NEBRASKA, University of. A coeducational State institution at Lincoln, Neb, founded in 1869. With the exception of the war years the student enrollment increased steadily from 4133 in 1914 to 5051 in the year 1923–24, with 2569 in the summer session of 1923, not including students of noncollegiate rank and those enrolled in extension courses. The faculty increased correspondingly during the period from 283 to 368 members, and the library from 111,000 to 175,000 volumes. The income of the university rose from $1,000,000 to approximately $3,000,000. Many new buildings were put up. An animal pathology laboratory was built in 1918 and a special State appropriation made available for research in animal diseases. During 1919 and 1920 the following buildings were erected or acquired: on the city campus, Social Sciences Hall, Teachers' College building, Ellen Smith Hall, the chancellor's residence, seven students' houses; on the farm campus, an agricultural engineering building and an animal pathology and hygiene building and a barn; at the Medical College at Omaha, a new laboratory building, nurses' home, and a steam plant. A photographic studio was also added in 1921 and in 1923 a beef cattle barn and a new stadium for athletics and public exercises. Chancellor, Samuel Avery.

NEGRO IN AMERICA. See Negro Migration; United States, *Population;* Lynchings; and Race Problems in the United States

NEGRO MIGRATION. Following 1916, the northward movement of the southern negro, which had been fairly constant from the close of the Civil War, showed a remarkable increase. Previous to that year negroes in the North had been entirely excluded from most occupations; about three-fourths of the colored workers were employed in domestic personal service; they commanded only poor wages and were largely shut off from the benefits of labor organization. With war-time conditions came a marked broadening of their industrial opportunities. On account of the labor shortage produced by the check to European immigration and the expansion of industry to meet war-time demands, northern employers found themselves compelled to take on negro labor This was, beyond question, the immediate cause of the conspicuous growth in the migration northward. At the same time unrest among negroes in the South and other influences contributed to this movement. In 1918 the total northward migration for the preceding few years was placed between 500,000 and 600,000. This wholesale movement was checked for a time after the War came to an end, although many negroes insisted on coming North even when they were warned that only unemployment awaited them It began again in 1921 and increased through 1922 and 1923. In addition to his war-time experience, the negro had been used to a limited extent as strike-breaker in the steel, building trades, railroad shop, and packing house strikes, where he had an opportunity to prove and to learn his value in industry. Whereas in the South 57.7 per cent of the total number of male negro workers were employed in agriculture, only 5.7 were so engaged in the North in 1920. Moreover, instead of working in hotels, restaurants, office buildings, and domestic kitchens, most of them had become industrial laborers in mills, factories, and stockyards. In Chicago the negro was represented by large or small numbers in practically all the principal occupations. In some cases they had risen to foremanship over men of their own race. Negro women, to a less extent, were being employed in a widening variety of industrial processes. Although in general negroes were not admitted to unions and were employed at lower rates than white workers, in some cases they were asking equal pay for equal work and were joining trade unions where these were open to them. More than all this, perhaps, the negro was finding in the North a freer social and political life with increased educational advantages.

This increased northward migration continuing, the farm labor situation in the South became alarming by the spring of 1923. A temporary reduction in the crop acreage was found necessary. The United States Department of Agriculture, on investigation, found that Georgia had lost, within a year, 32,000 negro farm workers, or 13 per cent of the total number of negro farm workers in that State; Alabama had lost 10,000 or 3½ per cent; South Carolina, 22,700, or 3 per cent; Arkansas, 15,000, or 3½ per cent; Florida, 2, and Louisiana, 1 per cent; besides the negro workers who had been lost to mining, lumbering, manufacturing, and domestic service. According to a study of the census figures, made by the United States Bureau of the Census, the net direct loss to the South through negro migration up to the year 1920 had been 733,571, or approximately 8 2 per cent of its total negro population. The first measure taken in the South to check the movement was rigorous legislation to control emigrant labor agencies; payment of a license fee was required, in some cases as high as $2500, with jail sentences for evasion. The attempt was ineffectual. Higher wages on farms and in factories were offered, improvements were made in school and housing conditions, and efforts were put forth toward securing for the negro equality before the law and an abatement of mob violence, and for some measure of social coöperation between the races. All of this resulted in a betterment of conditions for the negro who remained, but the marked movement to the North continued. The number leaving the South in the year ending Sept. 1, 1923, according to the Department of Labor, was 478,100; the loss by States was as follows: Georgia, 120,000; Alabama, 90,000; Florida, 90,000; Mississippi, 82,600; North Carolina, 25,000; South Carolina, 25,000; Louisiana, 15,000; Tennessee, 10,000; Virginia, 10,000; Arkansas, 5000; Kentucky, 2500; Texas, 2000; and Oklahoma, 1000. To a much larger extent than ever before, the migration came from the far South. Latterly an increasing number of Mexicans were being brought in to meet the farm labor shortage.

The effect of this migration on the population of the North was conspicuous in the census figures. From 1870 to 1910, the average decennial increase of southern negroes in the North was 67,000; in 1910–20 the increase was 321,890, or more than the aggregate increase of the preceding 40 years. In 1910 the negroes had constituted about 1.9 per cent of the total population of the North, at which point it had been fairly constant since 1870; in 1920, their proportion had increased to 2.3 per cent. This increase, however, though striking, was not enough in itself to make the negro a disturbing factor in the North. Where trouble arose it was from the unequal distribution of the negro population. Nine States, holding 72.7 per cent of the total population of the North, accounted for 91.4 per cent of the total negro population of that territory (Pennsylvania, 284,568; New York, 198,483; Ohio, 186,187; Illinois, 182,724; Missouri, 178,241; New Jersey, 117,132; Indiana, 80,810; Michigan, 60,082; Kansas, 57,925). Most serious was the concentration in the large cities; New York, Chicago, and Philadelphia, for example, contained 26.9 per cent of the northern negroes, as compared with 15.9 per cent of the total population. The influx of negroes to the larger cities appeared to be taking on flood proportions. In protest against the employment conditions resulting from the movement, East St. Louis rioted in 1917. Serious race riots broke out in Chicago, in 1919, in which there were killings on both sides. There were disturbances in Omaha and Washington. These outbursts of race feeling were precipitated largely, it was claimed, by sensational newspaper publicity, and in Chicago in particular by the difficulties of insufficient housing. It being realized, however, that lack of understanding and coöperation between the races was the crux of the situation, and that this was only being aggravated by political as well as social segregation, there was appointed in 1918, under the Federal Department of Labor, a director of negro economics, to ease the friction. Negro advisory committees, composed of representative white and colored citizens, were established throughout the South and in various northern centres, constituting agencies in which the two elements might work together toward a mutual understanding. In industry, the negro immigration was in a limited measure taking the place of the foreign-born as a source of labor supply for shops and factories. There had been fewer cases of open hostility between white and colored labor than had been anticipated; requests for separate facilities had not been frequent The American Federation of Labor made an effort to prevent the drawing of the color line in the unions; and when several international and local unions refused to accept this principle, it provided in 1920 that where internationals refused to admit colored workers to membership, organization would be authorized under a charter of the Federation. The Federation also sent an organizer to work among the negroes in the South. The attitude of the white worker in general seemed to be that while he was averse to the negro in industry, still, since the negro had come, it was better to have him organized. It was noteworthy that during the Chicago riots, the organized white workers in the packing houses guaranteed that there would be no trouble between them and the negro workers. See LYNCHINGS.

NEIHARDT, JOHN GNEISENAU (1881–). An American writer, born at Sharpsburg, Ill. He studied at the Nebraska Normal School and from 1901 to 1907 lived among the Omaha Indians to study their character and history. His books include *The Divine Enchantment* (1900); *The Lonesome Trail* (1907); *The Dawn Builder* (1911); *The Quest*, poems (1916); *The Song of Three Friends* (1919); and *Two Mothers*, a drama (1921). *The Song of Three Friends* was awarded a prize by the Poetry Society of America as the best volume of verse of 1919. He edited several collections of verse and contributed frequently to magazines. From 1912 he was literary critic of the Minneapolis *Journal*.

NEJD, EMIRATE OF. See ARABIA.

NELSON, KNUTE (1845-1923). An American lawyer and legislator (see VOL. XVI). He was a member of the Senate for five successive terms and was reëlected for the term ending 1925. At the time of his death, on Apr. 28, 1923, he was the oldest member of that body in point of service. He died on Apr. 28, 1923.

NEO-LAMARCKIAN THEORY. See HEREDITY.

NEPHRITIS. Ideas of the nature of

Bright's disease underwent much change in the decade 1914–24. Thus it was pretty well shown through experiment that nephritis does not represent a poisoning through the exposure of the organs in eliminating toxic material. This kind of injury, which may be studied in actual poisoning by mercury and oxalic acid, bears no resemblance to ordinary nephritis. The latter may usually be traced to a focus of infection somewhere in the body, as in the teeth or tonsils, while the organs are also attacked by the germs and their toxic products in various general infections. No doubt dietetic and other abuses may lower the resistance of the organs to infection. Passage of the prohibition amendment in the United States had not secured any lowering of the mortality of Bright's disease up to 1924, and it must be borne in mind that chronic disease of vital organs late in life is common among the clergy as well as in other abstinent classes of mankind.

The old distinction between medical and surgical nephritis is no longer upheld, for a unilateral nephritis, once thought to be the necessary result of mischief lower down in the urinary tract, may be found due to a blood infection. There seems to be very little difference between the causal factors in nephritis proper and those of disease of the kidney and the pelvis, perinephritis, and even stone in the kidney; for focal infection may be traced in all of them. Under diagnosis the practice of microchemical analysis of the blood will give the best idea of the functional efficiency of diseased kidneys. Convulsions seen in uræmia are no longer regarded as the result of retained toxic material in the blood but as that of increase in intracranial pressure. For the relief of nephritis wonders may be accomplished by proper diet, as in the case of the disappearance of dropsy on a diet very poor in salt

NERNST DISTRIBUTION LAW. See CHEMISTRY, PHYSICAL.

NERNST HEAT THEOREM. See CHEMISTRY, PHYSICAL.

NETHERLANDS, THE, or HOLLAND. A kingdom situated on the North Sea, lying between the Kingdom of Belgium on the south and west and Germany on the east. Its area is 13,205 square miles, of which 617 consist of water. The population in 1923 was 7,086,913 (49.64 per cent male and 50 36 per cent female), an increase of 109,483 over the census of 1921 and 221,599 over that of 1920. The density of population per square mile amounted to 652.99 The urban population constituted 45.66 per cent of the whole, and the rural 54.34 per cent. Emigrants in 1922 amounted to 2158, of whom 1912 departed from Dutch ports for North America, 195 for South America, and 47 for Africa. The royal family and most of the inhabitants were members of the Reformed Church, which was under Presbyterian government, but complete liberty of conscience was granted to all religions. At the end of 1920, there were 2,826,633 adherents of the Dutch Reformed Church; other Protestants numbered 832,164; Catholics, 2,444,583; Jansenists, 10,461; Jews, 115,222; other known creeds, 635,241. The chief cities with their population in 1923 were: Amsterdam, 700,303; Rotterdam, 535,033; The Hague, 367,667; Utrecht, 146,976; Groningen, 94,217; and Haarlem, 80,383.

Agriculture. The total area of agricultural land (in hectares; 1 hectare = 2.47 acres), in 1922 was 2,229,413 (in 1913, 2,186,591); arable land, 902,266 (27.61 per cent; 882,255 hectares in 1913); meadows, 1,231,052 (37.67 per cent; 1,221,876 in 1913); gardens and orchards, 96,095 (2.94 per cent; 81,460 in 1913); forests, 248,208 (7.6 per cent; 257,939 in 1913); uncultivated land, 466,066 (14.26 per cent; 515,143 in 1913).

PRINCIPAL CROPS, 1922

(1 bushel = .35238 hectoliter)

	Hectares 1922	Hectoliters 1922	Hectoliters 1915
GRAINS			
Oats	159,441	6,279,000	7,292,000

against 197,615 in 1922; this, too, was exported principally to Great Britain.

Mining and Manufacturing. Mining was limited in the Netherlands to coal mining in the province of Limburg. The coal production was estimated at 5,500,000 metric tons for 1923, against 4,570,000 for 1922 and 3,018,000 in 1917. In 1923 there were 933 dairies. The production of butter in 1922 amounted to 64,633,000 kilograms, and of cheese, 97,621,230 kilograms. The beet sugar refineries numbered 21 in 1922, while the total sugar production amounted to 175,331 metric tons for 1922–23. In 1922 there were 33 potato flour factories, 18 cardboard factories, and 16 margarine factories. The latter produced 87,902,720 kilograms of margarine.

Communications. Length of railways in 1923 was 3671 kilometers; in 1922, 3428; in 1910, 3215. The estimated receipts were 120.43 florins per kilometer for 1923, as against 130.87 florins for 1922. In 1923 there were 666 steamers (2,398,618 gross registered tons), against 664 for 1922 (2,164,739 gross registered tons); motor and motor sailing vessels, 80 (63,940 gross registered tons), against 73 for 1922 (51,351 gross registered tons).

TONNAGE ENTERED AND CLEARED AT ROTTERDAM AND AMSTERDAM (1923)
(In cubic meters)

	1922	January–November, 1923
Total Entries	44,099,955	40,669,545
Rotterdam	33,792,324	29,865,048
Amsterdam	8,509,459	8,817,824
Total Clearances	28,468,683	28,485,391
Rotterdam	21,435,815	20,876,426
Amsterdam	5,513,201	6,040,892

RIVER SHIPPING (1923)
(In 1000 kilograms)

	1922	January–November, 1923
Total Entries	16,931,645	11,105,351
Through Lobith	10,361,740	5,193,379
Total Clearances	21 972,497	16,061,245
Through Lobith	13,241,713	7,691,242

Idle tonnage at the end of 1923 totaled 38 ships (221,000 gross registered tons) against 76 (317,000 gross registered tons) for 1922 The movement of merchandise, in metric tons, was as follows:

	1922	1923
Total		38,345,769
By ocean		23,294,849
By river and canal		16,050,920
Rotterdam:		
Total	31,016,337	23,658,178
By ocean	18,981,585	15,677,725
By river and canal	12,034,752	7,980,453
Amsterdam:		
Total	5,354,990	5,111,925
By ocean	4,120,727	4,230,243
By river	1,234,263	881,682

Commerce. The foreign trade in 1923 totaled, in imports, 2,009,225,705 guilders, against 2,027,598,760 for 1922 and 608,357,000 in 1918. Exports showed 1,303,220,602 guilders, against 1,221,231,211 for 1922 and 381,210,000 in 1918. Transit trade showed 8,767,840 metric tons against 13,296,287 for 1922.

PRINCIPAL IMPORTS AND EXPORTS

FOREIGN TRADE BY COUNTRIES

Countries	(in 1000 guilders) Imports from 1922	1923	Exports to 1922	1923
Germany	608,437	494,868	167,775	186,790
Great Britain	323,569	308,222	302,969	359,600
United States	270,799	256,017	62,094	69,452
Belgium	187,966	215,260	174,176	139,328
Dutch East Indies	102,373	114,184	127,382	110,850
France	57,290	68,744	114,525	126,115

Leading imports from the United States for 1923 (in 1000 guilders) were wheat, 33,970; raw cotton, 28,092; corn, 22,157; linseed cake, 20,092; wheat flour, 20,992. Leading exports to the United States were flower bulbs, 9560; rubber, 3885; silk, artificial yarns, 3590; quinine and other salts, 3018; chincona bark, 2392.

Finance. The national debt, consolidated (Jan. 1, 1923), was 2,828,319,550 guilders; floating (December, 1923), 648,856,000 guilders, of which 102,256,000 were advanced to the colonies, against (December, 1922) 805,937,000 guilders, of which 323,750,000 were advanced to the colonies.

NATIONAL BUDGET, 1923 AND 1924
(Estimated)
(In 1000 guilders)

Year	Ordinary	Extraordinary	Crisis	Total
Expenditure				
1923	620,397	183,999	3,829	808,225
1924	646,892	112,634	5,737	765,264
Revenue

Decrease	39,903	25,355	17,976	83,234

The following indicates currency in circulation:

Date	Gold	Silver	Note Circulation
Dec 31, 1922 . .	581,790	9,074	969,251
Dec 31, 1923 . .	.581,787	8,674	1,031,279
Feb. 4, 1924 . .	.581 713	10,120	1,030,419

The exchange for the dollar (par, 2.488 guilders to $1) was in December, 1922, 2.51; in December, 1923, 2.63; on Feb. 2, 1924, 2.65. The wage index (January, 1914 = 100 for five cities and 14 classes of workers) was 246.4 for July, 1923, against 265.2 for July, 1921, and 252.3 for January, 1923 The average hourly wage (first half of 1923 in 14 industries of Amsterdam, in Dutch cents) was: skilled, 83, semi-skilled, 70; unskilled, 69. Municipal wages (1923) were: miners (below the surface) 6.43 florins per shift; (above the surface) 4.33 florins per shift; gas workers, 0.76 florin per hour; electrical workers, 0.80 florin per hour; metal workers, 0.62 florin per hour; building workers: masons, 1 09 florins per hour; carpenter, 1.01 florins per hour; assistant mason, 0.92 florin per hour; gun workers, 0.75 florin per hour; munitions and explosive workers, 0.68 florin per hour; construction workers, 0 81 florin per hour. Collective wage agreements numbered 498 for January–November, 1923, against 500 for 1922 Strikes and lockouts were 257 for January–November, 1923, against 308 for 1922. There were 3883 commercial failures for January–November, 1923, against 3403 for 1922. Unemployed workers numbered 102,225 on Dec. 31, 1923, against 106,528 on Dec. 31,1922, principally in the metal and building trades; a total of 110,268 sought unemployment aid on Jan. 26, 1924. The wholesale price index (1913 = 100 for 48 articles) was 151 for 1923, against 160 for 1922 and 182 for 1921. The retail price index (1913 = 100 for 17 articles in six cities) was 145 for 1923, against 157 for 1922 and 179 for 1921.

History. The political history of the Netherlands during the War was the familiar tale of neutral nations: to remain aloof from the struggle by word and deed, to render what aid was possible to the unfortunate victims of the War, to carry on the usual international relations as far as might be, and at the same time to supply the daily wants of the population in spite of the sadly disrupted state of the world, were the concerns of the Dutch in the years 1914–18. The outbreak of the War brought the whole military strength of Holland into the field. By Aug. 4, 1914, 200,000 men were under arms, and as hostilities progressed and the work of policing the coasts and the frontiers increased, more units were called up, so that at its height the Dutch army totaled 400,000 men. The expense, necessarily, was enormous for so small a country. In December, 1914, a loan of $100,000,000 had to be floated to meet the costs of the establishment. In all a debt of more than $750,000,000 was incurred which could be wholly attributed to the War, i.e. for the upkeep of the army and navy, the care of refugees and interned soldiers, etc. The martial character of the country became more striking year by year. In 1915 all workmen engaged in the manufacture of munitions were placed under martial law, and a check was put on their goings and comings; later in the year, the ever-present threat of invasion prompted the government to declare a state of siege in some of the communes of north Holland and also in some parts of Amsterdam. Not until the Armistice did Holland dare relax her vigilance, and then the threat of mutiny among the soldiers hastened demobilization sooner than the government might have wished. The problem of the returning soldiers, in view of the disorganization of industry and the dearth of housing, contributed greatly to the trials of the state. The feeding of the population and the providing of industry with the raw materials necessary for its operation were perhaps Holland's most pressing problems. Normal activity was dependent on keeping the regular channels of trade clear Having become a country of truck farmers and cattle breeders, Holland of necessity depended on Germany for her coal and iron and on France, Great Britain, and the United States for her foodstuffs and textiles. A brisk overseas and land trade was carried on with all these as well as with Switzerland, Italy, and Austria-Hungary. The War curtailed intercourse on land, except with Germany; and the British blockade and the German submarine policy as well as American seizure of Dutch ships in 1918 played havoc with the Dutch merchant marine. More and more, Holland was put at the mercy of belligerents, and only the conclusion of the War checked the progress of the famine gripping her people. Extraordinary administrative measures had to be taken. In 1914 and 1915 the export of cereals and flour, cotton, rice, and linseed was prohibited. In 1915 the Netherlands Overseas Trust was formed for the purpose of handling imports. Before Great Britain and France would give their consent to the maintenance of the usual trade relations, it was necessary for the Trust to give assurances that the articles imported would not be reshipped to Germany. In 1916 the scarcity of flour forced the prohibition of the baking of white bread; maximum prices for cereals were fixed. The dislocation of trade with the Dutch East Indies compelled the government to maintain a strict surveillance over the distribution of foodstuffs and fodder What little prosperity there was grew out of the maintenance of relations with the Central Powers; Germany and Austria took Holland's vegetables and dairy products, and Germany, in turn, sent coal and iron.

In a situation of such complex relations the rise of irritations and misunderstandings was inevitable. Clashes with Germany and the Allies were frequent. During 1915–17, notes were interchanged frequently with Germany over the violation of Dutch neutrality by the landing of airships, the stopping of merchant vessels, and the mining and torpedoing of Dutch ships; in 1918, feeling ran high over the British and American seizure of Dutch ships. And yet, in spite of vexations of this character and personal distress due to the hardships of the War, the Dutch worked unsparingly in the interests of their less fortunate neighbors. The invasion of Belgium sent into Holland some 1,200,000 refugees who were clothed and fed for varying lengths of time. By the end of the War there were still about 30,000 such refugees partaking of the hospitality of the Dutch. Interned soldiers at times numbered as many as 50,000, most of them Belgians, but also many Russian and German deserters. The Dutch Red Cross

did yeoman work in facilitating the exchange of British and German prisoners. In all these humanitarian activities the government must have expended $25,000,000, while private contributions easily reached a similar amount.

These preoccupations did not check civil and political developments of extraordinary importance. By the electoral reform act of Dec. 12, 1917, universal suffrage and proportional representation were established. Sex disabilities of women were likewise removed. In 1917, by a constitutional amendment, the government was ordered to provide for the upkeep of denominational as well as secular schools. As a result of an increasing labor agitation during the War, a series of enactments was promulgated in 1919 which aimed at better social and working conditions. By these laws, the eight-hour day was assured in factories and offices; workmen's insurance was extended to all industries except agriculture and navigation; the general supervision of health activities was turned over to a state health council; a council of labor was erected to advise generally all administrative departments in the conduct of labor affairs. But the inability of affairs to mend, in spite of paternalistic legislation, increased the insurgency of the labor classes. In 1918 and 1919, under the leadership of Troelstra, the Social Democrats pressed for a political revolution, some even demanding the abdication of the Queen. Continued hard times brought on a serious dock strike during February–April, 1920, and such outbreaks were frequent in the subsequent years. The threat of proletarian control forced the union of most of the elements of the Right with the result that a Catholic government was constituted in 1918, for the first time, under Jonkheer Ruys de Beerenbrouck. The elections of 1922 for the second chamber returned 32 Catholics, 20 Social Democrats, 16 Antirevolutionists, and some others, so that the Beerenbrouck ministry continued in power by the support of the Right bloc.

After the War the country was plunged more deeply into the stormy sea of foreign relations. On Nov. 10, 1918, the Dutch were unpleasantly surprised by the presence of the former Kaiser in their midst. His stay at Amerongen was unmolested, and in spite of demands from the Allies for his extradition in 1920, the Dutch government refused to yield him up. All other questions yielded precedence to the demand of Belgium for the revision of the treaties of 1839. Belgium, in effect, desired sovereignty over the western Scheldt as well as the district of southern Limburg on the east. Belgium sought the left bank of the Scheldt for the further development of Antwerp; Limburg (q.v.) was desired for strategic and economic reasons. For the consideration of the question the Supreme Council in 1919 created an international commission, but it circumscribed that body's activities by indicating that it would refuse to countenance any transfer of territory. The disputants were advised to come to an amicable understanding over the matter of waterways. In 1920 an agreement was reached on the administration of the Scheldt, the Antwerp-Meuse-Rhine canal and two other water systems. Further difficulties arose, however, with Belgium's insistence that the disposition of the Weilingen at the entrance to the Scheldt, for the pass controlled the port of Zeebrugge, be also considered. On this no agreement could be reached. There were other international concerns to occupy the attention of the Dutch in this period. In 1920, Holland joined the League of Nations. On Dec. 23, 1920, after heated debate, the Parliament voted to resume relations with the Vatican. These had terminated in 1907. In the same year, although it formally refused to open commercial relations with Russia, the Foreign Office indicated that it would not interfere with business transactions. In 1922, Holland welcomed to The Hague the Permanent Court of International Justice which had been created by the League of Nations. The question of the defense of the Dutch East Indies agitated the people profoundly during 1920–23. In 1921, the Queen's address from the throne included a request for the strengthening of the fleet, and the proposal was backed up by the resolution of the Indian Council. In 1922 the government laid before the second chamber an ambitious programme of naval construction. (See NAVIES OF THE WORLD.) The measure was stubbornly contested in 1922 and 1923. Its opponents showed that it meant an additional cost to Holland of $14,000,000 yearly for 12 years, and to the colonies of $20,800,000 for the same term. Nevertheless it was only after a bitter struggle that profoundly shook the whole kingdom that the naval bill was rejected, Oct. 26, 1923, by a vote of 50 to 49. The Ruys de Beerenbrouck cabinet now resigned. The inability of the three parties of the Right to reach an agreement compelled the Queen, after a three-month suspension of governmental activities, to recall de Beerenbrouck in January, 1924.

NEVADA. Nevada is the sixth State in size (110,690 square miles), and the forty-eighth in population; capital, Carson City. The population decreased from 81,875 in 1910 to 77,407 in 1920, a loss of 5.5 per cent. The white population fell off from 74,276 to 70,699; Indian, from 5240 to 4907; negro, from 513 to 346; native white, from 56,277 to 55,897; foreign-born white, from 17,999 to 14,802. The urban population of the State rose from 13,367 to 15,254, while the rural population decreased from 68,508 to 62,153. The only important city in the State is Reno, with 10,867 inhabitants in 1910, and 12,016 in 1920.

Agriculture. Nevada is, agriculturally, one of the least important States, although its agriculture is second only to its mining, and no other industry approaches it. The population of the State decreased 5.5 per cent in the decade 1910–20, but the number of farms increased 17.6 per cent (from 2689 to 3163). The acreage in farms decreased from 2,714,757 to 2,357,163 in 1920, or 13.2 per cent; and the improved land in farms, from 752,117 to 594,741 acres. The percentage of land used for agricultural purposes was 3.9 in 1910 and 3.4 in 1920. The total value of farm property showed an apparent increase from $60,399,365 to $99,779,606, or 65.2 per cent; the average value per farm, from $22,462 to $31,546, or 40.4 per cent. In interpreting these values and indeed all com-

parative values in the decade 1914–24, the inflation of currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 3163 farms in 1920, 2699 were operated by owners, 168 by managers, and 296 by tenants. The comparative figures for 1910 were 2175, 181, and 333. White farmers in 1920 numbered 2944, compared with 2528 in 1910. In 1920, native white farmers numbered 2060, compared with 1661 in 1910; foreign-born white farmers, 884, compared with 867. Colored farmers in 1920 numbered 219, of whom 208 were Indians; in 1910, 161, of whom 148 were Indians. Farms free from mortgage in 1920 numbered 1599, compared with 1805 in 1910; those under mortgage, 884, compared with 361. The number of dairy cows decreased from 17,084 to 16,482; "beef cows," from 210,546 to 189,960; sheep increased from 824,875 to 880,580. The area under irrigation in 1919 was 561,447 acres; in 1909, 701,833. The estimated production of the chief farm crops in 1923 was as follows: corn, 31,000 bushels; wheat, 507,000; oats, 122,000; barley, 226,000; potatoes, 698,000; and hay, 473,000 tons Comparative figures for 1913 are: corn, 34,000 bushels; wheat, 1,081,000; oats, 473,000; barley, 492,000; potatoes, 1,760,000; and hay, 646,000 tons

Mining. The most important mineral products of the State are silver, gold, gypsum, and copper Silver, which is the most important mineral, showed a considerable decline in the decade 1914–24; in 1914 the production was 15,455,491 fine ounces; 1915, 14,459,840; 1916, 13,837,525; 1917, 11,269,969; 1918, 10,000,599; 1919, 6,863,580; 1920, 7,745,093; 1921, 7,083,782; and 1922, 8,619,587. The value of the gold produced also decreased sharply in the decade; the output in 1914 was valued at $11,481,188; 1916, $8,866,237; 1918, $6,619,937; 1920, $3,566,728; and 1922, $3,297,384. Copper showed an increase in the middle of the decade but declined sharply in the later years; the production in 1914 was 60,986,450 pounds; 1916, 105,116,813; 1918, 116,316,441; 1920, 50,559,763; 1921, 10,961,491, and 1922, 23,133,091 The small output in 1921 was due chiefly to the business depression, which caused a decrease in the demand for copper. The production of gypsum during the decade ranged from 100,000 to 175,000 short tons per year, with a value in excess of $1,000,000. In addition to the minerals mentioned, the State also produces lead, manganiferous ore, and zinc, but in comparatively small quantities. The total value of the mineral products in 1921 was $14,038,071; $25,648,961 in 1920; $24,457,735 in 1919; $51,080,169 in 1918, and $29,984,338 in 1914.

Manufactures. See UNITED STATES, *Manufactures.*

Education. The educational problem of Nevada is made difficult by the State's sparse population and its vast area. In spite of these difficulties, the progress of education in the decade 1914–24 was constant. Efforts were made toward the consolidation of schools and the development of vocational education. The Legislature passed many measures which greatly aided the administration of the educational system. Vocational education is administered by the Director of Vocational Education and Industrial Rehabilitation, who is also supervisor of trade and industrial education. The object in vocational education has been to reach, through a coöperative spirit, as large a number as possible of persons who may be benefited by the various types of instruction offered, in order that the productive industries of the State may be encouraged and the intelligence of those employed in the trades and other industrial pursuits may be increased; and efforts toward these objects have been successful. The cost of education in the State from 1912 to 1920 increased greatly; in 1912 the cost per pupil was $76.38; in 1920, $128.22; allowance is to be made, of course, for the decreased purchasing power of money. A high-school system was developed efficiently. The total enrollment in the schools in 1913 was 13,622; in the elementary schools in 1922 it was 11,518, and in the high schools, 2389. The total maintenance cost in 1922 was $1,381,752; in addition to this there was a permanent investment of more than $400,000 in grounds and buildings, making a total expenditure for elementary and high schools of $1,784,831, or $122.74 per census child in the State. Illiteracy in the State decreased from 6.8 per cent in 1910 to 6.7 per cent in 1920. Among the native white population it increased from 0.3 to 0.5 per cent; among the foreign-born white, from 7 to 8.5; among the negro, it decreased from 6 to 4.7.

Finance. For finance, see STATE FINANCES.

Political and Other Events. In the decade 1914–24, political control in Nevada fluctuated between the Democratic and Republican parties. In 1914 elections were held for governor, Senator, and Representatives to Congress. The Democratic candidate for governor, Emmet D. Boyle, was elected, defeating Gov. Tasker L. Oddie. Senator Newlands was reëlected, while the Republicans elected a Representative to Congress. At this election an amendment providing for woman suffrage was adopted. In 1916 the Democrats had the predominance of strength and elected Key Pittman United States Senator. In the presidential voting of this year, President Wilson received 17,776 votes; Charles E. Hughes, 12,127. In this election, for the first time in the history of the State, women cast votes for President. The Democrats were again successful in 1918, reëlecting Governor Boyle. Senator Newlands died in 1918, and Charles B. Henderson was appointed to fill the office until the election of his successor. The Republicans returned to power in 1920, electing T. L. Oddie, former governor, United States Senator. A woman, Anne Martin, was the Senatorial candidate on an independent ticket, the first woman candidate for this office. In the presidential voting of this year, Warren G. Harding received 15,479 votes; James M. Cox, 9851. In the elections of 1922, there was a political reaction, and the Democrats elected every State official except one. James W. Scrugham, the Democratic candidate for governor, was elected, and Senator Pittman was reëlected to the Senate. The Supreme Court in 1923 declared unconstitutional the prohibition act passed by the Legislature in that year. On July 6, 1923, a fire at Goldfield resulted in the death of one person and a property loss of more than $500,000. At a State Republican convention in May, 1924, the nine delegates of the State were pledged to vote for President Coolidge at the national convention.

Legislation. The most important acts of

the Legislature in the decade 1914–24 are noted below. The Legislature, in February, 1915, passed a so-called "easy divorce bill," restoring the six months' residence requirement which had been abolished by the Legislature of 1913. The Legislature of 1919 provided for a budget and passed measures providing for an eight-hour day on public works. It also passed statutes defining and punishing criminal syndicalism and sabotage. In 1921 the Legislature created town-planning commissions for incorporated cities and towns, declared oil pipe lines to be common carriers, and made provision for the teaching of thrift in the public schools. A bill for capital punishment by lethal gas instead of by hanging or shooting was signed by Governor Boyle on Mar. 28, 1921, and on February 8, 1924, Gee Jon, a Chinese convicted of murder, was executed by this method. In 1923 the Legislature repealed the State prohibition law which had been declared unconstitutional and substituted a measure corresponding to the Volstead Act. It also granted equal rights in the guardianship of children to women, extended the absent voter privilege to persons who because of physical disability expect to be confined to their homes on Election Day, made the possession of drugs illegally obtained a crime, passed a uniform trading act, enacted a modified old age pension law, and created a small claims court.

NEVADA, UNIVERSITY OF. A coeducational State institution at Reno, Nev., founded in 1874. The student enrollment of the university increased from 340 in 1914 to 825 in the year 1923–24, with 134 in the summer session of 1923. During the decade the faculty likewise increased from 50 to 62 members. The library rose from 28,000 bound volumes in 1915 to 38,843 in 1923. An agricultural building was constructed in 1918, an educational building in 1920, and a building to house the Federal Bureau of Mines' Rare and Precious Metals Experiment Station in 1921. Walter E. Clark, Ph.D., LL.D., succeeded Archer Wilmot Hendrick as president in 1917.

NEVIN, ARTHUR FINLEY (1871–). An American composer, born at Edgeworth, Pa. Having received his first musical education from his father, he entered the New England Conservatory in 1891, studying with O. Bendix (piano) and P. Goetschius (theory). From 1893 to 1897 he studied in Berlin with Klindworth, Jedliczka (piano), and Boise and Humperdinck (composition). He then returned to Edgeworth, where he lived until 1910, devoting his time to composition and teaching. In 1903–04 he spent some time with the Blackfeet Indians in Montana, collecting their melodies and legends. There he found the subject for his Indian opera *Poia*, which was produced at the Royal Opera in Berlin (1910), the first work of an American composer ever brought out at that institution. In 1915–20 he was professor of music at the University of Kansas, and in 1921 he became director of municipal music at Memphis, Tenn. He also wrote two other operas, *The Daughter of the Forest* (Chicago, 1918) and *Twilight* (not produced up to 1924); a masque, *A Night in Yaddo-Land;* two cantatas, *Roland* and *The Djinns;* three orchestral suites, *Miniature, Lorna Doone,* and *Love-Dreams; Bakawali Dances* for orchestra; a string quartet and a piano trio; and piano numbers and songs.

NEVINSON, HENRY WOOD (?–). An English newspaper correspondent and writer. He was correspondent for the *Daily Chronicle* in the Greco-Turkish War of 1897, traveled much in Spain, Africa, and elsewhere in the years following, and reported for various newspapers campaigns in Morocco and the Balkans in 1912. He was accredited by the War Office as official correspondent at the Dardanelles for several papers and was wounded during operations there. He was later correspondent with the British armies in Salonica, Egypt, France, and Germany. He was editorial writer for several important papers and wrote much on politics and other subjects. His books include: *The Thirty Days' War* (1898); *Books and Personalities* (1905); *The Dawn in Russia* (1906); *The Dardanelles Campaign* (1918); *Lines of Life* (1920); *Essays in Freedom and Rebellion* (1921); and *Changes and Chances* (1924).

NEW, HARRY STEWART (1858–). A Postmaster General of the United States, born at Indianapolis, Ind., and educated at Butler University. He began as a reporter on the *Indianapolis Journal*, and from 1878 to 1903 he was editor, part owner, and publisher of that newspaper. He served in the Spanish-American War. In 1896 he was elected to the Indiana State Senate for four years, and from 1900 to 1912 he was a member of the Republican National Committee. In 1917 he was elected to the United States Senate and served till 1923, when he was appointed Postmaster General by President Harding.

NEWARK. The largest city in the State of New Jersey. The population rose from 347,469 in 1910 to 414,524 in 1920 and to 438,699 by estimate of the Bureau of the Census for 1923. The 250th anniversary of the city was celebrated during five months of 1916 with an historical pageant, a prolonged music festival and an exhibit of local industries. A memorial building was erected by the city at a cost of $1,500,000 to mark the occasion, and a copy of Verrocchio's equestrian statue of Bartolommeo Colleoni, executed by J. Massey, was given to the city by Christian Feigenspan. The city-planning commission in 1915 offered a comprehensive plan for the city of Newark, and a zoning plan in 1919. The northeast wing of the city hospital was built in 1915; a site for the Newark museum was bought in 1922 and $500,000 given by Louis Bamberger towards the $625,000 necessary for the building. A new two-story city market building covering two acres, with an open paved farmers' market of three acres, was finished in 1923 at a cost of $5,100,000. Port development also proceeded rapidly, especially along the tidal meadows known as Port Newark. Between 1913 and 1924, the city spent $6,000,000 reclaiming, filling and developing a large area of the meadows and constructing a channel 30 feet deep and 400 feet wide. During the War about half the Port was taken over in the interest of the Federal government, which built warehouses for use as army bases at a cost of upwards of $13,000,000. The Submarine Boat Corporation, which received a subsidy from Congress of $17,000,000, built 150 steel merchant vessels during the War from their shipyards on the reclaimed land; two other shipbuilding corporations were established in Kearny. Several streets were built in the district. Eventually, under the plan, 4000 acres of this part of the harbor were

to be filled in and improved, a number of water channels were to be dredged extending into all parts of the new land, piers were to be constructed at least 1200 feet long to accommodate ocean-going vessels, and equipped with adequate railroad tracks, electric traveling cranes, warehouses, etc. In 1922, the Central Railroad of New Jersey was authorized by the War Department to build a bridge across the lower end of Newark Bay to replace the trestle and drawbridge then standing. This permission the city contested in the courts Further appropriations of $2,100,000 for the immediate improvement of Newark Bay and the Passaic and Hackensack Rivers was authorized by Congress in 1922; in 1924, the government had started additional widening of Newark Bay channel and expected to spend nearly $800,000 in that year. Direct boat operation was established between Newark and Pensacola, Fla., Mobile, Ala., Beaumont and Port Arthur, Tex., Los Angeles and San Francisco, Cal., Portland, Ore., and Seattle, Wash. In 1923, new industrial establishments made investments in Newark of approximately $70,000,000. The commission form of government was adopted by the city in 1917.

NEWARK MUSIC FESTIVAL. See MUSIC, *Festivals.*

NEW BEDFORD. The fourth city in Massachusetts in population and third in value of its manufactured products The population increased from 96,652 in 1910 to 121,217 in 1920, nearly 40 per cent in 10 years, and to 130,072 by estimate of the Bureau of the Census for 1923. During the decade 1914–24 a State pier 750 feet long was completed. A modern intercepting sewer system was installed, adequate to care for a population of 300,000. The capital invested in the cotton mills, the leading industry, rose from $47,820,575 in 1914 to more than $175,000,000 in 1924, and the number of persons employed from 31,820 to 36,000 The public library was increased from 150,000 to 160,000 volumes.

NEWBERRY, TRUMAN HANDY (1864–). An American financier and public official, born in Detroit, Mich. He graduated from Yale in 1885 and was later connected in various capacities with railroads and other industrial organizations. In the Spanish-American War he served as lieutenant and navigator. He was appointed Assistant Secretary of the Navy in 1905 and served until 1908, when he assumed the post of Secretary of the Navy until March, 1909. In the War he was commander of the United States Naval Reserves. He was a candidate for the United States Senate in 1918 and in the primaries defeated Henry Ford for the nomination. He was later elected. The expenditure of over $200,000 in the primaries led to accusations of corruption. He was tried and convicted in the State courts, but the case was dismissed in the United States Supreme Court. Charges were brought before the Senate Committee on Privileges and Elections in 1922, and he was exonerated. He resigned his seat following the elections of 1922. See MICHIGAN.

NEW BRUNSWICK. A Canadian maritime province, with an area of 27,985 square miles. In 1911 the population was 351,889; in 1921, 387,876, a gain of 10.23 per cent. The rural population in 1921 was 67.9 per cent of the total; in 1911 it had been 71.7 per cent. Populations of the principal towns in 1921 were: St. John, 47,166 (42,511 in 1911); Moncton, 17,488; Fredericton, the capital, 8114.

Industry and Trade. In 1923 only 909,945 acres were under field crops out of the total area, although agriculture was the most important industry. The increase over 1914 was only slight (904,055 acres in 1914). Total value of yield in 1923, $20,864,300; in 1914, $20,045,100. Oats, hay and clover, and potatoes received the greatest attention. Dairying showed substantial gains, since 1,224,930 pounds of butter were made in 1922, against the 849,633 pounds in 1910. Fishing continued to occupy a high station; in 1922 the catch was valued at $4,688,276, comparing favorably with that of 1913. Mineral production in 1922, largely made up of coal and gypsum, reached $2,263,692, as compared with $1,102,613 in 1913. Much of the forest land was in the hands of the government, and lumbering ranked high among the industries. Lumber cut in 1921 was valued at $7,811,000; pulpwood made a very thriving industry (61,810 tons), worth about $5,244,000. Manufacturing progressed. In 1910 there were 1158 establishments (capital $36,125,012); in 1921, 1326 establishments (capital, $103,367,891). The output in 1910 was $35,422,302; in 1921, $59,514,741. Of the 50,406 horse power estimated available, 47,100 (1923) were already being worked. Exports, domestic and foreign, amounted to $75,924,379 in 1922–23 ($34,634,156 in 1912–13); imports in 1922–23, $27,574,668 ($14,445,811 in 1912–13). In 1922 there were 1947 miles of railway line as compared with 1545 in 1913.

Government. The receipts for 1922 were $3,226,728 ($1,459,000 in 1913), and expenditures $2,985,877 ($1,446,963 in 1913). The debt of the province in 1912 was only $4,693,457; by March, 1922, it had mounted to $25,463,932. The money expended on public works, i.e. hydro-electric development, roads, bridges, and grants to railways, accounted for the increase. By 1922 teachers had increased to 2246 from the 2002 in 1913, and pupils to 71,346 from the 63,580 in 1913. The total cost of education also increased, from $942,203 in 1913 to $2,657,046 in 1922. Of the three universities in the province, Mt. Allison, the largest, was in favor of a federation of the universities of all Maritime Provinces, but the University of New Brunswick stood in the way. The province was represented in the Canadian Parliament by 10 senators and 11 members of the house. The suffrage was exercised by both sexes.

NEW CALEDONIA. See PACIFIC OCEAN ISLANDS.

NEWELL, EDWARD THEODORE (1886–). An American numismatist, born at Kenosha, Wis., and educated at Yale University. From 1907 he was engaged in research in numismatics and kindred subjects. He was a member of numismatic and learned societies and wrote many works on coins and minting, including *The Dated Alexander Coinage of Sidon and Ake* (1916); *Tarsos under Alexander* (1919); *Myriandros* (1920); and *The Kyparissia Hoard* (1921). In 1917–18 he served with the military intelligence division of the United States Army.

NEWFOUNDLAND. A British dominion in North America, comprising the island of Newfoundland and Labrador (q.v.). The area of the island is 42,734 square miles; of Labrador,

120,000. The total population increased from 242,619 in 1911 (Labrador, 3949) to 262,979 in 1921 (Labrador, 3621). St. John's, the capital, had a population of 37,047 in 1921 (32,292 in 1911); Harbor Grace, 3825 (4279); Bonavista, 4025 (3911); Carbonear, 3320 (3540). The population, the great bulk of which was native and of English, Irish, and Scotch descent, still remained practically concentrated on the southeast coast. Emigration rose noticeably during the postwar depression.

Industry and Trade. Fishing continued to exceed all other occupations in importance. During the War it enjoyed exceptional prosperity in consequence of the general food shortage but afterward suffered an equally marked decline. For the falling-off in the cod fishery, a two-season attempt at government control of sales was held partly responsible. In 1922–23, 939 men and 51 vessels on the Banks brought in a catch of 69,372 quintals, compared with 152,374 quintals brought in by 1830 men in 104 vessels in 1913. The serious decline in the seal fishery was partly attributable to the loss of ships and the prohibitive cost of shipbuilding In 1913, 19 steamers with 3609 men brought in 272,065 seals; in 1922–23 it required a government subsidy and removal of all restrictions to induce 8 vessels with 1224 men to carry on the work, and only 101,770 seals were taken in that year. The lobster, herring, and whale fisheries also showed a distinctly downward trend; the lobster had grown scarce because of overfishing; the herring market was affected by renewed European competition; the whale fisheries had practically ceased The prime reason for this serious slump, however, was the depreciation of currencies in the Mediterranean countries which had grown to be the chief markets for the catch. At prevailing rates of exchange, that trade had ceased to be profitable To relieve the serious situation that ensued, the government in 1923 undertook a programme of encouragement for industry and farming, in order to relieve the almost entire economic dependence of the island on its fisheries. Plans were under way in that year to develop the water-power resources at Grand Lake on the west coast, at a cost of $18,000,000, part of which was to be advanced by the British government. This project was expected to supply power for a large pulp and paper mill, to hasten the development of mineral resources, and possibly to lead to the smelting of iron. Incidentally the preliminary work was reducing unemployment. The industries growing out of the great forest resources had already extended considerably. Spruce had replaced the disappearing pine as the important wood. Pulp and paper mills in 1920 exported 19,864 tons of pulp ($334,276) and 80,719 tons of paper ($4,725,660). The mineral production, chiefly iron, in 1912 amounted to $2,810,000; in 1920–21, 607,982 tons of iron, valued at $672,061, were exported. Some copper and oil had been produced. The mineral resources were as yet unexplored, although in 1921 a beginning was made at the development of certain coal deposits and the investigation of oil-bearing lands. Of the 4,000,000 acres capable of cultivation, up to 1923 only 220,000 were being utilized, and the government was actively encouraging the population away from the sea to the land. The chief crops were hay, potatoes, cabbage, turnips, and oats. The total value of farm crops in 1912 was $2,000,000; in 1921, $14,367,877. Exports, which in 1913–14 were valued at $14,720,000, had risen by 1918–19 to $36,784,616 but fell sharply in two years to $19,478,417 in 1921–22 ($20,956,863 in 1922–23). Imports fluctuated likewise: $14,793,000 in 1913–14; $40,533,388 in 1919–20; $18,309,853 in 1921–22; $19,321,824 in 1922–23. The export trade with Canada gained considerably in importance in 1922–23, but the chief markets were still the United Kingdom, Portugal, Spain, and the United States. The bulk of the imports came from Canada and the United States, the former achieving first place as a source during this period. Dry codfish remained the principal export, with manufactured paper in second place. Other important items in 1922–23 were iron ores, cod oil, herring, pulp and sulphide, lobsters, sealskins, and seal oil. The total value of fishery exports in that year was $12,374,109 ($14,448,736 in 1921–22). The total revenue of the dominion, in bulk from customs, was $3,142,491, and the expenditure $3,524,653, in 1911–12. From 1917 to 1921, there was a decided surplus in the treasury in spite of extraordinarily generous appropriations In 1921–22, however, the revenue had shrunk to $8,269,680, with an expenditure of $9,127,542, but from that year the situation began to mend. The increase of the funded public debt from $29,470,060 in 1912–13 to $55,030,027 in 1921–22 was largely due to war expenditure ($60 per capita). In 1922–23, the revenue was $8,876,772, expenditure, $9,552,301; funded debt, $54,957,765. In 1919 there were 904 miles of government railroad, as compared with 794 in 1913 Additional proposed extensions had been postponed during the War, after which, because of unprofitable operation, the management of the roads and their extension became a conspicuous problem of the government. There was an additional 47 miles of private line. The mileage of telegraph wires (open) increased from 4225 in 1914 to 4600 in 1922; telephone wires, from 899 in 1913 to 965 in 1922. Steamship communications with the United Kingdom, Canada, and the United States were disorganized during the War, but were being steadily restored. Public instruction still remained under denominational auspices, with government support, and school attendance had not been made compulsory by law.

History. A Newfoundland regiment was enlisted on the outbreak of the War, and saw service in Gallipoli, Egypt, France, and Flanders. In all, some 6500 men were under arms. In 1913, Sir Edward Morris's party was returned to office and continued in power through 1917, when the Morris government was succeeded by a ministry headed by Sir William Lloyd. In 1919, Sir Michael Cashin became premier; in November, 1919, as a result of the general election, Mr. Richard Squires succeeded to office. The Squires government, however, resigned in 1923, though the general election of May had returned it with a sizable majority. Mr. W. R. Warren was then summoned by the governor. On Dec. 26, 1923, Premier Warren brought a grave accusation against his predecessor, Sir Richard A. Squires, charging him, among other things, with the receipt of money from private corporations and diversion of government funds to individuals occupying high official posts. An investigator for the British Colonial Office found the

charges in a large measure true; this was followed by the arrest of Squires in April and the overthrow of the Warren government. Reorganization of the public services and a greater honesty in government became the leading issues of the day. Mr. Hickman, who succeeded Mr. Warren, enjoyed only a brief tenure of office, for his party was turned out in the general election of June 3. He was in turn followed by Mr. Walter Warren who proceeded to investigate his predecessor's government.

NEW GUINEA. One of the largest islands of the world, in the East India Archipelago. Area, 320,000 square miles (estimated). Politically it was divided into: (1) Dutch New Guinea, area, 160,692 square miles; population (1920) 195,460; (2) Territory of Papua (British New Guinea), area, 90,540 square miles; population 276,888 (1922); (3) Territory of New Guinea (late Kaiser Wilhelm's Land), area, 70,000 square miles; population (estimated), 100,000. This was for the mainland only.

Dutch New Guinea was administered from the Dutch East Indies (q.v.), of which, for trade and other purposes, it was considered an integral part.

The Territory of Papua was a possession of the Australian Commonwealth. Little of the area was under cultivation; the natives are averse to hard labor. In all, only 219,181 acres had been leased by planters (1922), and coconuts, rubber, and sisal hemp were the chief products. Gold continued to be mined to some extent, and boring for oil began after 1915. The gold output declined from £64,115 in 1912–13 to £60,091 in 1921–22 Imports and exports for 1913-14 were £212,134 and £123,140; for 1921, £484,770 and £172,672. Revenues and expenditures for 1913–14 were £54,703 and £81,095; in 1921–22, £73,288 and £124,912. To meet the deficit, Australia supplied an annual grant of £50,000. The Australian government showed itself zealous in the preservation of the integrity of the natives and refused to settle cheap coolie labor in the territory. In 1922 Europeans numbered 1104. Port Moresby was the chief town and port of call for Australian ships.

The Territory of New Guinea was the name given to the former German New Guinea and included besides the late Kaiser Wilhelm's Land (area 70,000 square miles; population, 100,000), the Bismarck Archipelago (area 17,600 square miles; population, 188,000), made up of New Britain, New Ireland, and other islands, and Bougainville and Buka of the Solomon Islands group (area 3400 square miles; population, 17,000). On Sept. 12, 1914, an Australian force occupied the islands. A mandate was given to Australia for the territory by the League of Nations on Dec. 17, 1920; the Australian government established its civil administration on May 9, 1921. The seat of government was at Rabaul on New Britain, the former German capital. In 1921, nonindigenous inhabitants numbered 3173, divided as follows: 715 British, 1402 Chinese, 215 Dutch, 579 Germans, 87 Japanese, and 60 Americans. On the mainland coconuts were cultivated as well as rubber and cocoa; tropical fruits served as the articles of food. Total revenues for 1918–19 and 1921–22 were £55,760 and £91,644. Exports for the same years were £269,666 and £499,197; imports, £271,861 and £468,711. Leading exports were copra, shell, cocoa, and birds of paradise. Imports included groceries, hardware, tobacco, spirits, and oils. See also ETHNOGRAPHY.

NEW HAMPSHIRE. New Hampshire is the forty-third State in size (9341 square miles), and the forty-first in population; capital, Concord. The population increased from 430,572 in 1910 to 443,083 in 1920, a gain of 2.9 per cent. The white population increased from 429,906 to 442,331; negro, from 564 to 621; native white, from 333,348 to 351,098. The number of foreign-born white fell from 96,558 to 91,233. The urban population of the State mounted from 255,099 to 279,761, while the rural decreased from 175,473 to 163,322. There are only two important cities, Manchester and Nashua. The former increased from 70,063 in 1910 to 78,384 in 1920; the latter from 26,005 to 28,379.

Agriculture. While the population of the State increased 2.9 per cent in the decade 1910–20, the number of farms decreased 24.1 per cent (from 27,053 to 20,523); the land area in farms, from 3,249,458 acres to 2,603,806, or 19.9 per cent; the improved land in farms, from 929,185 acres to 702,902. The total percentage of land used for agricultural purposes decreased from 56.2 in 1910 to 45 in 1920; the percentage of improved farm land, from 28.6 to 27. The total value of farm property showed an apparent increase from $103,704,196 to $118,656,115, or 14.4 per cent; the average value per farm, from $3833 to $5782, or 50.8 per cent. In interpreting these values and indeed all comparative values in the decade 1914–24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 20,523 farms in 1920, 18,604 were operated by owners, 546 by managers, and 1373 by tenants. The comparative figures for 1910 were 24,493, 681, and 1879. White farmers numbered, in 1920, 20,509, of whom 17,890 were native and 2619 foreign-born. In 1910 the white farmers numbered 27,038 (native-born, 24,347; foreign-born, 2691). Farms free from mortgage in 1920 numbered 11,992, compared with 18,119 in 1910; those under mortgage numbered 5389, compared with 6234. The number of dairy cows increased from 101,278 in 1910 to 119,203 in 1920, indicating a decided trend toward the dairy industry. "Beef cows," however, decreased from 16,175 to 5055, and sheep decreased from 31,201 to 28,021. The estimated production of the principal farm crops in 1923 was as follows: corn, 978,000 bushels; oats, 598,000; potatoes, 1,735,000; hay, 494,000 tons; and apples, 191,000 bushels. Comparative figures for 1913 are: corn, 814,000 bushels; oats, 420,000, potatoes, 2,074,000; hay, 495,000 tons.

Manufactures. New Hampshire is an important industrial State in point of value of products. There were, in 1920, 8 cities of 10,000 inhabitants or more, the combined population of which formed 43.7 per cent of the total for the State; in 1919 they reported 63.3 per cent of the value of the State's manufactured products. There were in the State, in 1909, 1961 manufacturing establishments; in 1914, 1736, and in 1919, 1499. Persons engaged in manufacture numbered 84,191, 85,013, and 90,332; while the capital invested amounted to

$139,989,662, $156,748,853, and $329,166,870 in those years. The value of the products, in 1909, was $164,581,019; in 1914, $182,843,863; and in 1919, $407,204,934. The increase in value of products from 1914 to 1919 was in great measure due to changes in industrial conditions brought about by the War. The first industry in point of value of products is the manufacture of boots and shoes, amounting to $39,440,000 in 1909; $46,695,000 in 1914, and $92,259,000 in 1919 The second in this respect is the manufacture of cotton goods, which had a value of $33,602,000 in 1909; $35,793,000 in 1914; and $86,392,000 in 1919. Manufactures of woolen and worsted goods, in third place, were valued, in 1909, at $16,731,000; 1914, $15,039,000; and 1919, $45,944,000. The paper and wood pulp industry, next in order, had an output valued at $13,994,000 in 1919; $17,708,000 in 1914; and $41,826,000 in 1919 The most important manufacturing cities are Manchester and Nashua. In Manchester there were, in 1909, 175 manufacturing establishments, with a product valued at $46,812,000; 1914, 151 with $50,800,000; 1919, 165 with $117,493,000 Nashua had, in 1909, 104 manufacturing establishments, with a product valued at $17,326,000; in 1914, 87 with $22,780,000; and in 1919, 92 with $48,985,000. Other important manufacturing cities are Concord, Dover, Keene, Berlin, Laconia, and Portsmouth.

Education. The development of its educational system has always been one of the chief concerns of the people of New Hampshire. As in the case of the other New England States, the decrease in rural population has proved a difficult problem. In 1919 large sections of New Hampshire had become so impoverished and so depopulated that under the existing school laws reasonable elementary education could not possibly be provided for a very large number of children. Because of this, the Legislature, after a careful study, reorganized the school system and for the first time in the history of the State wrote the school laws into a consistent code, in 1921. The results of this action were immediate. The principles of Americanization, equalization, and supervision were adopted. More specifically, the Board of Education was reorganized, methods of consolidation were provided, and, especially, provision was made for education in sparsely populated districts. The Legislature of 1923 passed several important measures which amplified and revised measures already enacted For one, the provisions of the Smith-Hughes Act of 1917 for the promotion of vocational education were accepted, and the State Board of Education was authorized to arrange with institutions, and with the school boards of towns or city districts in the State, to furnish the necessary buildings and equipment for carrying out the provisions of the Federal Act In 1914 the enrollment in the public schools was 63,004; in 1922, 75,683. In the latter year, in the elementary schools, 58,475 were enrolled; in the kindergartens, 1825; and in the high schools, 10,322 The total expenditure for public education in 1923 was $5,718,609. The percentage of illiteracy in the State decreased from 5.5 in 1910 to 5.4 in 1920; among the native white population, from 0.9 to 0.6; among the negro, from 13.8 to 7.7. In the foreign-born population it increased from 15.4 to 16.4.

Finance. For finance, see STATE FINANCES.

Political and Other Events. In the decade 1914–24, New Hampshire remained consistently Republican, with the exception of one year, when the Democrats succeeded in electing their candidate for governor. In 1914 elections were held for governor, United States Senator, and Representative in Congress. Rollin H. Spalding was reëlected Governor, and J. H. Gallinger was reelected to the Senate. The Republicans elected two Representatives to Congress. In the elections of 1916 the Republicans elected their candidate for governor, Henry W. Keyes, and carried other State offices, although at a reduced margin In the presidential voting of this year, President Wilson obtained 43,871 votes, Charles E Hughes, 43,725. At this election the people voted to call a constitutional convention. In January, 1916, the United States government purchased, under the Weeks Forestry Land Act, a tract of 55,000 acres to be added to the forest reserves of the State. Senator Gallinger died during the primary election campaign of 1918, and the term of Henry F. Hollis, Democrat, expired in 1918. It was thus necessary to elect two Senators in this year. Gov. Henry W Keyes was elected for the regular term, and George H. Moses was chosen successor to Senator Gallinger. In the State election, John H. Bartlett, Republican, was elected governor, together with a Republican Legislature. The constitutional convention met in June, 1918, but adjourned following its organization. It met twice subsequently, but none of the amendments it submitted to the people was ratified. Elections were held in 1920 for United States Senator and for governor and other State officers. The Republicans elected their candidate for governor, Albert O Brown, and reelected Senator Moses to the Senate. In the presidential election of this year, W. G. Harding received 94,947 votes; James M. Cox, 62,562 In 1922 the Democrats succeeded to power in the State and elected their candidate for governor, Fred H. Brown, and a Representative to Congress. They also elected a majority of 10 in the Legislature, although the Republicans continued to control the Senate. F. H. Brown was inaugurated in January, 1923. In his inaugural message he favored a law establishing a 48-hour week for women and children in the manufacturing industries, an amendment of the tax laws, and a tax of $.01 a gallon on gasoline.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. The Legislature of 1917 amended the laws relating to the conduct of trials and made provision for the calling of a constitutional convention in June, 1918. The governor was given authority to suspend the labor laws by the request of the Council of National Defense. A "blue sky" law was enacted, and the laws relating to banking and education were amended. The Legislature of 1919 ratified the Federal prohibition amendment on January 16 of that year and the woman suffrage amendment on September 9. The Legislature of 1921 regulated the practice of chiropractors; provided further safeguards against forest fires; made provisions for the protection of maternity and infancy; and regulated and limited the investments of savings banks. In 1923 the Legislature made provision for another constitutional convention; passed a uniform sales act, lev-

ied a gasoline tax, and laid a tax on income from intangibles

NEW HAMPSHIRE, UNIVERSITY OF. A coeducational State institution at Durham, N. H., founded as the New Hampshire College of Agriculture and the Mechanic Arts in 1866 and incorporated as the University of New Hampshire, July 1, 1923 The university more than tripled in size during the decade between 1913–14 and 1923–24, with 300 students enrolled and 46 members of the faculty in the former year as compared with 1123 students and 99 members of the faculty in the latter The library was increased from 35,000 to 47,800 volumes. Two men's dormitories, a women's dormitory, and a commons building were added to the physical plant. Ralph Dorn Hetzel, A.B., LL.B., LL.D., succeeded Edward Thomson Fairchild, A.M., LL.D, as president in 1917.

NEW HAVEN. The largest city of Connecticut and the fourth largest city of New England; a manufacturing and educational centre. The population rose from 133,605 in 1910 to 162,537 in 1920 and to 172,967 by estimate of the Bureau of the Census for 1923 A new railroad station was built, as well as a number of new buildings at Yale University, and a commercial high school and two junior high schools; and there was a wide extension of manufacturing and office facilities. More than 500 acres were added to the city park system, including shore frontage for a municipal bath beach

NEW HEBRIDES. See PACIFIC OCEAN ISLANDS.

NEW JERSEY. New Jersey is the forty-fifth State in size (8224 square miles), and the tenth in population; capital, Trenton. The population increased from 2,537,167 in 1910 to 3,155,900 in 1920, a gain of 24.4 per cent. The white population increased from 2,445,894 to 3,037,087; Negro, from 89,760 to 117,132; native white, from 1,787,706 to 2,298,474; and foreign-born white, from 658,188 to 738,613. Both urban and rural populations increased during the decade; the former from 1,907,210 to 2,474,936; the latter, from 629,957 to 680,964 The growth of the principal cities was as follows Newark (q.v.), 347,469 (1910), to 414,524 (1920); Jersey City (q.v.), 267,779 to 298,103; Paterson (q.v.), 125,600 to 135,875; Trenton (q.v.), 96,815 to 119,289, Camden (q.v.), 94,538 to 116,309.

Agriculture. In common with most of the eastern States, the development of agriculture in the decade 1910–20 did not keep pace with the growth in population. This is shown by the fact that while the population increased during the decade 24.4 per cent, the number of farms decreased 11.3 per cent (from 33,487 in 1910 to 29,702 in 1920); the rural population decreased from 29.4 per cent in 1900 to 24.8 per cent in 1910 and 21.3 per cent in 1920. The acreage of land in farms decreased 11.3 per cent, or from 2,573,857 acres to 2,282,585; while the improved land in farms showed an even greater decrease, from 1,803,336 to 1,555,607 acres, or 13.7 per cent The percentage of the total land area in farms decreased from 53.5 per cent in 1910 to 47.5 per cent in 1920, while the percentage of improved land in farms decreased from 37.5 to 32.3. The total value of farm property in the State showed an apparent increase of 22.4 per cent, or from $254,832,665 to $311,847,948; the average value per farm, from $7610 to $10,499. In interpreting these values, however, and, indeed, all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the 29,702 farms in 1920, 21,889 were operated by owners, 987 by managers and 6826 by tenants. The corresponding figures for 1910 were 24,133, 1060 and 8294. White farmers in 1920 numbered 29,167 and colored farmers, 535. In 1910, the white farmers numbered 33,011 and colored farmers, 476. Farms free from mortgage in 1920 were 10,000; those under mortgage, 10,085. In 1910, the unmortgaged farms numbered 11,983; those under mortgage, 11,793. The total number of cattle in 1920 was 179,459, in 1910, 222,999. Dairy cattle numbered 172,693 and 154,418, in those years. Sheep in 1920 numbered 10,471, compared with 30,683 in 1910; hogs, 139,222 as compared with 147,005 The estimated production of the chief farm products in 1923 was as follows: corn, 9,416,000 bushels; wheat, 1,480,000 bushels; oats, 1,588,000 bushels; rye, 1,157,000 bushels; potatoes, 6,360,000 bushels; sweet potatoes, 2,323,000 bushels, hay, 313,000 tons; and peaches, 2,380,000 bushels. Comparative figures for 1913 are: corn, 10,862,000 bushels; wheat, 1,408,000; oats, 2,030,000; rye, 1,260,000; potatoes, 8,930,000; and hay, 469,000 tons.

Mining. New Jersey is one of the most important mineral-producing States in the eastern part of the country, and it is the only far eastern State that produces zinc. Although it has a considerable diversity of mineral products, the most important are clay products and zinc. The values of the clay products have been $16,484,652 (1914); $20,814,402 (1916); $20,741,244 (1918); $40,021,028 (1920); $27,214,685 (1921). Zinc production was 74,253 short tons (1914); 112,020 short tons (1916); 98,470 (1918); 77,371 (1920); 56,447 (1921) Cement is also one of the most important mineral products, shipments were 3,530,476 barrels valued at $3,081,205 (1914); 2,397,069 barrels, $2,962,592 (1917); 2,563,453, $5,096,558 (1920); 2,840,699, $4,820,538 (1921) In addition to the minerals mentioned, the State produces a small quantity of iron ore and large quantities of sand, gravel and stone. The total value of the minerals in 1921 was $47,429,290, compared with $72,335,207 in 1920; $56,898,033 in 1919; $49,510,290 in 1918; and $31,756,503 in 1914.

Manufactures. New Jersey is one of the leading industrial States. In 1920, there were 39 cities having a population of more than 10,000. These contained 65.6 per cent of the total population of the State, and in 1919 reported 76.4 per cent of the State's manufactured products There were in the State 8817 manufacturing establishments in 1909; 9742 in 1914; and 11,057 in 1919. Persons engaged in manufacture numbered 371,265, 431,003, and 602,170; and the capital invested amounted to $977,172,141, $1,352,381,873, and $2,815,577,127, in those years The total value of the products was $1,145,529,076 in 1909; $1,406,633,414 in 1914; and $3,672,064,987 in 1919. The large increase in value of products during 1914–19 was due largely to the change in in-

dustrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period; but the increase in number of wage earners and in number of establishments indicates clearly a decided growth in the manufacturing activities of the State. The most important industry in point of value of product is the refining of petroleum, valued in 1914 at $90,877,000; and in 1919, at $280,995,000. The smelting and refining of copper ranks second in this respect: in 1909, $125,651,000; in 1914, $159,199,000; and in 1919, $244,269,000. Shipbuilding, in third place, had a product valued at $8,841,000 in 1909; $11,861,000 in 1914; and $238,015,000 in 1919; the extraordinary increase from 1914 to 1919 being due to the conditions resulting from the War. The three-year period from 1916 to 1919 shows an abnormal increase in vessels and gross tonnage launched, which renders comparison of little value. Silk goods, next in order, were valued in 1909 at $65,540,000; in 1914, $75,706,000, and in 1919, $215,051,000. The most important manufacturing cities are Newark, Jersey City, Paterson and Trenton. In Newark there were 1857 manufacturing establishments in 1909, with a product valued at $201,888,000; 2275 in 1914, with $210,601,000; and 2155 in 1919, with $577,609,000. In Paterson, there were 702 in 1909, with $69,263,000; 735 in 1914, with $78,429,000; 1044 in 1919, with $216,659,000. Jersey City had 745 manufacturing establishments in 1909, with a product valued at $128,775,000; 770 in 1914, with $164,529,000; 896 in 1919, with $374,183,000. Similar figures for Trenton were 340 manufacturing establishments, with a product valued at $49,115,000; 304 with $54,822,000; 389 with $122,478,000. Other important manufacturing cities are Camden, Bayonne, Hoboken and Passaic.

Education. In the decade 1914–24, important progress was made in educational matters in New Jersey. Much important legislation was passed, especially in the latter part of the period. In 1919, there was established by law a new teachers' pension annuity system to supersede the old teachers' retirement fund. The new system operates on an actuarial basis: contributions from salaries of teachers are matched by the State, and this provides a pension of approximately half pay. A compulsory physical education law also was passed in 1919; and a continuation school law, requiring children from 14 to 16 years of age to attend continuation classes six hours a week after working papers have been obtained. In 1922, provision was made for special aid by the State to school districts not able of themselves to provide satisfactory schools. The complete survey of finances and business procedure of school districts made in 1921–22 resulted in improved methods in the handling of public moneys. A new normal school was opened at Glassborough in 1923, and in the same year plans were started for a new normal school in Jersey City. Between 1913 and 1923, the enrollment in the public schools increased from 501,948 to 646,046, and the number of teachers increased from 14,811 to 18,273. In the same period the cost of education more than doubled, the cost per pupil, based on average daily attendance, being $91.77 in 1923 as contrasted with $43.72 in 1913. The chief item in this greatly increased cost was the much higher salaries for teachers. The percentage of illiteracy in the State decreased from 6.7 in 1910 to 6.6 in 1920: among the native white population, from 1.4 to 0.9 per cent; among the Negro, from 11.9 to 7.5. The foreign-born white population increased from 14.8 to 16.3 per cent

Finance. For finances, see STATE FINANCES.

Political and Other Events. The control in New Jersey in the decade 1914–24 was divided between the Republican and Democratic parties, with the preponderance of power with the former. In 1914 the Republicans elected a majority in both branches of the Legislature for the first time since 1911. They also elected eight Representatives in Congress, and the Democrats, four. In 1915, at a special election on October 19, an amendment extending the suffrage to women was defeated. In elections held in November of this year, for members of the State Senate and the House, the Republicans increased their majorities in both branches of the Legislature. In 1916 elections were held for governor and for United States Senator. Walter E. Edge, Republican, was elected governor, and Joseph S. Frelinghuysen was elected to the Senate In the presidential voting of this year, Charles E. Hughes received 268,982 votes; President Wilson, 211,018. The voters of Newark, on Aug. 9, 1917, adopted a commission form of government. In 1919 the Democrats elected their candidate for governor, Edward I. Edwards, but the Republicans held the Legislature. In 1920 the presidential voting gave Warren G. Harding 611,541 votes; James M. Cox, 256,887. In 1922 the Democrats were successful in electing George S. Silzer, governor; E. I. Edwards, United States Senator; and six Representatives in Congress. The Republicans held both houses of the Legislature. The chief issue of the campaign was prohibition. The Democratic candidates for governor and Senator openly opposed the State prohibition enforcement act and the Volstead Act. On Feb. 2, 1922, the State court of Errors and Appeals held the State prohibition enforcement law constitutional but "unworkable," and a new act was passed by the Republican Legislature. Governor Silzer, elected in 1922, was inaugurated governor on Jan. 16, 1923. A contest lasting eight weeks between the Governor and the Legislature over the appointment of a new highway commission ended with the confirmation of the Governor's nominations. The commission is headed by Gen. Hugh L. Scott.

Legislation. The Legislature in New Jersey meets annually. The most important acts in the decade 1914–24 are noted below. In 1914 the Legislature passed a home rule act affording cities under a commission form of government greater latitude in the administration of local affairs. In 1914 the Legislature passed a concurrent resolution extending the suffrage to women. As the amendment resolution had already passed the preceding Legislature, it was submitted to the people, as noted above, on October 19, and was defeated. The Legislature of 1917 amended the health laws of the State in important details. In 1918 the Legislature passed a local option bill and a supplement to the corrupt practices act and amended the child labor and other laws. A workmen's compensation bureau was created, as well as a department of charities and corrections with supervisory capacity over certain State institutions.

The Legislature also created an Inter-State Bridge and Tunnel Commission, a Board of Fisheries and a Boxing Commission. Several measures relating to the war emergency were passed at this session. In 1919 the laws relating to the State charitable, penal, and reformatory institutions were revised. Provision was made for the appointment of a commission to investigate the tax laws. This Legislature also passed a measure permitting a jury, as a part of its verdict, to recommend life imprisonment, in which case the death penalty shall not be imposed. The Legislature also enacted a child labor law and passed measures forbidding the display of the red flag or any other symbol or emblem calculated to excite hostility or violence against the government The Legislature rejected the Federal prohibition amendment on Mar 18, 1919. In 1920 the Legislature passed a measure permitting the manufacture and sale in the State of liquor containing 3 5 per cent alcohol. Provision was made for a retirement pension for police and firemen. A bond issue of $28,000,000 for the share of New Jersey in the Delaware Bridge between Camden and Philadelphia, and the Hudson River vehicular tunnel between Jersey City and New York, was authorized In 1921 the Assembly ratified the prohibition amendment, but it was defeated by the Senate The 3 5 per cent alcohol act was repealed. The Legislature created in 1921 a Department of State Police This bill was vetoed by Governor Edwards, but was passed over his veto. In 1922 the Legislature passed measures appropriating $100,000 for the development of the port of New York, under a joint board of members from New York and New Jersey The Legislature on Mar. 9, 1922, finally ratified the Eighteenth Amendment and passed laws for prohibition enforcement over the Governor's veto It also authorized a bond issue of $40,000,000 for the construction of good roads. In 1923 the Legislature passed a measure extending the payment of a soldiers' bonus to 1924, prohibited night work for women in factories after Dec 31, 1924, authorized cities to adopt the city-manager form of government, and passed an act to prevent mob violence.

NEW JERUSALEM, CHURCH OF THE. This organization, commonly known as the New Church, which considers itself the organ of a new spiritual dispensation and not a denomination of the historic Christian church, teaches that the true doctrines of Christianity and the spiritual meaning of the Scriptures were revealed in the writings of Emanuel Swedenborg The first society was established in 1787 in London and the first local organization in the United States in 1792. The General Convention of the New Jerusalem in the United States of America was founded in 1817. Owing to the adoption of a stricter method of counting, involving also the omission of Canadian members, the General Convention declined in number of societies from 96 in 1914 to 86 in 1924 and in membership from 6423 to 5959. Home missionary work was carried on during this period in the United States and Canada, and foreign missions in Denmark, France, Germany, Switzerland, Latvia, Czecho-Slovakia, Austria, Sweden, Japan, and British Guiana; and by the General Church and the British Conference also in South Africa and India. A missionary was sent to the Philippines in 1921, and the first church established there. In the same year the federation of French-speaking New Church people was formed, and in August, 1924, a federation of German-speaking New Church people was organized. The various branches of the New Church, both British and American, in 1922 brought to completion the photofacsimile reproduction of Swedenborg's theological manuscripts (18 thick folio volumes, supplementing 10 others previously published) and the 100 sets were apportioned to church depositaries and large public and university libraries.

NEWMAN, HORATIO HACKETT (1875–). An American zoölogist, born near Seale, Ala., and educated at McMaster University and the University of Chicago. He was instructor in zoölogy at the University of Michigan (1905–08); professor at the University of Texas (1908–11), and associate professor (1911–17), professor (1917–), and dean of the colleges of science (1915–), at the University of Chicago He published *The Biology of Twins* (1917), *Vertebrate Zoölogy* (1919), and *Readings in Evolution, Genetics and Heredity* (1921).

NEW MEXICO. New Mexico is the fourth State in size (122,634 square miles), and the forty-third in population; capital, Santa Fé. The population increased from 327,301 in 1910 to 360,350 in 1920, a gain of 10.1 per cent. The white population increased from 304,594 to 334,673. Negro, from 1628 to 5733; native white, from 281,940 to 305,596, and the foreign-born white, from 22,654 to 29,077 The number of Indians in 1920 was 19,512, compared with 20,573 in 1910. The urban population of the State rose during the decade from 46,571 to 64,960, the rural, from 280,730 to 295,390. The only large city in the State is Albuquerque, which increased from 11,020 in 1910 to 15,157 in 1920.

Agriculture. While the population of the State increased 10.1 per cent in the decade 1910–20, the number of farms decreased 16 3 per cent (from 35,676 to 29,844). The acreage in farms, however, showed a decided increase from 11,270,021 to 24,409,638, or 116 6 per cent; and the acreage of improved land in farms increased from 1,467,191 to 1,717,224. The total percentage of the total area used for agricultural purposes increased from 14 4 in 1910 to 31.1 in 1920; but the percentage of farm land improved decreased from 13 to 7 per cent The total value of farm property showed an apparent increase from $159,447,990 up to $325,185,599, or 103 9 per cent, the average value per farm from $4469 to $10,896 In interpreting these values, and, indeed, all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 210 in 1920. Of the 29,844 farms in 1920, 25,756 were operated by owners, 433 by managers, and 3655 by tenants The comparative figures for 1920 were 33,398, 321, and 1957 White farmers in 1920 numbered 27,969, of whom 26,593 were native Of the 1875 colored farmers, 1833 were Indians. White farmers in 1910 numbered 33,528; native white farmers, 32,088; and colored farmers, 2148. Farms free from mortgage in 1920 numbered 16,650, compared with 31,382 in 1910; those under mortgage numbered 6257, compared with 1775. The number of dairy cows decreased

from 51,451 in 1910 to 45,827 in 1920; "beef cows" increased from 579,601 to 797,077; both increase and decrease being due partly to change in classification employed in these years. Sheep decreased from 2,894,984 in 1910 to 1,640,475 in 1920; hogs increased from 45,409 to 87,906. The area under irrigation increased from 461,718 acres in 1909 to 538,377 acres in 1919. The estimated production of the principal farm crops in 1923 was as follows: corn, 3,429,000 bushels; spring wheat, 1,323,000 bushels; winter wheat, 446,000 bushels; oats, 1,735,000 bushels; barley, 258,000 bushels; potatoes, 336,000 bushels, and hay, 358,000 tons Comparative figures for 1913 are: corn, 1,572,000 bushels; wheat, 1,221,000; oats, 1,500,000; barley, 96,000; potatoes, 612,000; and hay, 399,000 tons.

Mining. New Mexico is rich in mineral resources which have not yet been fully developed, principal among them, in order of importance, being coal, copper, silver and clay products. The progress of the mineral industry during the decade 1914–24 is indicated by a comparison of production figures for the principal minerals The coal production was 3,877,689 net tons, valued at $6,230,871 in 1914; 3,817,940 tons, $5,481,361 (1915), 3,793,011, $5,580,369 (1916); 4,000,527, $7,455,166 (1917), 4,023,239, $10,787,082 (1918), 3,683,440, $13,568,000 (1920), 2,453,482, $9,585,000 (1921). The increased value in 1920 and 1921 was due chiefly to the inflation of the currency and a corresponding decline in the purchasing power of money. The output of gold, copper, silver, lead and zinc for several years during the decade was as shown in the table The decrease in production in 1921 was due largely to the depression in business conditions which affected metal mining. In addition to the minerals mentioned, the State produces iron ore, sand and gravel, and stone. The total value of the mineral production in 1921 was $13,227,268, compared with $27,883,565 in 1920, $22,679,960 in 1919, $40,631,024 in 1918, and $18,072,919 in 1914

OUTPUT OF MINERALS IN NEW MEXICO

Year	Copper Pounds	Gold Dollars	Silver Fine ounces	Lead Pounds	Zinc Pounds
1914	59,307,925	$1,171,696	1,777,445	1,763,641	18,403,392
1916	92,747,289	1,382,480	1,766,274	8,214,189	36,570 649
1918	98,264,563	682,791	782,421	8,398,239	24,050,324
1920	54,400,691	480,302	768,042	2,869,525	10,013 580
1921	14 267 338	196 822	571,899	678,601	228,000
1922	31 937 207	412,693	752,240	3,012,223	4,496,806

Manufactures. See UNITED STATES, *Manufactures.*

Education. There was steady development in education in New Mexico during the decade 1914–24. The elementary schools undertook to furnish education not only in the essential branches, but also in vocational training, including agriculture, domestic science, and manual training The secondary schools during the 10 years of Statehood showed a remarkable increase in their development, the number having practically doubled and the ratio of attendance grown proportionately. In addition to these educational activities, the State provided for the education of the blind and the deaf and dumb. The county unit for administration purposes was developed in 1913 and supplemented by the county unit law of 1915 for purposes of taxation In 1921, the Legislature made provision for an educational auditor, whose duty it was to assist the various agencies throughout the State in the preparation of their financial budgets. The State, in 1917, took advantage of the Federal act which furnished aid to the States for the development of vocational education, under the provisions of the State law, the Board of Education being also the Vocational Board of Education; and vocational education was provided in both day and night schools. Vocational rehabilitation was also established with very satisfactory results The total enrollment in the State in 1914 was 67,147. This had increased, in 1922, to 76,670 (50,093 in county rural schools, 10,845 in city schools, and 15,732 in town schools). The ordinary expenditure for all schools was $4,362,756, in addition to which there were special levies amounting to over $2,000,000 The percentage of illiteracy in the State decreased from 23 4 in 1910 to 18 9 in 1920: among the native white population, from 18 8 to 15 2; among the foreign-born, from 31.2 to 28.6; among the Negro, from 15.9 to 4.4.

Finance. For finance, see STATE FINANCES.

Political and Other Events. An election was held in 1914 for Representatives in Congress and for certain State officials. At this election three amendments to the State constitution were voted on and carried. One of these provided that State and county officials may succeed themselves. Another reduced the term of State and county officials from four to two years, and a third repealed the clause on taxation in the constitution and eliminated the State Board of Equalization In elections the Republicans were generally successful. In 1916 the Democrats carried the State, electing A. A. Jones as United States Senator In the voting for president this year, President Wilson received 33,527 votes; Charles E Hughes, 31,152. The Democratic candidate for governor, E. C. De Baca, was elected, together with nearly half the other State officers In 1918 the Republicans again returned to power and elected their candidate for governor, O. A. Larrozolo. Albert B. Fall, Republican, was elected United States Senator. In 1920 elections were held for governor and other State officers. Merritt C. Mechem, Republican candidate, was elected governor. In the presidential voting of this year, W. G. Harding received 57,634 votes; J. M. Cox, 46,668. Senator Fall resigned in 1921 to become Secretary of the Interior in the cabinet of President Harding. At elections held to fill the vacancy caused by his appointment, Holm O. Bursum, Republican, was elected. The Democrats regained power in 1923, electing their candidate for governor, James F. Hinkle, and reëlected Senator Jones for the Senate. Governor Hinkle was inaugurated in January, 1923 In his inaugural address he condemned the State policy of road construction, urged the abolition of county boards of education, and proposed a State-wide primary law.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. In the Legislature of 1915, a workmen's compensation law was passed by the House but was defeated in the Senate. The Legislature of 1917 enacted a workmen's compensation law and amended the statutes relating to the administration of justice. In 1919, the Legislature amended the tax laws and created a State Board of Dental Examiners and a Girls' Welfare Board. It also provided for the recodification of the general banking law and authorized the commission form of government in cities of 10,000 or more population. In 1921, the Legislature made additional provisions for the protection of game, regulated the hours of labor for children, regulated the practice of chiropractic, created the office of county flood commissioner, and provided for emergency flood districts and their administration. It also prohibited gambling in the State, provided for a succession tax, created a Department of Public Welfare, and regulated and limited the working hours of women. The Legislature of 1923 proposed an amendment to increase the term of State officers in the State executive department and county officers from two to four years, passed a measure making it a felony to sell or give liquor to minors, and passed bills to facilitate cooperative marketing of agricultural products; provisions were made for creating associations for this purpose.

NEW ORLEANS. The largest city of Louisiana, and a port of entry. The population rose from 339,075 in 1910 to 387,219 in 1920 and to 410,000 by estimate of the Bureau of the Census for 1924. The most extensive work carried on by the city during the decade 1914–24 was the improvement of the port and the inner harbor by the construction of the Industrial Canal joining the Mississippi River and Lake Pontchartrain, an arm of the Gulf of Mexico The completion of this undertaking gave a new harbor of quiet water which varied 16 inches between high and low water as compared with the 19 feet variation of the river level, and also shortened the distance to deep water. The canal was 5⅓ miles long and 30 feet deep at low water, and was equipped with a concrete and steel lock 1020 by 150 feet and 68 feet from top to bottom. This was completed in 1923 and cost about $20.000,000. The east bank of the river was built up a considerable height by pumping mud from the river bottom by pipe-line dredge. Four concrete fireproof cotton warehouses and a large grain elevator were built on this land. Active city planning was started in 1920.

The successful campaigns which have been waged in New Orleans since the beginning of this century against disease and the conditions responsible for epidemics in the past has attracted the attention of medical men all over the world. Yellow fever, malaria, typhoid, and bubonic plague have all practically been eliminated from the health records of the city through the destruction of cisterns, the installation of a model water purification plant, the ratproofing of public buildings and docks, and the installation of an elaborate drainage system.

The value of building permits issued by the city increased from $1,790,514 in 1918 to $13,099,015 in 1923 and the property valuation from $443,157,725 to $521,956,873. Post office receipts rose from $1,269,874 in 1914 to $2,466,316 in 1923, and bank resources from $245,563,932 in 1921 to $297,017,705 in 1923. Exports in foreign commerce rose from 3,580,737 short tons in 1914 to 5,094,276 in 1922, and imports from 1,472,323 short tons to 5,119,663; coastwise shipping increased from 361,198 tons received and 603,863 tons shipped in 1914 to 957,623 tons received and 1,692,437 tons shipped in 1922. The number of persons engaged in manufacturing rose from 17,186 receiving $8,020,000 in wages and making products worth $78,794,000 in 1910 to 26,641 persons receiving $24,614,000 in wages and making products worth $182,799,000 in 1920. The number of public schools increased from 88 with an enrollment of 51,595 in 1920 to 108 with enrollment of 62,307 in 1924 In the years 1915–24, 60 miles of streets were newly paved, 54 miles of sewers laid, the fire department was motorized and 165 men were added to the personnel. See CITY PLANNING.

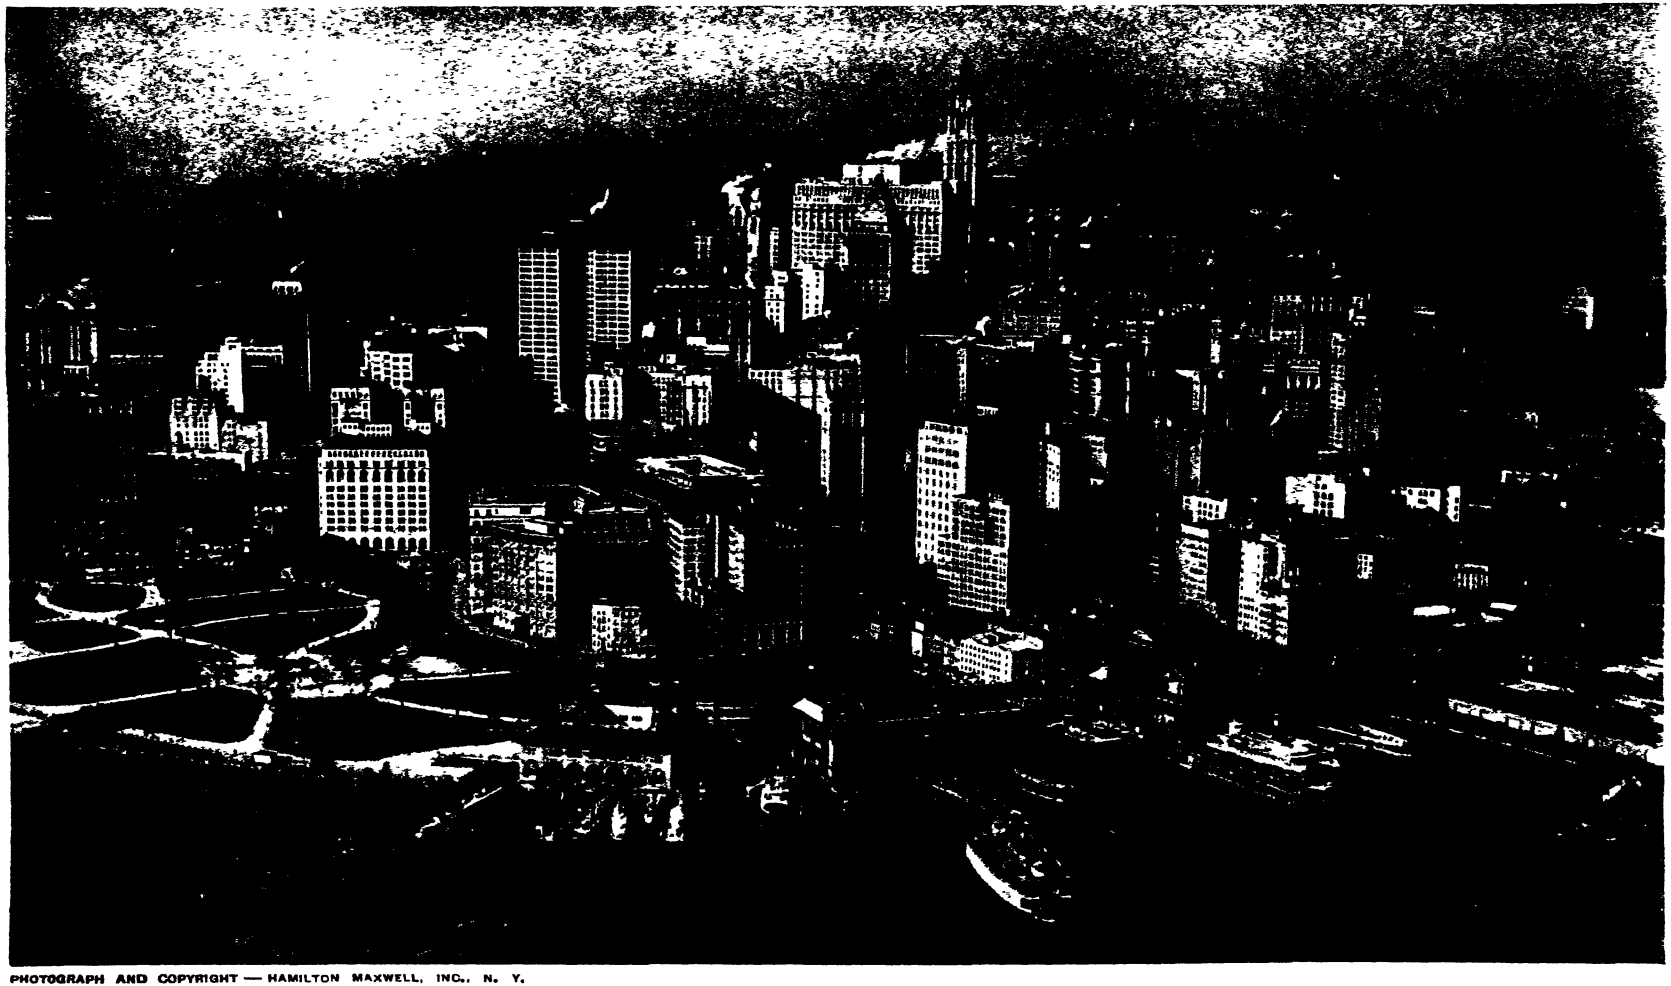
NEW SOUTH WALES. A constituent state of the Commonwealth of Australia in the southeastern part of the continent. Area, 310,372 square miles; population in 1911, 1,650,470; in 1921, 2,100,371, average annual increase, 2.4 per cent Sydney, the capital and largest city, with suburbs, had 955,900 inhabitants in 1922 (629,503 in 1911). Area under crops in 1912–13, 3,737,105 acres; in 1921–22, 4,445,828. Principal crops were wheat, maize, barley, oats, potatoes, and hay. Cane sugar, grapes, and citrus fruits were receiving increasing attention Grazing was of course a leading activity. Wool production in 1921–22 was 285,418,000 pounds, a falling off from the 326,804,000 pounds of 1912–13. Mining in 1921 yielded (1912 figure in parentheses): gold, £271,302 (£702,129); lead, silver, and silver-lead ore, £864,502 (£3,481,266); tin and tin ore, £163,451 (£338,074); copper, £41,267 (£579,791); zinc, £283,455 (£1,766,242); coal, £9,078,388 (£3,660,015); iron, £639,376 (£130,708). Manufacturing pursuits engaged 148,876 employees in 1921–22 (115,561 in 1912). Metal works and machinery, and plants concerned with food industries, were the most important. In 1921, the value of production of the various industries was: pastoral, £20,057,000; agricultural, £32,373,000; dairying, £16,447,000; forests and fisheries, £4,089,000; mining, £13,096,000; manufacturing, £42,192,000; total, £128,254,000. Imports overseas for 1913 and 1922 were £32,350,600 and £43,321,500; exports for the same years, £32,839,800 and £47,757,400. Leading exports were minerals, wool, dairy products, and meats. In 1922, 5116 miles of railway were open; in 1913, the number had been 4197 The operations of the government showed great increases in the period 1914–22. Total revenues for 1913–14 and 1921–22 were £18,438,228 and £35,637,820. Expenditures for the same years were £18,065,189 and £36,966,525. The public debt on June 30, 1913, was £100,170,747; by 1923 it had increased to £187,879,492. The Labor party gained its first impetus in New South Wales and continued to control the government more or less regularly.

NEW YORK. New York is the twenty-ninth State in size (49,204 square miles), and the first in population; capital, Albany. The population increased from 9,113,614 in 1910 to 10,385,227 in 1920; a gain of 14 per cent. The white population increased from 8,966,845 to 10,172,027; Negro, from 134,191 to 198,483; na-

tive white, from 6,237,573 to 7,385,915; and foreign-born white, from 2,729,272 to 2,786,112. The urban population of the State rose from 7,185,494 to 8,589,844, while the rural decreased from 1,907,210 to 1,795,383. The growth of the principal cities was as follows: New York (1910), 4,766,883 to (1920) 5,620,048; Buffalo, 423,715 to 506,775; Rochester, 218,149 to 295,750; Syracuse, 137,249 to 171,717; Albany, 100,253 to 113,344 (see articles on these cities).

Agriculture. New York, in common with nearly all the eastern States, showed a decline in agriculture, as compared with growth of population, in the decade 1910–20. While the population of the State increased 14 per cent, 1910–20, the rural population decreased from 27.1 per cent in 1900 to 21.2 per cent in 1910 and 17.3 per cent in 1920. The number of farms decreased 10.4 per cent (from 215,597 in 1910 to 193,195 in 1920); total acreage in farms, from 22,032,367 to 20,632,803, or 6.3 per cent, and the improved land in farms decreased from 14,844,039 to 13,158,781 acres, or 11.4 per cent. The total value of farm property in the State showed an apparent increase of 31.5 per cent, or from $1,451,481,495 in 1910 to $1,908,483,201 in 1920; the average value per farm, from $6732 to $9879. In interpreting these values, and, indeed, all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 193,195 farms in 1920, 151,717 were operated by owners, 4376 by managers, and 37,102 by tenants. The corresponding figures for 1910 were 166,674, 4051, and 44,872. White farmers in 1920 numbered 192,645, and colored farmers, 550. In 1910 the white farmers numbered 214,658 and the colored farmers, 939. The total number of cattle in 1920 was 2,144,244; in 1910, 2,423,003. The increase in number of dairy cattle, from 1,509,594 to 2,081,074, reflects the large growth of the dairy industry. The State had risen to second place in milk production, being exceeded only by Wisconsin. Sheep, in 1920, numbered 578,726, as compared with 930,300 in 1910; hogs, 600,560 as compared with 666,179. The estimated production of the principal crops in 1923 was as follows. corn, 24,408,000 bushels; spring wheat, 311,000 bushels; winter wheat, 7,895,000 bushels; oats, 32,552,000 bushels; rye, 945,000 bushels; barley, 5,168,000 bushels; potatoes, 29,813,000 bushels; tobacco, 2,272,000 pounds; buckwheat, 3,596,000 bushels; hay, 6,343,000 tons; and apples, 26,961,000 bushels. Comparative figures for 1913 are: corn, 15,020,000 bushels; wheat, 6,800,000; oats, 42,712,000; rye, 2,228,000; barley, 2,056,000; potatoes, 26,640,000; hay, 5,358,000 tons; and tobacco, 4,386,000 pounds.

Manufactures. New York is the most important of the manufacturing States, both in point of number of establishments and in value of product. In 1920, there were 58 cities with more than 10,000 inhabitants. These formed 78 per cent of the total population of the State, and in 1919 reported 87.5 per cent of the State's manufactured products. There were in the State 44,935 manufacturing establishments in 1909; 48,203 in 1914; and 49,330 in 1919. Persons engaged in manufacture numbered 1,203,241, 1,289,098, and 1,524,761; and capital invested amounted to $2,779,496,814, $3,334,277,526, and $6,012,082,567 in those years. The value of products amounted to $3,369,490,192 in 1909; $3,814,661,114 in 1914; and $8,867,004,906 in 1919. The large increase in value of products from 1914 to 1919 was due largely to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period; but the increase shown in number of wage earners clearly indicates decided growth in the manufacturing activities of the State. The most important industry in the State is the manufacture of women's clothing, the product of this industry being valued, in 1909, at $272,518,000; in 1914, at $345,316,000; and in 1919, at $886,984,000. The manufacture of men's clothing ranks second in point of value: in 1909, $266,075,000; in 1914, $238,627,000; and in 1919, $641,906,000. The refining of sugar, ranking third in this respect, was valued in 1914 at $124,941,000, and in 1919, at $268,318,000. Slaughtering and meat packing, in fourth place, had a product valued, in 1909, at $127,130,000; in 1914, at $148,106,000, and in 1919, at $265,726,000 The printing and publishing industry was next in value of product: in 1909, $216,946,000 1914, $257,268,000; and 1919, $478,898,000 The most important manufacturing cities are New York, Buffalo, and Rochester. In New York, there were 25,933 manufacturing establishments in 1909, with a product valued at $2,027,425,000; 29,621 in 1914, with $2,292,832,000; and 32,590 in 1919, with $5,260,708,000 Buffalo had 1753 establishments in 1909, with a product valued at $218,804,000; 2225 in 1914, with $247,516,000; and 2093 in 1919, with $634,410,000. Similar figures for Rochester were: 1203 in 1909, with $112,676,000; 1244 in 1914, with $140,697,000; and 1367 in 1919, with $351,416,000. The other important manufacturing cities are Albany, Binghamton, Niagara Falls, Schenectady, Syracuse, Troy, Utica, and Yonkers.



Mining. Although New York has limited metal mining, it ranked thirteenth among the States in 1921 in the value of its mineral products. The most important minerals are clay products, cement, stone, and salt. The progress of the clay and cement industries in the decade was as follows: In 1914 clay products were valued at $9,078,933; in 1916, $11,755,012; 1918, $9,581,796, 1920, $19,113,684; and in 1921, $17,432,086. Shipments of cement in 1914 were 5,713,383 barrels valued at $5,143,401; 1916, 5,707,892 barrels, $5,804,444; 1918, 4,074,159, $6,568,746; 1920, 6,049,150, $12,206,698; 1921, 4,993,341, $9,403,015. It will be noted that while the shipments of cement were practically the same in 1921, the price received was more than double, which was due chiefly to the inflation of currency. In addition to these two minerals, the State produces graphite, a considerable quantity of iron ore, mineral waters, natural gas, petroleum, and sand and gravel The total value of the mineral production in 1921 was $62,567,967, compared with $78,431,317 in 1920; $56,379,564 in 1919; $52,768,877 in 1918; and $36,420,134 in 1914.

Education. There was great progress in education in New York during the decade 1914–24. The Legislature in each year of that period passed a number of important measures.

In 1914, the establishment of the central rural schools was made possible, and in 1917 a measure was passed providing for central high-school districts; in the latter year, school elections in certain cities were regulated by the Legislature; amendments were made to the statutes relating to the boards of education in 1919; and in 1921 and 1922 the laws relating to compulsory education were amended. The Legislature of 1923 also made several important amendments to school laws: $75,000 was appropriated for the erection of an additional building at the State College for Teachers; a measure was enacted requiring the Commissioner of Education to prescribe courses of instruction in fire prevention; and a law was passed providing for State schools of agriculture in St. Lawrence, Alfred, Morrisville, Cobleskill, Delhi, and Farmingdale, under the supervision and direction of the Regents of the University and the Commissioner of Education. Vocational education, in general industrial schools, trade schools, schools of agriculture and home economics (also in part-time or continuation schools), was being carried on in all the larger and most of the smaller cities of the State. The benefits of the Smith-Hughes Act providing for vocational education were accepted by a legislative measure in 1917. Farm schools were established in most of the counties of the State. The registration of pupils increased from 1,532,151 in 1915 to 1,820,506 in 1922; the average attendance increased from 1,233,074 in 1914 to 1,518,781 in 1922. The percentage of illiteracy in the State decreased from 6.6 in 1910 to 6.4 in 1920: among the native white population, from 1.1 to 0.7 per cent; among the Negro, from 5.8 to 3.4. Among the foreign-born white population, it increased from 14.3 to 15.2 per cent.

Finance. For finance, see STATE FINANCES.

Political and Other Events. There was an abundance of political and other happenings in New York in the decade 1914–24. The political complexion of the State was for the larger part of the time Republican, while New York City remained Democratic. Elections were held in 1914 for governor, United States Senator, and members of the House of Representatives. Gov. Martin H. Glynn, who succeeded to the post on the impeachment and removal of Governor Sulzer in 1913, was a candidate of the Democratic party for reëlection The Republican nominee was Charles S. Whitman, former district attorney of New York City. For United States Senator, James W. Gerard, Democrat, was opposed by James Wadsworth, Jr, Republican. Whitman was elected governor, and Wadsworth, Senator. At this election delegates to a constitutional convention were chosen. In February of this year, Joseph Cassidy, former Democratic leader of Queens Borough of New York City, was convicted for selling a nomination for the Supreme Court. With him was convicted William Willett, who paid Cassidy $25,000 for the nomination. An attempt was made by an insane man in April of this year to assassinate Mayor Mitchel. The mayor escaped without serious injury. The constitutional convention authorized in 1914 began its session on Apr. 5, 1915, with Elihu Root as president. The session continued until September 9. The amendments proposed by the convention included woman suffrage and the adoption of a new constitution. The constitution was defeated by a large majority of 470,000; woman suffrage, by a vote of more than 200,000. In 1916 elections were held for United States Senator, governor, and other State officers. Senator Root declined renomination, and the Republicans nominated William M. Calder. A few weeks prior to the nominating primaries, Robert Bacon, former Secretary of State and ambassador to France, announced his candidacy; Calder, however, was nominated by a small majority. The Democratic candidate was William F. McCombs Calder was elected Senator, and Governor Whitman was reëlected. In the presidential voting of this year, Charles E. Hughes received 863,841 votes; President Wilson, 756,946. Elections were held for mayor of New York City and other cities in 1917. Mayor Mitchel was a candidate for reëlection on a Republican-Fusion ticket. The Democrats nominated John F. Hylan, who was elected by a large majority. On Oct. 12, 1917, the new Catskill aqueduct carrying water to New York City was opened. In June of this year a census of all persons of the State under the age of 45 years was taken, with the purpose of assigning all to some sort of service. Two military cantonments were established, one for the National Guard troops at Camp Mills, Mineola, and the other for the National Army at Camp Upton, Yaphank At the former were gathered troops of many States, including the former 69th Regiment of New York. In 1918 nominations were made for governor and other State officers at regular State primaries; the State convention had been abolished. Charles S. Whitman was renominated by the Republicans, and Alfred E. Smith, president of the Board of Aldermen of New York City, was named by the Democrats Smith was elected by a close vote. In 1920 Nathan L. Miller was nominated governor by the Republicans, and Governor Smith was renominated by the Democrats. Mr. Miller was elected, and James W. Wadsworth, Jr., was reëlected to the United States Senate. In the presidential voting of this year Warren G. Harding received 1,868,240 votes; James M. Cox, 781,485. At this election a referendum for a soldiers' bonus providing for a bond issue of $45,000,000 was passed by a large majority. Investigations were held in 1920 by the legislative committee into housing conditions. The committee exposed much corruption in the building trades. In 1921 elections were again held for municipal officers. The chief interest was in New York City, where John F. Hylan was a candidate for renomination. He was opposed by Maj Henry H. Curran, a candidate of various independent organizations. After a violent campaign, Hylan was reëlected by a plurality of more than 400,000 votes. At this election several amendments to the constitution were carried. One of these provided for a literacy test for voting, including the requirement that the voters should know the English language. The Court of Appeals on Aug. 31, 1921, declared the bonus act passed in 1920 unconstitutional. In 1922 a new election law went into effect. This abolished the primaries for certain State offices. Judges and United States Senators were nominated by the convention, while candidates for the House of Representatives, for State Legislature, and for local officers were nominated by primaries. For governor, Nathan I. Miller was nominated by the Republicans, while the Democrats nomi-

AIRPLANE VIEW OF THE LOWER PART OF MANHATTAN ISLAND FROM OFF THE BATTERY, 1924

long, to carry the water into the Ashokan reservoir. This was completed and opened in January, 1924.

The War Department ordered three of the piers of High Bridge to be removed from the centre of the Bronx River on the ground that they obstructed navigation. A long discussion followed as to the best method of fulfilling this demand; many urged that the old bridge be remodeled instead of demolished, because of its architectural beauty. In 1923 it was decided to replace the three masonry spans by a single steel arch, which was estimated to cost about $716,000.

Through coöperation of the two States, the New York and New Jersey Harbor Development Commission, called the Port Authority, was appointed in 1917. Its work affects 12 municipalities. Twelve piers between 1026 and 1137 feet long and from 125 to 209 feet wide, connected by rail with all the main railroads of New Jersey, were built on Staten Island in 1920–22. Extensive dredging was carried on to provide a 40-foot channel between Upper Bay and Brooklyn, and Coenties Reef and Shell Reef, which had hindered traffic, were removed. The Central Railroad of New Jersey built the largest coal-handling terminal in New York harbor; it connects by approximately 23 miles of track and cost more than $3,000,000. The Cunard Steamship Line began the construction of a group of eight piers 1000 feet long and one shorter pier at Weehawken, N. J., on the Hudson River, about opposite Thirty-sixth Street.

In 1916 a zoning plan was adopted by the city, to regulate the use to which buildings might be put, their height in relation to street widths, and the percentage of the area of the lots permitted to be covered The commission in charge of framing the plan, which was the first to be adopted by a city of any importance, made a survey of the city and held public hearings. The height of buildings was regulated chiefly by the width of the street on which they fronted, with variations for different parts of the city. A tower covering not more than one-fourth of the area of the lot, however, might be carried to any height; set-backs might also be used to increase somewhat the permitted height for the rest of the building. The Russell Sage Foundation in 1922 announced the inauguration of a project to make an inclusive plan for New York City and its environs as far as Bridgeport, Conn.; West Point, N. Y., and Princeton, N. J., and including all of Long Island and a large part of the New Jersey coast. The preliminary work on the plan consisted of extensive studies by the Foundation along social, economic, and physical lines.

The value of imports through New York increased from $1,040,380,526 in 1914 to $1,797,819,713 in 1923. The exports increased from $864,546,338 in 1914 to $1,518,852,197 in 1922. Bank clearings rose from $83,018,580,016 in 1914 to $213,996,182,727 in 1923. The capital invested in manufacturing rose from $1,364,352,683 in 1910 to $3,013,436,656 in 1919, and the value of the products from $2,029,692,576 to $5,259,477,577 in 1919. The value of the four leading manufactures increased as follows: women's clothing, from $266,471,381 in 1909 to $866,243,561 in 1919; men's clothing, from $218,411,030 to $564,407,739; printing and publishing, from $183,509,157 to $411,138,928; slaughtering, from $95,862,000 to $191,837,831.

NEW YORK, College of the City of. A free municipal college at Washington Heights, New York City, established in 1848 by the Board of Education of the city. The student enrollment rose from 7998 in 1914 to 18,755 in 1924, the faculty from 218 to 480 members, and the annual income from $684,963 to $1,395,678. The number of bound volumes in the main library, exclusive of pamphlets, increased from 47,589 to 66,165, and the volumes in the departmental libraries from 16,565 to about 20,000 volumes. Departments were established during the period in engineering and military science, the departments of Greek and Latin were consolidated into the department of classical languages, the department of natural history was divided into the departments of biology and geology, and the department of political science into departments of economics and government and sociology. A course leading to the degree of Bachelor of Science in Social Science, in addition to the previously existing courses leading to the degrees of Bachelor of Arts and Bachelor of Science, was established in 1916. The Brooklyn branch of the evening session was begun in the following year and the entire evening session was opened to women; also, in 1917, a summer session was established. In 1919, the first professional schools, of Technology and Business and Civic Administration, with their own deans and faculties, were founded, and the college was given the name of the College of Liberal Arts and Science. The work of the School of Business was carried on not only in the Washington Heights buildings and the evening session in Brooklyn, but also at the original building of the college at Twenty-third Street and Lexington Avenue. The third professional School of Education was founded on similar terms in 1921; its work was carried on in the Washington Heights buildings and at various centres in different boroughs in the city. President, Sidney Edward Mezes, Ph.D., LL.D.

NEW YORK PHILHARMONIC SOCIETY. See Music, *Orchestras*

NEW YORK STATE COLLEGE FOR TEACHERS. A coeducational State institution for the training of high-school teachers at Albany, N. Y., founded as a State normal school in 1844, and chartered as the State College for Teachers by the Board of Regents in 1905. Courses are offered in liberal arts and sciences, in commercial education, and in household economics, and a graduate course in education. The student enrollment was increased from 450 in 1914 to 971 in 1923-24, and the income from legislative appropriations increased from $97,000 to $260,000. In 1923, the Legislature appropriated money for the construction of William J. Milne Hall, providing facilities for a practice high school, laboratories in household economics and biology, and a large lecture hall and recitation rooms; and the alumni pledged $150,000 for a residence hall. In addition to a special reference library the college uses the State Library of 1,500,000 volumes, Abram Royer Brubacher became president in 1915.

NEW YORK SYMPHONY ORCHESTRA. See Music, *Orchestras*

NEW YORK UNIVERSITY. A nonsectarian institution in New York City, char-

tered in 1831. The university increased its enrollment from 5233 in 1914 to 16,482 in 1923–24. The Graduate Division of Business Administration was established in 1916; two new degrees were authorized—Master of Business Administration in 1920 and Doctor of Commercial Science in 1923—and the Division of Oriental Commerce and Politics was inaugurated. The Ingram Institute for Economic Education and the School of Retailing were founded in 1918, and the degree of Master of Science in Retailing was authorized in 1921. In 1920, the name of the School of Applied Science was changed to the College of Engineering. A steam engineering plant was built in 1919 and the Sage Engineering Building, for which about $250,000 worth of equipment was assembled, was authorized in the same year. The engineering research laboratory was built at University Heights in 1920–21 at a cost of $345,000. Evening courses were started in the college in 1921, and in 1923 plans were made for courses in aëronautical engineering. During the summer of 1918, the faculties and equipment of the Engineering College were placed at the disposal of the government for training soldiers.

The Medical College was opened to women in 1918. In 1921, the State bacteriological laboratory was built at a cost of $105,000, and the Helen Hartley Jenkins gift of $150,000 was received. Medical preparatory courses were offered at the Flower Hospital, and medical and dental preparatory courses in the evenings at the Washington Irving High School During the War, instruction was given at the college to Medical Reserve Corps officers. The School of Pedagogy was renamed the School of Education and an undergraduate division was established. By arrangement with the Chautauqua Institution in 1923, summer courses in education were given at Chautauqua, N. Y. The Veterinary College was temporarily closed in 1922. The productive endowment increased from $1,225,227 in 1914 to $2,923,988 in 1924, and the budget from $592,391 to $2,353,132. During the 10 years the following buildings were bought or erected: the Trinity building for the Wall Street division of the School of Commerce ($222,670), the university apartment house ($340,000), an addition to the chemistry laboratory at University Heights ($45,000), and a residence house at University Heights ($8650). Five floors of the Washington Square building were taken over and altered for classroom use at a cost of $640,000 and the mortgage was reduced from $550,000 to $350,000, additional space was leased in the Greenwich building, and the Moynihan property was acquired at a cost of $25,000. Between 1914 and 1923, the gifts received totaled $4,031,619. The total assets of the university increased from $5,970,418 to $8,582,692. Chancellor, Elmer Ellsworth Brown, Ph.D., LL.D.

NEW ZEALAND. A British dominion in the southern Pacific, made up principally of North and South Islands, with Steward Island included. Area, 103,862 square miles; population in 1911, exclusive of Maoris, 1,008,468; in 1921, 1,218,913; average annual increase, 2.2 per cent. Estimated population in 1923, 1,271,741. Maoris in that year numbered 53,560. The birth rate in 1921 was 23.34 per 1000 (26.48 in 1912); the death rate, 8.73 (8.87 in 1912); and the marriage rate, 8.69 (8.81 in 1912). In 1922, the excess of immigration over emigration was 7402 (in 1912, 8927). Estimated populations of chief towns, with suburbs, on Apr. 1, 1923 (1911 figure in parentheses): Auckland, 167,760 (102,676); Wellington, 112,070 (70,729); Christchurch, 113,400 (80,193); Dunedin, 75,050 (64,237). At the end of 1922 there were 2550 public primary schools with a registration of 242,466; 36 endowed secondary schools with 10,736 pupils; 146 native schools with 6161 pupils; 4 university colleges with 3683 students. The total expenditure for public education in 1921–22 was £3,497,000; in 1912–13 it had been £1,334,599.

Agriculture. Of the total area of 66,292,232 acres in the Dominion, 27,390,625 acres had been alienated, including 9,978,608 acres reserved by the state, and 5,066,197 acres were held by natives Deducting barren lands, roads, etc., only some 3,000,000 acres remained to be disposed of by 1921. The cultivated area increased, for in January, 1923, 18,417,489 acres were under cultivation, as compared with 16,265,890 acres in 1910–11. The great proportion of the land was under grass seed. The wheat area consistently increased, reaching 352,918 acres in 1922 (189,869 in 1913) while oats showed the greatest loss, dropping from 386,786 acres in 1913 to 170,655 in 1922. Pastoral pursuits were far more important. Over the period 1911–23 these activities held their own. Live stock for 1911 and 1923 showed: horses, 404,284 and 330,818; cattle, 2,020,171 and 3,480,694; sheep, 23,996,126 and 23,081,439; swine, 348,754 and 400,889. Exports of pastoral products for 1913 and 1922 were:

Year	Wool	Frozen Meats	Butter	Cheese
1913	186 533,036 lbs.	2,578,693 cwts	372,258 cwts.	611,633 cwts.
1922	321,533,215 "	3,518,004 "	1,120,200 "	1,161,196 "

During the decade, wool production consistently declined except for the years 1919 and 1922, while dairy products rose regularly. By 1922–23, 41 per cent of the exports were made up of dairy products and only 26 per cent wool.

Manufacturing. From 1910 to 1921 advances in manufacturing were important. While factories only increased from 4402 to 4804, the number of hands increased from 56,234 to 70,255 and capital from £16,731,359 to £39,564,837. The total value of products in 1920–21 was £82,473,569; of this, meat freezing and preserving accounted for £13,669,102; butter and cheese factories, for £19,002,047. Hydro-electric schemes were under consideration after the War because of the decreasing local coal production. A plant was being erected at Mangahao (North Island) which was to supply eventually 160,000 horse power. Similar projects were reviewed for South Island

Mining. Gold production continued to decrease; exports in 1906 were 563,843 ounces; in 1921, 149,595. The coal consumption in 1921 was 1,755,912 tons, of which about one-fifth was imported, mainly from Australia.

Commerce. Imports for 1913, 1920, and 1922–23, were £22,288,302, £61,595,828, and £37,-

330,000. Exports for the same years were £22,986,722, £46,441,946, and £45,549,000. The favorable balance of £8,219,000 for 1922–23, among the highest for the period, was surpassed only in 1915, 1917, and 1919. Proportions of value by countries of origin of New Zealand's imports for 1913 and 1921 were: the United Kingdom, 60 and 50 per cent; other British possessions, 24 and 26 per cent; the United States, 9 and 18 per cent. Proportions for exports were: the United Kingdom, 80 and 87 per cent; other British possessions, 14 and 6 per cent; the United States, 3 and 6 per cent. For 1922–23, imports from the United States dropped to £5,378,000 The most important American products were automobiles and machinery. In 1913, 645 vessels of 1,738,985 tons entered and 635 vessels of 1,699,807 tons cleared New Zealand ports; in 1921, 678 vessels of 1,940,236 tons entered and 678 vessels of 1,944,341 tons cleared.

Communications. In 1923 there were 3028 miles of government-owned railways and only 135 miles of private lines In 1914 government railways aggregated 2863 miles.

Finance and Economic Conditions. Total revenues were, for 1913–14, £11,961,493; for 1921–22, £28,127,000. Total expenditures for the same years were £11,825,864 and £28,466,838. Estimates for 1922–23 were: revenues, £26,250,000, and expenditures, £29,438,215. The public debt in 1914 was £99,730,427; in 1922, £219,054,385, of which war expenditures (1914–19) accounted for £80,000,000 The cost of living steadily mounted over the period 1913–22. Retail price figures, based on the 1909–13 average as 1000, were for 1913, 1034; for 1918, 1346, for 1921, 1620. Wages kept pace, as may be seen by the following index numbers, also based on the 1909–13 average as 1000: 1918, 1231; 1921, 1697.5; 1922, 1746.35. The exchange for the pound sterling was 1913, $4.86; 1921, $3.84, 1922, $4.43; 1923, $4 567

History. The break-up of the Liberal party gave the Reform party its first opportunity in 21 years. On the failure of Sir Joseph Ward to form a ministry and after another unsuccessful attempt on the part of the Liberals, W. F. Massey, leader of the Opposition, created a Reform government on July 10, 1912. For the next decade his dominant personality ruled the political destinies of the Dominion Important administrative reforms were undertaken, aiming at further decentralization in the governmental machinery as well as reformation of the legislative council. The land question, which had always been vexing, was brought nearer to settlement when the law of 1912 allowed settlers on improved land to purchase their holdings. It became evident therefore that the state had relinquished its early policy in the direction of state participation in the benefits of the accumulated unearned increment. The extreme state socialism which had been typical of New Zealand history up to 1911 and which was made possible by the union of the Labor elements with the Liberal party, was abruptly terminated as the industrialization of the country proceeded and the stratification into classes became more perceptible. The farmers had become more conservative as bulwarks were erected for the safeguarding of private property; the laboring classes had become more radical with the appearance of a wealthy group in the population. The result was the growth of the Labor party, on one hand, and on the other, the decision of workers not to accept decrees of the Arbitration Court but to try their strength in the strike. Bitter industrial conflicts became frequent, those of 1912 and 1913 being characterized particularly by ill-feeling.

The War momentarily put a period to all internal questions. Volunteer forces were raised for action in German Samoa; the government was empowered to fix prices and to suspend the labor laws, rent laws were passed (1916), and in 1915 a coalition cabinet was formed for the more effective prosecution of the War. In 1916 a conscription act was passed, though not without opposition, for in 1917, the coal miners went on strike to secure total exemption. Before the end of the War a total of 124,121 men had been enrolled in the army, about 90,000 of them volunteers. War financing was based on loans rather than revenues, although some increases were made in taxation, notably in higher income taxes, stamp duties, customs, railway fares, etc. Beginning with 1916 several loans were floated to an approximate total of £100,000,000. The easy success with which all this was accomplished was due to the unprecedented prosperity which the Dominion enjoyed throughout the War. Most of New Zealand's exports, meats, cheese, wool, hides, sheepskins, were contracted for by the British government, and though prices were fixed, sales reached enormous proportions. By 1921, more than £160,000,000 in produce was sold in this fashion. In spite of the rise in the cost of living, therefore, no class of society was touched by want. Through the fixing of prices of household necessities by the Board of Trade, the importation of wheat in 1918, when a local shortage impended, and the purchase of sugar abroad, retail prices were kept within reason. By the agency of the Court of Arbitration wages were reviewed and increased to meet mounting costs.

In 1919 the coalition came to an end with the withdrawal of Sir Joseph Ward from the cabinet. The election which followed indicated the increasingly radical temper of Labor. The marked syndicalist tinge which industrial agitation had taken on was reflected in the outspoken socialist political platform of the Labor party The election results, however, showed the inherent conservatism of the average voters. Massey's Reform party elected 47 members, the Liberals only 20, and Labor 8, although the popular vote showed a ballot hardly in proportion to the great victory of the Reform party. This was due to the three-cornered fight in most constituencies. Labor troubles continued through 1919 and 1920, and the latter year was marked by a general strike of the railway workers. The world depression of 1921, which struck the farmers in particular, and the general unemployment were reflected in the political realignments. In the 1922 elections the government seats were reduced to 38; Liberals elected 25; Labor, 17. Two questions of importance locally were the status of the repatriated soldiers and the vote on prohibition. Beginning with 1915 pension and settlement acts were put on the statute-books, so that by 1921 upward of 35,000 pensions had been granted and more than 7000 soldiers settled on the land A repatriation department was created for the vocational guidance of men who had fought in the War. By 1922 more

than £30,000,000 had been spent in this work of repatriation. Polls continued to be taken on national prohibition. By the law of 1918 a triennial vote was ordered on three alternatives, prohibition, license, and state control. A majority of the total vote cast was made necessary for passage. The 1919 vote gave prohibition only a plurality. The same was true also of the 1922 vote

The appointment of Lord Jellicoe in 1920 as governor general of the Dominion brought the question of national defense to the forefront as an issue of major importance. The question of an independent New Zealand naval unit came up for serious consideration time and again. The Dominion appeared to accept complacently its status under the Empire, and although it had a place as a member of the League of Nations and also had a mandate over German Samoa, there was no movement in public opinion toward a wider independence.

NEY, ELLY (1882–). A German pianist, born at Düsseldorf. After graduation from the Cologne Conservatory, where her teachers were I. Seiss and K. Böttcher, she went for further study to Leschetizky and Sauer in Vienna and won both the Ibach and the Mendelssohn prizes For several years she taught at the Cologne Conservatory. Her tours of Germany, Austria, Russia, and Scandinavia established her reputation as one of the greatest of contemporary pianists, irrespective of sex. At her American début (New York, Oct. 15, 1921) she took her audience by storm and immediately became a prime favorite. She later made annual tours of the States. In 1911 she married the Dutch conductor, Willem Van Hoogstraten.

NICARAGUA. The largest of the Central American republics, with an area estimated at 49,200 square miles; population (according to census of 1920), 638,119 In 1910 the population was estimated at 600,000. At least 75 per cent of the inhabitants lived in the western half of the country. Capital, Managua, with a population of 60,342. Other large towns are: Leon (47,234), Granada (21,925), Matagalpa (32,271), Masaya (17,287). Illiteracy among the population was still high, and school attendance was not much in excess of that of 1912 In 1922–23 there were 344 elementary schools with 21,657 pupils.

Industry and Trade. The agricultural products of the western half were varied; coffee, sugar cane, wheat, cacao, and beans were grown. The average annual crop of coffee was placed at 25,000,000 pounds. In 1921, the export value of coffee was $2,352,487, and the 1922 exports were worth $2,300,572. Sugar exports in 1921 were worth $91,308,653. The sugar industry took its inception from the great demand created during the War. Exports of sugar in 1916 totaled only 3034 metric tons; in 1922, this export was 9948 tons. The export to the United States alone in 1923 was valued at $842,697. The banana was the principal crop grown in the east. The banana exports in 1923 were 3,487,985 stems, compared with 2,617,765 in 1922. Timber and forest products also played an important part in Nicaragua's foreign trade. Gold exports averaged $1,000,000 yearly. Practically all exports of lumber and gold went to the United States. In 1922 imports into Nicaragua were valued at $5,123,505 ($5,604,300 in 1913); exports in 1922, $7,903,446 ($7,494,100 in 1913). Proportions in 1922 by countries of origin of imports were: the United States, 80 per cent (50 in 1912); the United Kingdom, 9 per cent (19 in 1912); France, 2 per cent (5 in 1912); Germany, 1 per cent (12 in 1912). Leading imports were cotton goods, chemicals, iron and steel, and wheat flour. Proportions in 1922 by countries of destination of exports were: the United States, 71 per cent (46 in 1912); France, 16 per cent (16 in 1912); the United Kingdom, 3 per cent (13 in 1912). The 1919 foreign trade was the largest in the history of the country; this was due to the excellent return received for the large coffee crop. Total exports were $12,409,473. Almost 28 per cent of Nicaragua's exports were taken in that year by France. France's decision to resume her high duties on coffee accounted for the decreased value of shipments in the ensuing years. The isolation of the Atlantic coast, with communications between the west and the east by way of Costa Rica and Panama, led the government to survey a route from San Miguelito on Lake Nicaragua to Monkey Point on the Atlantic, and in 1921 a loan of $9,000,000 was secured in New York for this and other purposes. The national railways also passed into the hands of New York bankers for $2,000,000. In 1920 also, work was begun on a railway from Chinandega to Playa Grande on the Gulf of Fonseca, as a link in the International Railways chain. Total railway mileage in January, 1924, was 145 miles, exclusive of small private lines. There were 3637 miles of telegraph wire and 805 miles of telephone wire in 1921.

Finance. For 1921–22 revenues were $2,803,244 ($2,479,313 in 1914) and expenditures $2,787,673 ($1,980,328 in 1914). Total external debt in February, 1922, was $5,911,362; internal debt, $3,462,884. As a result of the ambitious financial scheme of 1917, the size of the debt consistently decreased. By the programme a rigorous budget was laid out; financing of deferred interest was provided for; the floating debt was settled. Credit so improved that in 1921 a loan of $9,000,000 was raised, part of which was to be applied toward the redemption of the 1909 bonds. The total indebtedness of Nicaragua on Mar. 31, 1923, was $9,294,781. On Dec. 31, 1923, there were only 2,581,609 cordobas (1 cordoba = $1) in circulation.

History. The continued interest of the United States in Nicaraguan affairs aroused the hostility of other Central American republics, and two of these, Costa Rica and Salvador, were led to sue Nicaragua in the Central American Court of Justice when the Bryan-Chamorro treaty was finally ratified by both parties in 1916. By this instrument, for the payment of $3,000,000 the United States acquired exclusive canal rights in Nicaragua, permission to construct a naval base on the Gulf of Fonseca, and the Corn Islands. Though the suits were successful, the decision was disregarded by Nicaragua and the United States. The continued stay of American marines in the country ensured the permanence of the government in power. Border outbreaks in 1921 and revolutionary disturbances in 1922, which for a time led to an attack on Chinandega by rebels, and a move on the capital in August, 1922, caused the holding of a conference by the presidents of Nicaragua, Honduras, and Salvador, on board the U.S.S. *Tacoma* in Fonseca Gulf on Aug. 22,

1922. Steps were taken to check revolts fomented by political emigrants and for the putting down of border uprisings by united action. The purpose of the general treaty of peace and friendship signed on Dec. 20, 1907, by all the Central American countries was reaffirmed. This move, fostered by Nicaragua, was in strange disharmony with its refusal to join the Central American Union erected in 1921. Nicaragua did, however, participate in the subsequent Central American conference at Washington and in the treaties signed there. (See CENTRAL AMERICAN UNION.) On May 8, 1917, Nicaragua declared war on Germany and as an Associate Power became an original member of the League of Nations. The president for 1916–20 was Emiliano Chamorro; for 1920–24, Dr. Diego Manuel Chamorro. The untimely death of Dr. Chamorro on Oct. 19, 1923, necessitated the ad interim assumption of presidential powers by the vice president, Bartolomeo Martinez, pending the election of a new president in October, 1924. For this election a new electoral law, drafted by an American, Dr. H. W. Dodds, secretary of the National Municipal League, had been adopted, and Dr Dodds was invited to assist in installing the new system. An offer by the Washington government to withdraw the force of American Marines which had been stationed in Nicaragua since 1912, unless the Nicaraguan government desired their continued presence to safeguard electoral freedom, elicited the reply that the Nicaraguan government desired the Legation guard to remain at least until the installation of a new administration in January, 1925

NICHOLAS (NIKOLAI NIKOLAIEVITCH), GRAND DUKE (1856–). A Russian general (see VOL. XVII). At the outbreak of the War he was given the supreme command of the Russian armies, and handling them with admirable skill, successfully overran East Prussia and caused such rearrangement of German plans as to relieve materially the hard-pressed French and British. Although defeated at some points by the great masses of Prussian shock troops hurled against him, he succeeded in extricating his armies from awkward positions in the Carpathian passes, and the Allies esteemed it a tragedy of first magnitude when domestic politics in 1915 induced the Czar to take Nicholas's place himself. The Grand Duke was sent to the Caucasus and there carried out the successful campaigns of Erzerum and Trebizond. After the revolution he lived in retirement, first in the Crimea, and then in a small village near Paris. In 1924 conservative Russians everywhere looked to him as the man most likely to accomplish national restoration in Russia.

NICHOLAS II (1868–1918). Emperor of Russia from 1894 (see VOL. XVII). The reactionary influences about the Emperor and his fatalistic temper prevented him from making any effective resistance during the early part of the War to those intent on his downfall. In March, 1917, when the President of the Duma telegraphed him demanding his abdication, he submitted with very little protest. He abdicated in favor of Grand Duke Michael, refusing to hand the power over to his son for fear of exposing the latter to the political storm that was brewing. The Grand Duke declined to accept the honor, unless the crown was tendered to him by the will of the people. At first it was planned to send the Imperial family to England, but the Provisional Government would not allow this, and Nicholas and his wife, son, and four daughters were transferred from Pskov to Tsarskoe Selo and then to Tobolsk, where they remained for several months. In 1918 they were taken to Ekaterinburg and given an apartment of only three rooms, and when Kolchak advanced in the Ural, the Communists, at a secret meeting, decided to put the Czar and his family to death. They were all shot in the cellar of the house where they had lived, and their bodies were removed to an isolated spot near Ekaterinburg and burned A few pieces of their clothing were afterward found at the place.

NICHOLS, ERNEST FOX (1869–1924). An American physicist (see VOL. XVII). He was professor of physics at Yale University from 1916 to 1920, director of pure science at the Nela Research Laboratories at Cleveland, Ohio, during 1920–21; and president of the Massachusetts Institute of Technology from March to November, 1921.

NICHOLS, J(ESSE) BROOKS (1885–). An American manufacturer, born at Dunkirk, N. Y., and educated at Yale University. From 1922 he was first vice president of the Franklin Baker Company, manufacturers of coconut products. After attending the Plattsburg Training Camp, he was commissioned first lieutenant in the United States Army, in 1916. He was later promoted to be captain and major and served in the North Russian campaign in 1918–19. He received the Croix de Guerre and other decorations from foreign countries. In 1920 he was commissioned lieutenant-colonel in the Officers' Reserve Corps.

NICHOLSON, WILLIAM (1872–). A painter and engraver, born at Newark, England, and educated at the Magnus School in Newark and at the Julien Academy at Paris As a student he produced good experimental work in wood engraving by using bold masses of black and white or of sombre grays and browns relieved by touches of bright color. He engraved many portraits, illustrated books, and collaborated with James Pryde in designing posters under the name of the Beggarstaff Brothers. During the War he contributed to the set of lithographs, "Britain's Aims and Ideals." As a painter he is known best for interior and still life subjects, although he has painted portraits and landscapes. He is represented in the Luxembourg and in many English galleries.

NIEHAUS, CHARLES HENRY (1855–). An American sculptor (see VOL. XVII). He has been remarkably prolific during recent years. His works include the Paul Jones monument at Washington, D. C.; the Commodore Perry monument, Buffalo, N. Y.; statues of Zachariah Chandler and Governor Click, National Capitol; Hernandez Cortez, Panama-Pacific Exposition; Francis Scott Key Memorial, Baltimore (1922), and war memorials at Hoboken and Newark, N. J.

NIELSEN, FRED KENELON (1879–). An American lawyer, born in Denmark, and educated at the University of Nebraska and the law department of Georgetown University. After admission to the bar he practiced law in Washington and was special agent of the General Loan Office from 1909 to 1911. From 1913 he was assistant solicitor to the Department of State, and in 1914, delegate at the con-

ference to conclude the treaty for the government of Spitzbergen. He served during the War as a major in the United States Army. At the Paris Peace Conference he was in charge of matters relating to treaties and claims against the enemy governments, and he was American representative in the drawing up of other treaties. President Wilson appointed him solicitor for the Department of State in 1920. He was reappointed to this position by President Harding. He served as technical expert at the Disarmament Conference in 1921–22.

NIELSEN, LUDOLF (1876–). A Danish composer, born at Nörre-Tvede, Denmark. At the Copenhagen Conservatory he studied under V. Tofte (violin), A. Orth (piano), and F. Hartmann (composition), and in 1903–04 he attended the Leipzig Conservatory As winner of the Ancker stipend he spent the year 1907 in travel and study in Germany, Austria, and Italy. From 1897 to 1907 he was solo violist and assistant conductor of the Tivoli orchestra and viola of the Björvig Quartet. He later lived in Copenhagen as teacher and composer. He wrote two operas, *Isabella* (Copenhagen, 1915) and *Uhret* (not produced up to 1924); three symphonies; the symphonic poems *Ragnar Lodbrog, Sommernatsstemning, In Memoriam, Fra Bjaergene,* and *Babelstaarnet; Romanze* for 'cello and orchestra; *Herbstabend,* recitation with orchestra; *St. Hans* for baritone, chorus, and orchestra; two string quartets; and choruses, songs, and piano numbers.

NIEMEN RIVER. See MEMEL.

NIGERIA. A British colony and protectorate in West Africa. The colony has an area of 1400 square miles; the protectorate, made up of the northern and southern provinces, has an area of 335,000 square miles. The total population was about 18,500,000, of whom 2800 were Europeans. The leading products of economic importance, measured by exports, were: nuts and palm kernels, exports in 1913, £3,109,818; in 1921, £3,574,184; palm oil, exports in 1913, £1,854,384; in 1921, £1,653,387; raw cotton, exports in 1913, £159,223; in 1921, £530,280; cocoa, exports in 1913, £157,480; in 1921, £350,085; tin, exports in 1913, £568,428; in 1921, £714,659; ground nuts, exports in 1913, £174,716; hides and skins, exports in 1913, £197,214; in 1921, £175,567. Other products were rubber, mahogany, ivory, live stock, ostrich feathers, and capsicums. Exports for 1913, 1920, and 1923, were £7,352,377, £16,987,018, and £11,672,000. Imports for the same years were £7,201,819, £25,216,507, and £11,457,000 Leading imports in 1921 were cotton piece goods and coopers' stores. High prices accounted for great advances manifested in the trade records of the years immediately following the War, though the year 1921 saw its world-wide depression reflected in Nigeria too. Shipping figures indicate the state of affairs: tonnage entered and cleared for 1913, 1920, and 1921 was 1,735,036 tons, 1,434,222, and 832,721. The importation of spirits was prohibited in 1919 with the result that a customs tax was placed on exports to fill out the territory's revenues Imports came mostly from the United Kingdom and the British colonies. In 1921, however, imports from the United States totaled £811,237. In 1923, of the total trade, 75 per cent was with the United Kingdom, 8 per cent with the United States, and 8 per cent with Germany. In 1924, 1250 miles of railway were open. Since 1914 an important line completed was the Port Harcourt-Enugu Ngwo of 151 miles, which opened up the colliery at Enugu Ngwo. Plans were laid for the extension of this railway to the north beyond the Benue River, to reach to Makurdi on the Benue in 1914. There was a network of excellent motor roads in the southern provinces, as well as several thousand miles of telegraph wire.

The cost of government mounted during the period 1914–24. Revenues increased from £3,462,507 in 1913 to £5,734,961 in 1924–25 (estimated), and expenditures from £2,916,801 to £5,995,582. The debt in 1913 was £8,267,569; in 1922, £13,609,209 The system of administrative centralization inaugurated in 1914 was continued. In 1917 an uprising in the West gave the government some concern, but it was soon checked. In 1923, to extend more fully the idea of local autonomy, the British government granted the whole of Nigeria a new constitution, embodying a provision for the erection of a legislative council

NITTI, FRANCESCO SAVERIO (1868–). An Italian statesman and author. He occupied many positions in the government and from 1911 to 1914 was Minister of Agriculture, Industry, and Commerce. He favored Italian intervention on the side of the Allies in the War and was a member of the special Italian mission to the United States in 1917. On his return he was appointed Minister of the Treasury. On the fall of the Orlando ministry in June, 1919, he became Prime Minister and held this office until May, 1920. He was for a time professor of economics at the University of Naples.

NIVELLE, ROBERT GEORGES (1856–1924). A French soldier, of English ancestry on his mother's side. He entered the artillery service of the army and at the outbreak of the War was a colonel. He greatly distinguished himself in the retreat from Mons and in the battle of the Marne in September, 1914, and was promoted to be chief assistant of General Pétain in the defense of Verdun. He succeeded to command in that sector and initiated and carried out a counteroffensive which, on Oct. 24, 1916, regained the forts of Douaumont and Vaux. He was appointed successor to General Joffre as commander-in-chief of the French armies of the North and East on Dec. 12, 1916. He planned and undertook a grand offensive on the Aisne front which failed to dislodge the Germans and resulted in immense losses to the French in April and May, 1917; on May 15 he was relieved of his post as commander-in-chief He was placed in command of the French forces in North Africa and held this position until 1919.

NOGUCHI, HIDEYO (1876–). A Japanese-American pathologist (see VOL. XVII). Dr. Noguchi's most striking achievement after joining the staff of the Rockefeller Institute was the discovery of the microörganism causing yellow fever. (See YELLOW FEVER.) In 1923 he published *Laboratory Diagnosis of Syphilis.*

NOLEN, JOHN (1869–). An American landscape architect and city planner, born at

Philadelphia, and educated at Pennsylvania, Munich, and Harvard Universities. From 1903 he was engaged in practice in Cambridge, Mass. His more important work includes the plans for the Agricultural School and Smith College at Northampton, Mass., for public institutions for Wisconsin, and for many private houses He drew comprehensive city plans and reports for the improvement of Roanoke, Va , Sacramento, Cal., and many other cities. During the War he was a member of the advisory housing committee of the Emergency Fleet Corporation and was consultant and designer for several towns for the United States Housing Corporation. His many writings on architectural subjects include *Madison, a Model City* (1910), and *New Ideals in the Planning of Cities, Towns, and Villages* (1919).

NORDAU, MAX SIMON (1849–1923). A Jewish author of Hungarian birth (see VOL. XVII). His reputation rests on his *Degeneration* (1895), which overshadowed all his subsequent works He was a resident of Paris and died there. His last publications were *Menschen und Menschliches von Heute* (1915) and *Franzosische Staatsmanner* (1916). He remained an ardent Zionist

NORDEN, N. LINDSAY (1887–). An American organist and composer, born in Philadelphia. He received his musical training in New York under M. Spicker, F. W. Robinson, A. Weld, and later, at Columbia University, under Prof C. Rybner From 1905 to 1909 he was musical director at St Mary's, and from 1909 to 1917, at All Saints' in Brooklyn. In 1917 he was appointed W W Gilchrist's successor as conductor of the Mendelssohn Club in Philadelphia, where he settled permanently the following year as organist and choirmaster at the Second Presbyterian Church, choirmaster at St. Paul's, and teacher at the Delancey School. In 1920 he became conductor of the Reading Choral Society, producing oratorios and choral works in the larger forms. Having become interested in the à cappella music of the Russian liturgy, of which he made a special study, he organized in 1912 the Æolian Choir of 60 trained voices, which he conducted until 1917, introducing to concert audiences works never heard in the United States outside the regular service in some of the larger Russian churches. This pioneer work he continued in Philadelphia with his choir of the Second Presbyterian Church. He edited a large collection of this music, about 80 numbers, with English translation His original compositions include an overture, *King Melville;* an orchestral sketch, *Silver Plume*, a cantata, *Thanatopsis*, many motets, anthems, and services and songs

NORDENSKIÖLD, NILS ERLAND HERBERT, BARON (1877–) A Swedish anthropologist (see VOL XVII) He wrote *Forskningar och Aventyr i Sydamerika* (1915), *An Ethnogeographic Analysis of the Material Culture of Two Indian Tribes in the Gran Chaco* (1919); *The Changes in the Material Culture of Two Indian Tribes under the Influence of New Surroundings* (1920); *The Copper and Bronze Ages in South America* (1921), *Deductions Suggested by the Geographical Distribution of Some Post-Columbian Words Used by the Indians of South America* (1922), and, in German, *Indianer und Weisse in Nord Ost Bolivien* (1922), and *Traumsagen aus den Anden* (1922).

NORDEN SOCIETY. See NORWAY, *History.*

NORDIC. See RACE PROBLEMS.

NOREEN, ADOLF GOTTHARD (1854–). A Swedish philologist of high reputation, many of whose works have been translated (see VOL. XVII) Since his book on Swedish names of places, he has published other works including an edition of Marcus Borgström's *Svenska Sprakets Historia for Folkskolseminarier* (1916).

NORFOLK. A port of entry for Virginia and the second port on the Atlantic coast in volume of exports. The population increased 71.6 per cent from 67,452 in 1910 to 115,777 in 1920 and to 164,105 by estimate of the Bureau of the Census for 1924. During the War the Federal government built an army base terminal at a cost of $29,000,000, which was afterwards leased and operated by the city. In 1918, the commission-manager type of government was adopted; city planning and zoning were established. A new $5,000,000 water system, adequate for a city of 1,000,000 population, was procured, two junior high schools and an industrial high school for negroes were built at a cost of $500,000 apiece, and 15 playgrounds were established and equipped. A municipal grain elevator and terminal of eight warehouses was built in 1923 at a cost of $5,000,000, and a municipal market was completed in the same year. Private building operations amounted to $5,368,971 in 1923, an increase of 110 per cent in 10 years; bank clearings to $417,592,524, an increase of 94 per cent, and the city budget to $7,234,148, an increase of 428 per cent. The total annual value of port commerce increased more than 800 per cent during the same period.

NORFOLK ISLAND. See PACIFIC OCEAN ISLANDS

NORMAL COLLEGE OF THE CITY OF NEW YORK. See HUNTER COLLEGE.

NORRIS, GEORGE WILLIAM (1861–). American legislator (see VOL XVI). He was reëlected to the United States Senate in 1918. He was one of the most prominent leaders of the so-called Progressive wing of the Republican party in the Senate and formed one of the "agricultural bloc" He was a candidate for reëlection in 1924

NORRIS, JAMES FLACK (1871–). An American chemist, born at Baltimore, Md , and educated at Johns Hopkins University During 1895–1904 he was connected with the chemical department of the Massachusetts Institute of Technology and in 1904 became professor of chemistry at Simmons College, but in 1915 he accepted a call to Vanderbilt University, where he remained a year He returned to the Institute of Technology and in 1920 became professor of organic chemistry there. He lectured on his specialty at Harvard (1912–14) and Clark University (1913–14). His original investigations have been chiefly in organic chemistry. He was an associate on the Naval Consulting Board in 1916 and during 1917–18 was connected with the gas defense work of the Bureau of Mines He served later in the Chemical Warfare Service, with the rank of lieutenant-colonel, and inspected the war gas factories of Germany. Dr Norris is the author of *The Principles of Organic Chemistry, Experimental Organic Chemistry,* and a *Textbook of Inorganic Chemistry.*

NORRIS, KATHLEEN (THOMPSON) (1880–). An American novelist (see VOL. XVII). Among her later books are *The Treasure*

(1915); *The Story of Julia Page* (1915); *The Heart of Rachel* (1916); *Undertow* (1917); *Martie, the Unconquered* (1917); *Josslyn's Wife* (1918); *Sisters* (1919); *Harriet and the Piper* (1920); *The Beloved Woman* (1921); *Lucretia Lombard* (1922); *Certain People of Importance* (1922); *Butterfly* (1923); and *The Callahans and the Murphys* (1924).

NORTH CAROLINA. North Carolina is the twenty-seventh State in size (52,426 square miles), and the fourteenth in population; capital, Raleigh. The population increased from 2,206,287 to 2,559,123, a gain of 16 per cent. The white population increased from 1,500,511 to 1,783,779; negro, from 697,843 to 763,407; native white, from 1,494,569 to 1,776,680; foreign-born (a very small proportion of the population), from 5942 to 7099. Both urban and rural populations increased during the decade: the former from 318,474 to 490,370; the latter from 1,887,813 to 2,068,753. The growth of the principal cities was as follows: Winston-Salem, 22,700 (1910), to 48,395 (1920); Charlotte, 34,014 to 46,338; Wilmington, 25,748 to 33,372; Asheville, 18,762 to 28,504.

Agriculture. As North Carolina is one of the cotton-producing States, it has been considerably affected by the advance of the boll weevil, which reached the State about 1920–21. The ravages of these insects, however, vary with the intensity of the winter (the cold killing many of them), so that while there was serious destruction in some sections, the effect on production was not as marked as it was farther South. The acreage planted to cotton in 1913 was 1,576,000 and the production 792,000 bales; in 1915, 1,282,000, 699,000 bales; in 1918, 1,600,000 and 898,000, in 1920, 1,587,000 and 925,000; in 1922, 1,626,000 and 852,000. The estimated production in 1923 was 877,000 bales. See COTTON; also BOLL WEEVIL.

While the population of the State increased 16 per cent in the decade 1910–20, the number of farms increased 6.3 per cent (from 253,725 to 269,763). The acreage of land in farms, however, showed a decrease of 10.8 per cent, or from 22,439,129 to 20,021,736; and the improved land in farms decreased 7 per cent, from 8,813,056 to 8,198,409 acres. The total value of farm property showed an apparent increase of 132.5 per cent in the decade, or from $537,716,210 to $1,250,166,995; the average value per farm, from $2119 to $4634. In interpreting these values and all comparative values in the decade 1914–24, the inflation of currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the 269,763 farms in 1920, 151,376 were operated by owners, 928 by managers, and 117,459 by tenants. The corresponding figures for 1910 were 145,320, 1118, and 107,287. White farmers in 1920 numbered 193,473, compared with 188,069 in 1910; colored farmers, almost entirely negroes, numbered 76,290, compared with 65,656. Farms free from mortgage in 1920 numbered 102,950, and those under mortgage, 24,499; in 1910, 117,028 were free from mortgage and 26,642 were mortgaged. The total number of cattle in 1920 was 644,779, of which 462,077 were dairy cattle; in 1910 the total number was 700,861 (308,914 dairy cattle). Sheep, in 1920, numbered 90,556, compared with 214,473 in 1910; hogs, 1,271,270, compared with 1,227,625. The estimated production of the principal farm crops in 1923 was as follows: corn, 54,405,000 bushels; wheat, 6,038,000 bushels; oats, 3,828,000 bushels; potatoes, 3,861,000 bushels; sweet potatoes, 10,126,000 bushels; tobacco, 355,266,000 pounds; hay, 657,000 tons. Comparative figures for 1913 are: corn, 55,282,000 bushels; wheat, 7,078,000; oats, 4,485,000; potatoes, 2,400,000; tobacco, 167,500,000 pounds.

Manufactures. While North Carolina is not one of the leading manufacturing States, it has great industrial importance. In 1920, there were 14 cities of more than 10,000 inhabitants, which formed 12.1 per cent of the total population; and in 1919 these reported 42.2 per cent of the value of the State's manufacturing products. There were in the State 4931 manufacturing establishments in 1909; 5507 in 1914; and 5999 in 1919. Persons engaged in manufacture numbered 133,453, 151,335, and 175,423; and the capital invested amounted to $217,185,588, $253,841,808, and $669,144,096, in those years. The value of the product in 1909 was $216,656,055; in 1914, $289,411,987; and in 1919, $943,807,049. The large increase in value of products was due largely to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the census period, 1914–1919, but the increase in number of persons engaged in manufacture clearly indicates steady growth in the manufacturing importance of the State. The manufacture of cotton ranks first in point of value of product in 1909, $72,680,000; 1914, $90,744,000; and 1919, $318,368,000. The manufacture of tobacco, cigars and cigarettes ranks second in this respect, valued in 1909 at $35,987,000; 1914, $57,861,000; and 1919, $259,824,000. Lumber and timber products, third in value, amounted to $33,525,000 in 1909; $39,632,000 in 1914; and $69,580,000 in 1919. The manufacture of cotton-seed oil and cake, next in order, had a product valued at $8,504,000 in 1909; $15,269,000 in 1914; and $46,995,000 in 1919. The chief manufacturing cities of the State are Winston-Salem, Durham and Charlotte. In Winston-Salem, there were 66 manufacturing establishments in 1909, with a product valued at $18,240,000; 73 in 1914, with $37,288,000; and 93 in 1919, with $200,485,000. Durham had 60 manufacturing establishments in 1909, with a product valued at $23,027,000; 62 in 1914, with $27,597,000; and 74 in 1919, with $70,659,000. Similar figures for Charlotte were: 108 in 1909, with $10,460,000; 107 in 1914, with $10,962,000; and 111 in 1919, with $43,096,000. Other important manufacturing cities are Greensboro, Raleigh, New Bern, Wilmington and Asheville.

Education. The educational problems in North Carolina are those of the other southern States that have a large colored population. During the decade 1914–24, steady progress was made. Schools were reorganized in 1919 and provision was made for a State Equalizing Fund, the purpose of which is to distribute as equally as possible the burden of supporting the county schools; the General Assembly had been setting apart a fund for this purpose for several years. The General Assembly of 1921 inaugurated a greatly improved tax system, which renders easier the raising of money for educational purposes. There was being developed in the State a system of public schools with the county as the unit of administration, in

contrast to a tendency in former years for the county to break up into small districts chartered by the General Assembly and made independent of the county authorities. The decision of the courts and legislative acts during the decade tended to make the county the unit and to bring all the small local tax or special charter districts under county control, giving to the county board of education very broad powers. The growth of the community high school was remarkable, especially in the last three years of the decade, the county districts being given as good high-school advantages as the towns and cities. Vocational training in agriculture and home economics was carried on in the public schools, having been made possible through acceptance of the provision of the Federal act that appropriates Federal funds to the States for this purpose The Legislature of 1921 created a Division of Negro Education, which was given general charge of the supervision of Negro schools in the State, and will undoubtedly result in great improvement in the schools. The school enrollment increased from 520,404 in 1910 to 752,698 in 1922; in the public high schools from 14,407 to 48,831. The total expenditure increased from $3,178,950 to $21,649,695. The percentage of illiteracy in the State decreased from 22 6 in 1910 to 16.9 in 1920: among the native white population from 15 to 10.7; among the foreign-born, from 8 1 to 7; among the negro, from 21 2 to 18.9

Finance. For finance, see STATE FINANCES.

Political and Other Events. North Carolina, in the decade 1914–24, remained steadily Democratic. In 1914 elections were held for United States Senator; Senator Overman was reelected. Democratic Representatives were elected to all districts except one In 1916 elections were held for governor and State officers. Thomas W. Bickett, nominated by the Democrats, was elected over the Republican nominee, Frank W Linney In the presidential voting, President Wilson received 168,383 votes; Charles E Hughes, 120,890. In 1918 elections were held for United States Senator and for other officers. Senator Simmons was reëlected Cameron Morrison, Democratic candidate, was elected governor in 1920, and Lee S. Overman was reëlected to the Senate. In the presidential voting of this year, J. M. Cox received 305,447 votes; and W G Harding, 232,848. The voters in 1922 rejected a proposed amendment to the constitution to increase the pay of members of the Legislature from $4 to $10 a day. Minor State officers were chosen at this election

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. In 1915 a proposed woman suffrage amendment was defeated in the House by a vote of 67 to 32. Bills designed to bring about an enforcement of the law against child labor also failed to pass. Measures regulating the sale of liquor in the State were enacted. In 1917 the Legislature amended the laws relating to criminal procedure, created a budget system, and provided for the voting of citizens absent in the national service. A commission was appointed to make a survey of the educational system. In 1919 the Legislature adopted the Federal prohibition amendment, on January 4 This Legislature also enacted measures forbidding child labor and passed an act requiring compulsory school attendance for children under 14 years of age. In the session of 1921 the banking institutions of the State were regulated, and provision was made for their more thorough supervision. Laws relating to attempted bribery were amended, and measures were passed for the promotion of coöperative marketing of farm products. A provision was also made for a State system of roads and for the development of agriculture and industry. The Legislature also made provision for the issue of bonds to enlarge and improve the educational and charitable institutions of the State. In 1923 a measure was passed by the Legislature creating a board to supervise the taxes of the State. A prohibition law was repealed and a law substituted providing prohibition against the transportation, manufacture, or sale of liquors containing more than .5 per cent alcohol. At this session was also created a system of mothers' pensions.

NORTH CAROLINA, UNIVERSITY OF A State institution at Chapel Hill, N C, founded in 1795. The university expanded considerably between 1914 and 1923–24, with a faculty of 85 and an enrollment of 981 in the former year as compared with a faculty of 165 and an enrollment of 2130 in the year 1923–24 and 1817 in the summer of 1923 The library was also increased during the decade from 75 000 to 119,625 volumes, and the income was increased from $170,000 to $927,774.25, of which $75,000 annually comes from the bequest of Mrs Robert W. Bingham received in 1917 and $40,000 from the gift of the General Education Board in 1920. Four new dormitories and three class buildings were put up between 1921 and 1923, and State funds were available in 1923–25 for four other dormitories and a building for the department of chemistry. A Student Union was being erected in 1923 from alumni subscription, and an Alumni Club from a private gift Harry Woodburn Chase succeeded Edward K. Graham, who died in 1918, as president

NORTHCLIFFE, ALFRED CHARLES WILLIAM HARMSWORTH, FIRST VISCOUNT (1865–1922). A British newspaper publisher (see VOL. XVII). His activities at the outbreak and during the course of the War were in many cases highly effective. He was strongly opposed to the administration of Lord Kitchener and was instrumental in bringing about his removal. Through his efforts also, the munitions department was placed on an efficient basis. He was an ardent supporter of Lloyd George and had much to do with the latter's accession to the premiership In 1917 he was appointed director of the Civil Aërial Transport Committee and chairman of the British War Mission to the United States; in the following year he was director of propaganda in the enemy countries. For his services during the War, he was created viscount in 1917 He died after a long siege of ill health on Aug. 14, 1922. He published several books, including one of his experiences at the front during the War.

NORTH DAKOTA. North Dakota is the sixteenth State in size (70,837 square miles), and the thirty-sixth in population; capital, Bismarck. The population increased from 577,056 in 1910 to 646,872 in 1920, a gain of 12.1 per cent. The white population increased from 569,855 to 639,954, the native white increasing from 413,697 to 508,451. The number of Indians decreased from 6486 to 6254; negroes, from 617 to 467; foreign-born whites, from

156,158 to 131,503. Both urban and rural populations mounted, the former from 63,236 to 88,239; the latter from 513,820 to 558,633. The growth of the principal cities was as follows: Fargo, 14,331 (1910), to 21,961 (1920); Grand Forks, 12,478 to 14,010; Minot, 6188 to 10,476.

Agriculture. As North Dakota is one of the largest grain-producing States, agricultural conditions in the decade 1910–20 were affected by the fluctuations in price and production of wheat and other grains resulting from conditions during and following the War. An account of the general agricultural situation will be found under AGRICULTURE, CORN, WHEAT. While the population of the Sate showed a growth of 12.1 per cent in the decade, the number of farms increased 4.5 per cent (from 74,360 in 1910 to 77,690 in 1920); the total acreage in farms from 28,426,650 to 36,214,751, or 27.4 per cent; and the improved land in farms, from 20,455,092 acres to 24,563,178, or 20.1 per cent. The percentage of the total area used for agricultural purposes increased from 63.3 in 1910 to 80.6 in 1920; the percentage of farm land improved decreased from 72 per cent to 67.8. The total value of farm property showed an apparent increase, from $974,814,205 in 1910 to $1,759,742,995 in 1920, or 80.5 per cent; the average value per farm, from $13,109 to $22,651. In interpreting these values, and all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 77,690 farms in 1920, 56,917 were operated by owners, 855 by managers, and 19,918 by tenants. The comparative figures for 1910 were 63,212, 484, and 10,664. White farmers in 1920 numbered 77,147, of whom 40,899 were native, and 36,248 foreign-born. In 1910, there were 73,617 white farmers; 35,750 native, and 37,867 foreign-born. In 1920, the colored farmers numbered 543, of whom 517 were Indians; in 1910, there were 743, of whom 721 were Indians. Farms free from mortgage in 1920 numbered 12,833, compared with 30,651 in 1910; those under mortgage, 40,462, compared with 31,727 in 1910—a reflection of the unfavorable agricultural condition after the War. The number of dairy cows in 1920 was 461,093, compared with 259,173 in 1910, indicating the development of dairy farming. The number of "beef cows" was 296,135, compared with 119,510; and the number of sheep increased from 241,392 to 298,912. The estimated production of the principal farm crops in 1923 was as follows: corn, 21,457,000 bushels; spring wheat, 62,352,000 bushels; oats, 57,950,000 bushels; rye, 10,046,000 bushels; barley, 22,783,000 bushels; potatoes, 12,764,000 bushels; hay, 1,450,000 tons, and flaxseed, 9,259,000 bushels. Comparative figures for 1913 are: corn, 10,800,000 bushels; wheat, 78,855,000; oats, 57,825,000; rye, 1,800,000; barley, 25,500,000; potatoes, 5,100,000; and hay, 388,000 tons.

Manufactures. North Dakota is not a State of great industrial importance. There were three cities in 1920 having more than 10,000 inhabitants. These formed 7.2 per cent of the total population in 1920, and reported 33.3 per cent of the value of the State's manufactured products in 1919. There were in the State 752 manufacturing establishments in 1909; 699 in 1914; and 894 in 1919. Persons engaged in manufacture numbered 4148, 4627, and 6148; and the capital invested amounted to $11,584,747, $14,213,302, and $24,548,833, in those years. The value of the manufactured products amounted to $19,137,506 in 1909; $21,147,431 in 1914; and $57,373,622 in 1919. The large increase in value of products is due largely to the change in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures between the industrial censuses of 1914 and 1919; but the increase in number of wage earners and in number of establishments is clear evidence of growth in the manufacturing activities of the State. The most important industry in point of value of product is flour and gristmilling. This, in 1909, amounted to $11,685,000; in 1914, to $12,030,000; and in 1919, to $29,282,000. The manufacture of butter ranks second in this respect, valued, in 1909, at $1,029,000; in 1914, $1,740,000; and in 1919, $11,122,000. Printing and publishing, ranking third, had a product valued at $1,910,000 in 1909; $2,220,000 in 1914; and $3,225,000 in 1919. Car construction and repair, in fourth place, had a product valued in 1909 at $680,000; in 1914, $1,235,000; and in 1919, $3,183,000. The principal manufacturing cities are Fargo, Grand Forks and Minot.

Education. Education has been one of the chief concerns of the citizens and government of North Dakota from the beginning of its Statehood, and progress in educational matters accelerated during the decade 1914–24. During this period there was a rapid increase in the number of standardized rural schools and in the consolidated schools of the State. Two normal schools were established at Minot and Dickinson, respectively, and the normal school at Valley City became the State Teachers College, granting a bachelor's degree. During the last few years of the decade a campaign against illiteracy was in progress. The legislative session of 1923 granted an appropriation for Americanization work which made it possible for the department to appoint a State director for adult education. The State was entering upon what was practically a period of reconstruction in education, and a new State education programme was being undertaken. The total enrollment in the public schools increased from 139,802 in 1910 to 168,446 in 1920. The total enrollment in the high schools in 1920 was 15,062. Total expenditure for education increased from $4,829,232 in 1910 to $13,306,724 in 1920. The percentage of illiteracy in the State decreased from 3.7 per cent in 1910 to 2.9 per cent in 1920: among the native white population, from 0.4 to 0.3; among the foreign-born white, from 5 to 4.9; and among the negro, from 6.8 to 6.7.

Finance. For finance, see STATE FINANCES.

Political and Other Events. The decade 1914–24 was notable in the political history of the State in that it marked the rise of the Non-Partisan League to a position of control, which brought about practically a Socialist form of government. Elections were held in 1914 for governor and United States Senator. L. B. Hanna, Republican, was elected governor and A. J. Gronna was reëlected Senator. The Non-Partisan League, an organization composed chiefly of farmers, and founded largely through the efforts of A. C. Townley, Socialist, had, by 1916, gained such strength that it was able to control the political situation. The success of

the League was due chiefly to a breach in the Republican party, which divided into factions, and partly to a prolonged newspaper agitation and conditions among the farmers which made the situation ripe for a political overturn. The League advocated the ownership by farmers of terminal elevators, banks and other facilities for marketing their crops. The State-wide primaries in June, 1916, endorsed candidates of this party, and the State Republican organization came under its control. In the elections in November, the League elected its entire State ticket, including L. J. Frazier for governor The League, however, supported Porter J. MacCumber for reëlection to the United States Senate. In the presidential voting of this year, President Wilson received 55,260 votes, and Charles E Hughes, 53,471 votes. The League, having gained full control of all departments of the State government, planned an extensive series of measures, largely along State ownership lines, including the ownership by the State of terminal grain elevators, packing plants, banks, and other organizations. In 1918, Governor Frazier was reëlected, together with the other State officers. At a referendum election held in 1919, the legislative programme of the Non-Partisan League (see *Legislation* below), was adopted. A C Townley, president of the League, was in 1919 found guilty under the State Sedition Law. The Non-Partisan League was continued in political power by the election, in 1920, of Governor Frazier, who was reëlected. The Republican-Non-Partisan candidate for the Senate, E. F. Ladd, was elected, defeating Senator Gronna. As the result of the carrying out of the programme of the Non-Partisan League during this year, the financial system of the State became severely embarrassed The League had established a State bank in which it was designed to compel the deposit of all public funds. This bank was to be the source of credit for carrying out their plans, and at one time it contained over $30,000,000 in deposits The people voted against the compulsory deposit of funds in the bank, and as a result there were withdrawn large amounts until the deposits amounted, in 1920, to only about $10,000,000 In spite of the action of the State Industrial Commission forbidding counties and towns to withdraw funds, the situation became extremely embarrassing and the programme of the League was largely discontinued. A plan to finance industries by the issue of bonds amounting to $17,000,000, failed. In the presidential voting of this year, W. G. Harding received 160,072 votes, and J. M. Cox, 37,422. Industrial and financial conditions continued to be bad in 1921, chiefly as a result of legislation passed in accordance with the programme of the Non-Partisan League The government system of North Dakota provides for the recall of public officials, and by a vote of recall Governor Frazier, the Attorney General, and the Commissioner of Agriculture and Labor, were recalled R. A. Nestos succeeded as governor. This action was a serious reverse to the Non-Partisan League. In the election of 1922, Governor Nestos was reëlected, defeating the Non-Partisan candidate. Lynn J. Frazier, however, was elected to the Senate. The Non-Partisan League also elected a State Auditor and other State officials. At the election of November, 1922, the people adopted a soldiers' bonus measure. This was declared unconstitutional by the State court on Feb. 10, 1923. Governor Nestos was inaugurated on Jan. 3, 1923. In his message he urged the revision of the system of taxation of the State and the curbing of expenditures. At presidential primary elections held early in 1924, President Coolidge received 50,539 votes, Senator La Follette, 37,052 votes, and Senator Johnson, 30,934 votes. William G. McAdoo was the unopposed Democratic nominee

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. In 1915, the Legislature abolished capital punishment In 1917, the Non-Partisan League was in control of the Legislature and a great mass of legislation was introduced along lines advocated by that body. The judicial system of the State was amended. The Torrens system of registration of land titles was put into effect. A constitutional amendment was proposed creating a Hale Insurance Fund for the protection of farmers' crops. A special session of the Legislature was held in 1918. This authorized the county to issue bonds and loan money to farmers on their personal notes. At this session a Federal Prohibition Amendment was ratified. The Legislature of 1919 created an industrial commission and authorized it "to conduct and manage, on behalf of the State, certain utilities, industries, enterprises and business projects." This commission was composed of the Governor, Attorney General and other State officers. The State bank and banking system were also adopted and an issue of $20,000,000 in bonds authorized for the establishment of the system. The Legislature also adopted an inheritance and income tax and created a State Board of Administration. Most of these measures were ratified by the people on June 22, 1919. The Legislature of 1919 also adopted an amendment authorizing the State to engage in any industry not specifically prohibited. In 1923, the Legislature passed a measure prohibiting expenditures of excessive appropriations. It passed measures regulating the use of liquor and increased the penalties for violation. It also enacted a measure forbidding the wearing of masks in public places with the intent to conceal the wearers' identity

NORTH DAKOTA, UNIVERSITY OF. A co-educational State institution at University Station, Grand Forks, N. D., founded in 1883. The student enrollment increased from 740 in 1914 to 1351 in 1923–24 and 445 in the summer of 1923 The faculty was increased during the same period from 80 to 109 members, and the library from 55,000 to 80,000 volumes. A chemistry building and an armory were completed in 1919 and a Law School building was opened in 1923. Frank Le Rond McVey, Ph.D., resigned from the presidency in 1917 and was succeeded by Thomas F. Kane, Ph.D., LL.D.

NORTHERN EPIRUS. See EPIRUS, NORTHERN.

NORTHERN TERRITORY. A territory of the Commonwealth of Australia, situated in the central and northern part of the continent. Area, 523,620 square miles; population, exclusive of aborigines, in 1911, 3310; in 1922, 3554. Occupation proceeded slowly; only 747 square miles had been alienated by 1921. Mineral production steadily declined so that by 1921–22 only £9908 in all was the value of the total yield (£55,299 in 1912). The trade records made a

similar showing: imports and exports for 1913, £20,977 and £67,911; for 1921–22, £12,115 and £5036. Revenues and expenditures over the period were: for 1913–14, £73,657 and £532,535; for 1921–1922, £71,239 and £289,062. Expenditures up to 1921 were heavy because of the Port Augusta Railway project. Up to June 30, 1922, the public debt, a charge on the Commonwealth, was £3,951,746. The policy of the government was to dispose of the lands by leasehold only.

NORTH POLE. See POLAR RESEARCH.

NORTH SCHLESWIG. See SCHLESWIG.

NORTH SHORE MUSIC FESTIVAL. See MUSIC, *Festivals.*

NORTHWEST TERRITORIES. The name of the unorganized territories (Franklin, Keewatin, and Mackenzie) of the Dominion of Canada, with an area of 1,242,224 square miles, and a population in 1911 of 6507 and in 1921 of 7988. Agriculture was carried on to a small extent only, because of the short summer season, but vegetable gardening was successful when tried, e.g. at Fort Resolution, Fort Smith, Fort Vermilion, and the Roman Catholic Mission at Salt Plain. With the discovery of oil at Fort Norman in 1920, interest in the territories quickened. Other minerals were known to exist, although up to 1924 they were little worked. There were lead and zinc ores on the south side of the Great Slave Lake; gold in the Liard and Peel Rivers; and gypsum, salt, and coal, in considerable quantities. The lake fisheries and forest wealth were still inadequately explored; furs made up 40 per cent of the total Canadian output. The government was carried on under the direction of a commissioner assisted by a deputy commissioner and a council of five.

NORTHWESTERN COLLEGE. A coeducational institution at Naperville, Ill, supported by the Evangelical Church but nonsectarian in its requirements; founded in 1861. The student enrollment and the number of members of the faculty increased steadily from 291 students and 29 instructors in 1916 to 502 students and 40 instructors in the year 1923–24. The library was increased from 12,500 volumes to 16,000 volumes in the same period In 1921, the college received an addition of $500,000 to its endowment, and $250,000 for building purposes, from the Forward Movement Campaign of the Evangelical Association, and in 1923 an addition of 41 acres was made to the campus through other gifts. President, Edward Everett Rall, Ph D.

NORTHWESTERN UNIVERSITY. A coeducational university composed of the College of Liberal Arts, College of Engineering, School of Music, School of Speech, School of Commerce, and the Medill School of Journalism, the Graduate School of Arts and Sciences, and the School of Education at Evanston, Ill.; the Dental School, Law School and part-time classes of the School of Commerce and the Medill School of Journalism at 31 West Lake Street, Chicago, and the Medical School at 2421 South Dearborn Street, Chicago. The College of Liberal Arts, the oldest school of the university, was founded in 1851. In 1923–24, the enrollment of the university was estimated at 9925, including the summer session and about 4000 students in the Chicago part-time courses in commerce and journalism. In 1914, the corresponding enrollment was 4138. The faculty in 1923–24, excluding the summer session lecturers, was 590 as contrasted with 450 in 1914. Walter Dill Scott, Ph.D, LL.D., was elected president in 1920 to succeed Lynn Harold Hough, LL.D., resigned.

NORTON, CHARLES DYER (1871–). An American banker, born at Oshkosh, Wis., and educated at Amherst College. For several years he was engaged in magazine and insurance work. In 1909–10 he was assistant secretary of the United States Treasury, and from 1910 to 1911, secretary to President Taft. He was in 1911 elected vice president of the First National Bank of New York City and in 1918 became president of the First Security Company. He was an official in many other corporations and a trustee of the Metropolitan Museum of Art, the American Academy in Rome, the American Federation of Arts, the Russell Sage Foundation, etc.

NORTON, THOMAS HERBERT (1851–). An American consul and chemist (see VOL XVII). From 1915 to 1917 he was detailed by the Department of Commerce to further the development of American chemical industries, especially dyestuffs. From 1917 to 1920 he was chemist with E I. du Pont de Nemours and Co. From 1917 to 1918 he edited *The Chemical Engineer*, and in 1920 he became editor of *The Chemical Color and Oil Daily.* Among his later writings are *Dyestuffs for the American Textile Industry* (1915); *Cottonseed Industry in Foreign Countries* (1915); *The Dyestuff Census* (1916); and *Tanning Materials of Latin America* (1917).

NORWAY. A kingdom in northern Europe with a total area of 124,964 3 square miles. Its population in 1920 was 2,649,775, of which the urban numbered 785,404. Chief cities were: Christiania, 258,483 (1910, 241,834); Bergen, 91,443 (1910, 84,330); Trondhjem, 55,030 (1910, 45,335); and Stavanger, 43,778 (1910, 37,261) The total population in 1910 was 2,391,782, of which 713,262 was urban.

Agriculture. Total area of land under cultivation was 9823 square kilometers, of which 2825 was natural meadow; total forest area, 71,055 square kilometers; unproductive land, 217,643 square kilometers. The following indicates the production of principal crops in metric tons for 1912 and 1923.

Crop	1912	1923
Wheat	8,821	15,975
Rye	24,697	18,847
Barley	73,353	71,456
Oats	198,483	116,112
Mixed grains		11,288
Potatoes	704,240	660,510
Hay	3,129,768	2,015,820

The following compares live stock figures for 1907 and 1918.

	Horses	Cattle	Sheep	Goats	Hogs
1907	170,325	1,027,520	991,211	222,717	163,467
1918	208,219	1,085,707	939,940	185,800	127,230

Foodstuffs for a value of 107,000,000 crowns were imported in 1922. Norway was dependent in large measure on imports of cereals and colonial produce, but, on the other hand, it exported animal and fish products to a large extent.

Industries. There was practically no domestic production of the nonmetallic minerals, but

coal was being mined quite extensively on the Island of Spitzbergen (q.v.) where production at full capacity, it was predicted, would be able to supply the greater part of Norwegian demands. Water power was abundant and was being greatly utilized; the quantity developed up to 1924 was approximately 1,400,000 turbine horse power. The chief mineral products were silver, copper, pyrites, iron ore, and nickel. In 1922, 3015 men were employed in the mining industry, and the total value of production was 20,677,000 crowns; the total output of all minerals was 683,588 metric tons. During 1923, 32 mining establishments employed 3400 workers. There were one silver smelting furnace, two electro steel furnaces, and three ferro-alloy furnaces in Norway during 1923. Norwegian forests and fisheries were the chief natural sources of wealth. The total value of fisheries during 1923 was 65,000,000 crowns The total area covered with forests was estimated at 71,055 square kilometers; value of planed and unplaned, sawn and unsawn timber products exported in 1923 was 73,358,364 crowns.

Transportation. Length of state railways, 2850 kilometers; private railways, 437 Passengers carried by state railways (1921) 24,222,677; private railways, 4,210,885. Volume of freight moved by state railways, 6,396,711 metric tons; by private railways, 609,370 metric tons.

Ocean Shipping. In 1923 vessels entering at Norwegian ports with cargo numbered 5824, with 3,192,407 net tons; in ballast, 2324 with 1,729,201 net tons. Vessels clearing from Norwegian ports with cargo numbered 6254 with 4,097,467 net tons; in ballast, 1966 with 898,441 net tons. The Norwegian merchant marine, on Dec 31, 1923, included the following: sailing vessels, 92; gross tonnage, 126,325; steamers and motorships, 1679; gross tonnage, 2,388,748, including only ships measuring more than 100 gross tons. Gross earnings of merchant marine in 1922 reached 462,600,000 crowns. Norway did an extensive carrying trade all over the world. Its principal ports are Christiania, Bergen, Trondhjem, Narvik, Fredriksstad, and Haugesund.

Foreign Trade. Imports in 1923 were estimated at 1,350,000,000 crowns; exports, at 831,200,000. Of the 1923 exports domestic goods were valued at 791,400,000 crowns; reexports, at 21,000,000; ships sold abroad, at approximately 19,000,000. Exports of Norwegian articles for 1923, grouped according to chief divisions, were as follows:

	Crowns
Live stock	1,097,437
Animal and fish products	170,542,777
Grains	986,825
Seeds and feedstuffs	5,018,510
Fruits, vegetables	336,802
Groceries	961,353
Liquors, alcohol	312,604
Spinning materials	1,917,582
Yarn, thread, and rope	2,461,940
Textiles	2,611,169
Hair, feathers, bone, horn products	23,962,468
Manufactures thereof	226,812
Lumber	70,412,595
Fats, oils, tar, rubber	65,799,176
Manufactures thereof	1,634,651
Finished timber products	2,945,769
Dyes and paints	2,096,795
Wood pulp, paper, etc., of which	269,492,944
Pulp	154,665,872
Carton	5,196,511
Paper	109,430,006
Other vegetable fibres and products thereof	235,977
Minerals, raw and semifinished, of which	81,871,242
Ores	25,359,792
Mineral manufactures, of which:	75,783,221
Fertilizers	39,060,227
Chemical products	21,446,218
Metals, raw and half finished	48,242,505
Metal manufactures	7,218,798
Ships, wagons, machinery [a]	8,460,146
Articles not specifically provided for	1,778,029
Total	791,408,127

[a] Not including ships sold abroad.

The principal countries of origin and destination for 1922 were:

	Imports from	Exports to
	Crowns	Crowns
Great Britain	294,372,200	231,716,418
Germany	283,314,420	76,364,142
Sweden	128,049,340	52,146,693
Denmark	103,920,040	35,819,246
Netherlands	58,594,370	14,272,282
Belgium	36,463,640	24,805,706
France	28,579,200	55,107,155
United States	243,450,290	90,340,474

Imports of the more important articles of consumption for 1923 showed: meat and meat products, 19,000 tons; grain and flour, 495,000; dairy products, 6725; fruits, 46,800; sugar, 58,200; tobacco, 2573; wines and liquors, 880,000 litres in bottles; wines and liquors in barrels, 3990 tons. Exports were: fish, 307,000 tons; canned fish products, 21,388 tons; cod liver oil, 249,748 hectoliters; lumber, 900,626 cubic meters; wood products, 923,700 tons

Finance. The national debt on May 31, 1923, stood at 1,570,000,000 crowns. The gold and silver stocks, on Dec. 31, 1923, totaled 147,300,000 crowns; the amount of paper currency outstanding, 384,800,000 crowns. The exchange, which at par is $.268 to the crown, stood at 6.83 crowns to $1 on Dec. 31, 1923, and at 7.42 crowns on Mar. 18, 1924. Over the period, the cost of living steadily mounted, as revealed by the fact that, on the average for a family of five persons with an income of 1500 crowns per annum in 1914 as 100, the index stood at 283 in December, 1921. On Feb. 15, 1924, it was 234.

History. Norway during the War showed the unsettled condition prevalent in all neutral countries. Norwegians were naturally averse to all participation in the conflict. And yet, because of the many ties that bound the whole western world together, economically, socially, and intellectually, it was inevitable that Norway should feel the weight of war profoundly. The policy of the Scandinavian countries gravitated toward the same end. By the end of August, 1914, the three countries had declared their neutrality; on December 19, agreements were definitely made by which all three pledged themselves to common action in the observance of this neutrality. Throughout the War these conferences continued, with the result that the northern peoples were more firmly drawn together than ever before. The amity with which events were discussed made a pleasant picture against the dark background of the turbulent

nationalistic aspirations of the rest of the European peoples. In fact, the movement thus started for the closer union of the Scandinavian populations soon reached an articulate form in the creation of the Norden Society in 1919. A Norwegian branch was opened on Apr. 12, 1919, an active publicity campaign was kept up, and year books were published. During the War extraordinary measures were necessary to shelter Norway's population as far as possible from the rigors of the hostilities. In November, 1914, a loan of $4,000,000 was voted to cover extraordinary military expenses, and the government tried to push the construction of the two warships then on the ways in English shipyards. A commission was created to regulate the importation and distribution of foodstuffs, and the fixing of prices was likewise established. Because of the setting up of the British blockade in 1914 and the restriction of shipping to a circumscribed area about Scandinavia, Norway's contact with the outside world, on which it depended so much for the continuance of its daily activities, was greatly hampered, and widespread distress ensued. Shipping suffered severely. In all, as a result of torpedoing and mines, 830 ships with a tonnage of 1,238,300 were lost, and about 2000 sailors were drowned. Yet in spite of difficulties that continuously increased, Norwegian sailors refused to be driven from the high seas and maintained their intercourse with countries at war, Great Britain in particular. As foodstuffs became scarce, prices naturally rose and labor unrest increased. In 1916, demonstrations and strikes for the increase of wages involved almost 150,000 workmen, with the result that the Storthing forced through a measure for compulsory arbitration. After the War, the return to regular conditions was slow. Norwegian workmen manifested a great interest in communist doctrines, and in 1919 and 1920 strikes, particularly on the railways, were frequent. Labor circles regarded sympathetically the attempts of Soviet Russia to open commercial relations in September, 1920, but the Norwegian government at first refused to take the step. In 1921 a commercial treaty was effected which granted Russia surprisingly liberal terms, and in March, 1924, *de jure* recognition was accorded. The Norwegian government even refused to press the claims of its nationals in Russia, which amounted to some 300,000,000 crowns. Other matters of national interest after the War were the appointment of a royal commission in 1920, after much agitation, for the consideration of the creation of industrial works councils; the passage by the Storthing in 1921 of a measure tantamount to limited prohibition, which forbade the importation of liquors having more than a 14 per cent alcohol content (in 1924 there was talk of repealing this measure); and the passage of a ship subsidy measure in 1922 which set aside 25,000,000 crowns for government aid. In 1922, the permanent Court of Arbitration at The Hague awarded $12,000,000 to Norway against the United States for the seizure of Norwegian ships in America's ports during the War. For Norway's claims to Spitzbergen, see SPITZBERGEN. Another international dispute which appeared well on the road to settlement, during the period, was the controversy with Denmark over the sovereignty of Greenland. In 1924 a convention was laid before the Norwegian Storthing and the Danish Rigsdag; it provided for an amicable understanding on important economic matters. See also BEAR ISLAND; JAN MAYEN; NAVIES OF THE WORLD.

NORWEGIAN LITERATURE. See SCANDINAVIAN LITERATURE.

NOTRE DAME, UNIVERSITY OF. A Roman Catholic institution for men, at Notre Dame, Ind., founded in 1842. The university increased its student enrollment from 1077 in 1913 to 1900 in the year 1923–24, and 738 in the summer of 1923; its faculty, during the same period, from 84 to 130, and its library from 65,000 to 105,000 volumes. A library was built in 1916, a chemistry laboratory in 1917, a Law College building in 1918, and two halls for freshmen and sophomores, in 1923. Gifts amounting to $645,000 were received in 1921. Rev. John Cavanaugh, C.S.C., was president until 1919, Rev. James A. Burns, C.S.C., Ph.D., 1919–22, Rev. Matthew J. Walsh, C.S.C., Ph.D., 1922– .

NOURISHMENT. See FOOD AND NUTRITION.

NOVÄES, GUIOMAR (1895–). A Brazilian pianist, born at Joao de Boa Vista. At the age of four she began to play by ear, and it was not until she was seven that she received regular lessons from Chiafarelli in São Paulo. Her progress was so rapid that after only two years of instruction she was exhibited as an infant prodigy, making frequent appearances, but at the same time continuing to work systematically. In 1909 she won a scholarship at the Paris Conservatoire, where she remained two years under I. Philipp and graduated as winner of the first prize. After her highly successful début in Paris (1911), she made tours of France, Germany, England, Italy, and Switzerland until 1913. During the next two years she concertized in Brazil and then appeared for the first time in the United States (New York, Nov. 11, 1915), where she won instantaneous and emphatic success. She later made several American tours. She married Ottavio Pinto in 1922.

NOVA SCOTIA. A Canadian maritime province with an area of 21,428 square miles. The population in 1911 was 492,338; in 1921, 523,837, which represented a gain of 6.4 per cent. Of the population in 1921, 56.7 per cent was rural as compared with 62.2 per cent in 1911. The leading cities, with their populations in 1921, were: Halifax, 58,372 (46,619 in 1911); Sydney, 22,545 (17,723 in 1911); Glace Bay, 17,007; Dartmouth, 7899; Amherst, 9998; New Glasgow, 8074; Sydney Mines, 8327; Truro, 7562. Cape Breton Island is an integral part of the province.

Industry. Agriculture remained the leading activity. The geographical situation of the province favored, as always, the cultivation of hay, and in 1923, 890,200 tons were cut. Other important crops were potatoes, oats, and wheat. The production of apples steadily increased so that by 1922 the yield was valued at $7,851,185, against the 1913 crop of $2,000,000; the 1922 crop was 1,891,852 barrels; the 1923 crop, 1,500,000 barrels. The growth of fodder crops and the presence of an important live stock industry made dairying particularly important. Butter production increased tenfold over the period 1911–21. The value of live stock products was put at $2,080,000 in 1923; wool was important. Agricultural products, in all, yielded $40,613,000 in 1923. Lumbering continued to be important. Forest products totaled $11,-

180,000 in 1922. Fisheries continued to absorb the attention of a considerable part of the population. Cod, lobsters, haddock, and mackerel comprised 83 per cent of the 1922 catch, with a total value of $10,207,444, as against $7,384,055 in 1913. In this 19,495 men were engaged, and the whole industry represented a capital of $8,760,000; 4380 men worked in the canneries, which had a total capitalization of $3,801,700. Bituminous coal was far and away the most important mineral. The output in 1922 was 5,569,072 tons, valued at $24,629,921, and was distributed largely among the other maritime provinces. Gold continued to decline; the 1922 yield was only $21,540 as against $44,935 in 1913. Pig iron also showed decreases for the years following 1913. In all, in 1922, Nova Scotia's mineral products were valued at $25,923,499, almost 19 per cent of the total production; Ontario and British Columbia surpassed Nova Scotia. Of the 20 blast furnaces in Canada, 6 were located in Cape Breton and 2 in Nova Scotia. In 1921 there were 2196 industrial establishments (1480 in 1910) employing 17,206 workers and capitalized at $107,490,242 ($79,596,341 in 1910). The cost of materials was $43,919,126 and the gross value of products $84,215,822 ($52,706,184 in 1910). The following industries were important: manufacture of coke, iron and still products ($11,000,000 in 1922), shipbuilding, sugar refineries, boot and shoe works, etc.

Trade and Communications. Imports entered for consumption in 1922–23 were $23,878,615 ($20,753,369 in 1912–13); exports were $46,290,133 ($24,201,473 in 1912–13) In 1922 there were 1451 miles of railway as compared with 1360 in 1913. Some 18,000 miles of highways kept in good repair made intraprovincial communication easy This was further facilitated by the numerous subsidized boats which plied along the shore

Government. The suffrage was exercised by both sexes. Revenues in 1914 were $1,885,000; in 1922, $4,791,000. The Dominion subsidy continued to yield about $636,000. Other sources were royalties on coal lands and other provincial properties, succession duties, etc There was no direct taxation. Expenditures in 1913 and 1922 were $2,098,893 and $4,791,998. In the same period the debt grew from $12,615,686 to $22,616,000. For the year 1921–22, 114,229 pupils were enrolled at 2982 schools. Total cost of education was $3,646,570 as compared with $1,439,742 in 1913. The Province maintained a normal school and an agricultural school at Truro as well as the technical school at Halifax. The most important educational question of the period was the proposal to unite the six most important universities in the Maritime Provinces into a single centre. Representation in Parliament: House of Commons, 16; Senate, 10.

NUTS. See Horticulture

NYASALAND PROTECTORATE. A British protectorate in southeastern Africa on the southern and western shores of Lake Nyasa. Area, 39,573 square miles; population (1921), 1,199,934 natives; 1486 Europeans; 563 Asiatics. In 1911 there were 766 Europeans and 481 Asiatics. The chief settlement, Blantyre in the Shire Highlands, had some 300 Europeans. In the Shire Highlands coffee was being cultivated, as well as tobacco, cotton, and tea. The crops showing the greatest advances over the period 1910–22 were tobacco and tea, while cotton and coffee fell behind. Tobacco exports in 1912–13 totaled 2,262,545 pounds; 1922, 6,330,808. Leading imports were cotton piece goods, rice and grain, sugar, and petroleum. Imports in 1913–14 were £208,711; 1921, £637,567; 1922, £522,119 Exports in 1913–14 were £266,089; 1921, £416,404; 1922, £442,164. The trade does not include specie or goods in transit Of the exports, 99 per cent went to the United Kingdom; 55 per cent of the imports came from the United Kingdom and 20 per cent from British possessions. The following figures show the course of administrative charges· revenues for 1913–14 and for 1922, £124,849 and £259,117; expenditures for same years, £133,106 and £305,495. The large deficit in the later year was occasioned by the cost of famine relief measures. The public debt of the protectorate in 1922 was £306,328. To this must be added £3,000,000 borrowed from Great Britain to finance war campaigns in German East Africa. To bring the protectorate into ready communication with the Indian Ocean a railway from Chindio in Portuguese East Africa to Blantyre (174 miles) was constructed. In 1922 another line connecting Blantyre with Beira in Portuguese East Africa was opened. The extension of the railway system northward to Lake Nyasa, on which so much depended, was still only contemplated in 1923. The settlers were involved in the War because of the proximity of German East Africa. Most of the Europeans saw service as well as almost 200,000 natives in the rôle of carriers The natives continued orderly except for a single uprising in 1915 which was speedily quelled.

O

OAKLAND. The third city of California. The population increased 44 per cent in 10 years, from 150,174 in 1910 to 216,261 in 1920 and to 240,086 by estimate of the Bureau of the Census for 1923. A $5,000,000 bond issue was authorized by the voters in 1919 to be used in building three high schools and six junior high schools Oakland joined with several neighboring cities in 1923 to purchase the East Bay Water Company and develop new sources of supply for the district. In the same year the city purchased a site on the shore of Lake Merritt on which to build a museum. Plans were under way in 1924 for spending $8,000,000 in developing the water front. Building permits increased 396 per cent from $5,817,905 in 1918 to $27,500,000 in 1923, bank clearings 110 per cent, from $335,334,421 to $803,797,523, and the assessed valuation of the city 28 per cent, from $150,000,000 to $192,221 000.

OATS. Among the cereal crops in the United States oats is exceeded only by corn and wheat in acreage and value. The average annual production for the years 1914 to 1923, inclusive, was 1,334,675,000 bushels and, similarly, the annual production for the three leading States was 206,240,000 bushels for Iowa, 159,445,000 bushels for Illinois, and 119,212,000 bushels for Minnesota. During the World War there was a general increase in acreage and production in the United States, while in Europe the crop decreased and for a number of years did not regain its normal status The United States Grain Standards Act required oats in inter-State commerce to be inspected by a licensed inspector and graded by him on the basis of official standards. According to these standards, effective since June 16, 1919, oats are classified for commercial purposes as white (including yellow), red, gray, and black oats. Each class is divided into four grades on the basis of condition and general appearance, test weight per bushel, sound oats, heat damage, wild oats, and mixtures of other classes of oats. In addition, there is a "sample grade" for oats too poor to come within the numerical grades. For the three years ending June 30, 1922, about 53 per cent of all classes fell into grade three and about 28 per cent into grade two. Consult *United States Department of Agrioulture Year Book*, 1922.

OBER, MARGARETE (1885–). A German dramatic mezzo-soprano, born in Berlin. She studied there with Benno Stolzenberg and, later, Arthur Arndt, whom she married in 1910. After her début at Frankfort in 1906, as Azucena, she was engaged at the Stadttheater in Stettin, where her extraordinary voice and superior talent as an actress attracted the attention of Von Hülsen, who in 1907 engaged her for the Royal Opera in Berlin. Her American début as Ortrud at the Metropolitan Opera House (Nov. 21, 1913) was one of the sensations of the season. From 1913 to 1917 she divided her time between New York in the winter and Berlin in the summer and sang as guest in other principal German opera houses and in Amsterdam When the Royal Opera became the Staatsoper in 1919, she was retained as one of the principal stars. Her interpretation of the great Wagner rôles and of the German Lieder is considered unexcelled.

OBERLIN COLLEGE. A nonsectarian, coeducational institution at Oberlin, Ohio, founded in 1833. There was only a slight variation in the enrollment of students during the decade 1914–24, since the college limited the attendance of students to the number that it could efficiently care for with its classrooms, laboratories, and dormitories. In 1922–23, the total enrollment was 1801. The faculty increased from 157 in 1913–14 to 185 in 1923–24 The library, which was said to be the largest college library in Ohio, numbered 241,000 bound volumes and 178,000 pamphlets New buildings erected during the 10 years included an art building in memory of Dr. Dudley P. Allen, given by Mrs. Allen, and an administration building erected in memory of Gen Jacob Dolson Cox. In November 1923, Oberlin entered upon a campaign for $4,500,000 for new endowment and buildings. By Jan 1, 1924, gifts and pledges were received for $3,000,000, and it was expected that the remainder of the fund would be secured before the end of 1924 The largest contribution was the gift of $500,000 by the General Education Board. Work was to begin in the spring of 1924 on a new college hospital. President, Henry Churchill King.

OBREGÓN, ALVARO (1880–). A president of Mexico, born in the District of Alamos For many years he was engaged in scientific farming and stock-raising on his large estates. He was an advocate of economic reforms, including the better education of Indians In 1912 he began his military career by recruiting a force of Indians to assist President Madero. He manifested unusual military talent in this brief campaign. He was appointed colonel of the Sonora state militia, and after Diaz's military revolt in Mexico City he offered his force to the government of Sonora and was sent to Nogales, where he routed the garrison. Following a victory at Cananea he was made general of the division by Governor Carranza of Coahuila. After many victories, he captured Guadalajara on July 9, 1914, and entered Mexico City as a victor in the following August. In 1915 Obregon defeated Zapata in Pueblo and again occupied Mexico City. His most important victory was over Villa in Celaya, in April. In this battle he lost an arm. In 1920 he entered a successful revolt against Carranza and in the same year was elected president of the republic. For his negotiations with the United States in 1923–24 and for other events of his administration in Mexico, see MEXICO.

O'BRIEN, EDWARD JOSEPH HARRINGTON (1890–). An American author and editor, born at Boston, Mass. He studied at Boston College and at Harvard and from 1912 to 1915 was editor of *The Poetry Journal.* In the year following he was editor of *Poet Lore.* He wrote *The Flowing of the Tide,* a play (1910); *White Fountains,* verse (1917); *The Bloody Fool* (1917); *Distant Music* (1921); and *Hard Sayings* (1922). He edited *The World's History at a Glance* (1913); *Poems of the Irish Revolutionary Brotherhood* (1917); and from 1915 edited annually *The Best Short Stories* and *The Best English Stories.* He also translated several books from the French and other languages.

O'BRIEN, FREDERICK (1869–). An American writer, born in Baltimore, Md., and educated at the Jesuit College in Baltimore and the University of Maryland. At the age of 18 he went to sea and for many years thereafter traveled extensively. He was at various times connected with newspapers in New York, San Francisco, Manila, and Paris. During the War he was acting food administrator of California and chief of education As a result of a sojourn in the islands of the South Seas, he wrote *White Shadows in the South Seas* (1919) This was immensely successful and was followed by *Mystic Isles of the South Seas* (1921) and *Atolls of the Sun* (1922)

OBSTETRICS. See ABORTION.

OCCIDENTAL COLLEGE. An institution at Los Angeles, Cal., founded in 1887 under Presbyterian auspices. The number of students increased from 311 in 1915 to 522 in 1923, the faculty from 25 to 47 members, the endowment from $161,027 to $363,722, and the annual income from $49,782 to $129,961. The Graduate School and the School of Education were founded in 1922. The women's gymnasium and the president's house were built in 1922; the library, an anonymous gift in memory of Mrs. Mary Norton Clapp, was completed in March, 1924, at a cost of $150,000; plans were in preparation for the building of Orr Court, a women's building and residence court, the gift of William Mead Orr in memory of Bertha Harton Orr A campaign for $500,000 was completed in 1924, oversubscribed by $150,000. President, Remsen D. Bird, D.D.

OCEAN NAVIGATION. See SHIPPING; SHIPBUILDING; NAVIGATION.

OCEANOGRAPHY. See EXPLORATION.

OCHSNER, ALBERT JOHN (1858–1925). (see VOL. XVII). In 1916 he wrote the surgical section of Smithies's *Cancer of the Stomach,* and in 1917, assisted by Percy, he brought out a new edition of his work, *A New Clinical Surgery,* with the title *A New Manual of Surgery, Clinical and Military.* A large four-volume system of surgery edited by Ochsner, *Surgical Diagnosis and Treatment by American Authors,* was published in 1920. During the War he was a major of the Medical Reserve Corps

O'CONNOR, ANDREW (1874–). An American sculptor (see VOL. XVII). His recent important works include a fine "Soldier" Worcester, Mass.; "Serenity," part of the monument to General Thomas, Tarrytown, N. Y.; "Inspiration," St. Louis Museum, and especially a bronze Lincoln (Springfield, Ill.), which has caused much discussion.

OFFICERS' TRAINING CAMPS. See ARMIES AND ARMY ORGANIZATION.

OGG, FREDERIC AUSTIN (1878–). An American educator, born at Solsberry, Ind., and educated at DePauw, Harvard, and Indiana Universities. From 1905 to 1913 he was a member of the faculty of the Boston University and Simmons College. In the latter year he was appointed associate professor at the University of Wisconsin, where from 1917 he was professor of political science. He wrote *The Opening of the Mississippi—A Struggle for Supremacy in the American Interior* (1904); *Social Progress in Contemporary Europe* (1912); *Life of Daniel Webster* (1914); *Economic Development of Modern Europe* (1917); *The Old Northwest and Reign of Andrew Jackson* (in *Chronicles of America,* vols. xix and xx; 1919); *National Governments and the World War,* with C. A. Beard (1919); and *Introduction to American Government,* with P. O. Ray (1921) He was editor of *The Century Political Science Series*

O'HIGGINS, HARVEY J. (1876–). An American writer, born in London, Ont., and educated at the University of Toronto. He began his career as a writer by the publication of *The Smoke Eaters* (1905). This was followed by *A Grand Army Man* (1908); *The Beast and the Jungle,* with Judge Ben B. Lindsey (1910); *Polygamy* (1914); *From the Life* (1919); *The Doughboy's Religion,* with Judge Lindsey (1919); *Secret Springs* (1920); *Some Distinguished Americans* (1922); and *The American Mind in Action* (1924) He also wrote several plays with Harriet Ford. Some of these were successfully produced.

OHIO. Ohio is the thirty-fifth State in size (41,040 square miles) and the fourth in population; capital, Columbus. The population increased from 4,767,121 in 1910 to 5,759,394 in 1920, a gain of 20.8 per cent. The white population increased from 4,654,897 to 5,571,893; negro, from 111,452 to 186 187; native white, from 4,057,652 to 4,893,196; and foreign-born white, from 597,245 to 678,697. The urban population rose during the decade from 2,665,143 to 3,677,136; the rural population, on the other hand, fell from 2,101,978 to 2,082,258. The growth of the principal cities was as follows: Cleveland, from 560,663 in 1910 to 796,841 in 1920; Cincinnati, 363,591 to 401,247; Toledo, 168,497 to 243,164; Columbus, 181,511 to 237,-031; Akron, 69,061 to 208,435 (see articles on these cities)

Agriculture. As Ohio is an important grain-growing State, agricultural conditions in the decade 1910–20 were affected by the fluctuations in production and prices of grain during the War and post-war period. The general agricultural history of the period is treated under AGRICULTURE, CORN, BARLEY, WHEAT, etc. Agriculture in most of its phases showed a decline in the State during the decade. While the population increased 20 8 per cent, from 1910 to 1920, the rural population decreased from 51.9 per cent in 1900 and 44.1 per cent in 1915 to 36.2 per cent in 1920. The number of farms decreased 5 6 per cent (from 270,045 in 1910 to 256,695 in 1920); the acreage of land in farms, from 24,105,708 to 23,515,888, or 2.4 per cent, and the improved land in farms, from 19,277,969 acres to 18,542,353, or 3.6 per cent. The percentage of total area in farms decreased from 92.5 in 1910 to 90.2 in 1920; the percentage of land improved from 73.7 to 71.1. Farm land value increased in the decade largely as a result of war prices for farm products. The total

value of farm property rose from $1,902,694,589 in 1910 to $3,095,666,336 in 1920 or 62.7 per cent; the average value per farm from $6994 to $12,060. In interpreting these values and all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920 Of the total of 256,695 farms in 1920, 177,986 were operated by owners, 3065 by managers, and 75,644 by tenants The comparative figures for 1910 were 192,104, 2753, and 77,188 White farmers in 1920 numbered 255,079; colored farmers, 1616 In 1910, white farmers numbered 270,095, and colored farmers, 1950 Farms free from mortgage in 1920 numbered 110,004; those under mortgage, 50,784 In 1910, farms free from mortgage numbered 135,616, those under mortgage, 54,997 The total number of cattle in 1920 was 1,926,823, of which 1,349,373 were dairy cattle. In 1910 the cattle numbered 1,837,607 (dairy cattle, 905,125) Sheep in 1920 numbered 2,102,550, compared with 3,909,162 in 1910; hogs, 3,083,846, compared with 3,105,627. The estimated production of the principal farm crops in 1923 was as follows: corn, 177,794,000 bushels; spring wheat, 465,000 bushels, winter wheat, 42,588,000 bushels; oats, 55,078,000 bushels; rye, 1,302,000 bushels; barley, 2,076,000 bushels; potatoes, 11,533,000 bushels; sweet potatoes, 335,000 bushels; hay, 3,557,000 tons; tobacco, 42,770,000 pounds; and sugar beets, 385,000 short tons Comparative figures for 1913 are: corn, 146,250,000 bushels; wheat, 35,100,000; oats, 54,360,000; rye, 1,600,000; barley, 960,000; potatoes, 10,240,000; hay, 3,848,000 tons; and tobacco, 61,425,000 pounds

Mining. Ohio is one of the most important of the mineral-producing States. In point of value of products, it ranked sixth in 1921. Its chief products are coal, clay products, petroleum, and natural gas. The table gives figures on

MINERAL PRODUCTS IN OHIO

Year	Coal		Clay products	Petroleum	
	Net tons	Valued at	Valued at	Barrels	Valued at
1914	18,843 115	$21 250,642	$37,166 768	8,536,352	$13 372,729
1915	22,434,691	24,207,075		7,825,326	10,061 493
1916	34,728,219	46,150,907	44,947,877	7,744,511	16,154,940
1917	40,748,734	100,897,148		7,750,540	21,101,483
1918	45,812,943	118 095 548	52 899 180	7,285,005	23,465,197
1920	45,878,191	175 081,000	82,061,960	7,400,000	37,338,000
1921	31,942,776	84,686,500	67,396,680	7,335,000	21,512,000
1922	26,953,791			6,781,000	

facturing establishments in 1909; 15,658 in 1914; and 16,125 in 1919. Persons engaged in manufacture numbered 523,004, 606,807, and 882,918; and the capital invested amounted to $1,300,732,732, $1,677,551,663, and $3,748,743,996 in those years. The value of products was $1,437,935,817 in 1909; $1,782,808,279 in 1914; and $5,100,308,728 in 1919. The large increase in value of products was due largely to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the census period 1915–19, but the increase in number of establishments and in number of wage earners clearly indicates decided growth in the manufacturing activities of the State. The most important industry in point of value of product is iron and steel, in 1909 amounting to $197,780,000; 1914, $205,023,000; and in 1919, $626,370,000. Foundry and machine-shop products rank second in point of value: in 1909, $145,837,000; in 1914, $178,855,000, and in 1919, $572,079,000 In third place is the manufacture of rubber tires and rubber goods, in 1909 valued at $53,911,000; in 1914, $109,659,000; and in 1919, $551,118,000. The manufacture of automobiles, bodies and parts, ranking fourth, had a product valued at $38,839,000 in 1909; $85,711,000 in 1914, and $379,436,000 in 1919. The principal manufacturing cities of the State are Cleveland, Akron, Cincinnati, and Toledo. In Cleveland, there were 2148 manufacturing establishments in 1909, with a product valued at $271,961,000, 2345 in 1914, with $352,418,000; and 2946 in 1919, with $1,091,577,000. In Cincinnati, there were 2183 in 1909, with $192,516,000; 2135 in 1914, with $210,860,000; and 2239 in 1919, with $500,041,000 Akron had 246 manufacturing establishments in 1909, with a product of $73,158,000; 305 in 1914, with $122,292,000; and 304 in 1919, with $558,962,000. Similar figures for Toledo were: 760 in 1909, with $61,230,000; 713 in 1914, with $115,049,000; and 671 in 1919, with $293,521,000 Other important manufacturing cities are Columbus, Dayton, Canton, Springfield, and Youngstown.

the first three. The diminished output of coal in the latter two years was due largely to the long strike that occurred in 1921 and affected the entire mid-Western field. In addition to these three minerals, the State produces large quantities of natural gas, natural-gas gasoline, sand and gravel, and stone The total value of the mineral products in 1921 was $223,533,658, compared with $355,844,499 in 1920; $214,829,888 in 1919; $246,162,215 in 1918; and $101,661,384 in 1914.

Manufactures. Ohio is one of the most important States industrially In 1920, there were 50 cities having more than 10,000 inhabitants, and forming 54.5 per cent of the total population of the State. These cities, in 1919, reported 79 6 per cent of the State's manufactured products. There were in the State 15,138 manu-

Education. The greatest advancements in education in Ohio after 1913 were county school systems and trained teachers. There was no supervision of rural schools until 1914, when county boards of education were established These boards elect county superintendents of schools and, if necessary, assistants. Hundreds of centralized rural schools of the best type have been built under the new régime, most of which include high schools. No training was required of teachers prior to 1914, except by certain city boards of education The requirements were increased gradually; until the standard rose in 1921 to a full year of normal work, which is, in effect, a year beyond a four-year high school course. Two new State normal

schools were started in 1913; and a county normal school plan was adopted to supplement the other agencies for preparing elementary teachers. There are over 50 of these schools with work of strictly collegiate grade. Some of the private colleges, of which there are many in Ohio, also undertook to train elementary teachers, under the supervision of the State Department of Education. In 1924, all but two of the standard colleges prepared high school teachers with the large amount of professional training required by the 1914 law. High school supervision by the State university was merged with that of the State Department of Education. Most high schools rose to first grade rank. The compulsory education law of 1921 requires attendance to the age of 18 of those not through high school; those fitted may secure work certificates at 16. Other advances are: much improvement in day schools for blind, deaf and crippled; State and many county supervisors of music; moving picture censorship under State director of education; increase of director's salary from $4000 to $6500; establishment of Smith-Hughes vocational work, especially strong in part-time industrial education; a model teachers' retirement law; increase of State aid to weak school districts from about $200,000 to $2,400,000 with the administration entirely under the State director of education. The enrollment increased from 895,167 in 1914 to 1,180,641 in 1923. The average attendance increased from 720,442 in 1914 to 1,004,235 in 1923 Illiteracy in the State decreased from 4 per cent in 1910 to 3.6 in 1920; in the native white population, from 2.2 per cent to 1.2 per cent; among the foreign-born white, rose from 11.8 per cent to 13 4 per cent; and among the Negroes, fell from 13.9 per cent to 9.7 per cent.

Finance. For finance, see STATE FINANCES.

Political and Other Events. There were many important political events in the history of Ohio in the decade 1914–24. For the greater part of the period the Republican party remained in control, but during a portion of the time, the Democrats developed sufficient strength to elect candidates for office and to control the Legislature. Elections were held in 1914 for State officers and United States Senator. Warren G. Harding, former lieutenant-governor, was nominated by the Republicans for the Senatorship, and Timothy S. Hogan by the Democrats. For governor, the Republicans nominated Frank B. Willis and the Democrats James M Cox. Willis was elected governor, and Harding, Senator. While the Republicans carried practically the entire State ticket, an amendment establishing county local option was carried in this election, while amendments providing for woman suffrage and prohibition were defeated. In April of this year the coal mines of the State were shut down as the result of the failure to negotiate an agreement as to payment between employers and employees. The strike continued during the year, involving great suffering to the miners and huge losses to the industry. In 1915 a constitutional amendment forbidding the sale of intoxicating liquors was submitted to the people and was rejected. Severe floods in the State, in July of this year, resulted in the death of five and damage of more than $2,000,000,000. In 1916 the Republicans renominated Governor Willis, while the Democratic nominee was James M. Cox. The Democrats renominated Senator Pomerene; the Republicans, Myron T. Herrick. The entire State Democratic ticket was elected, and Senator Pomerene was reëlected. In the presidential voting of this year, President Wilson received 604,161 votes; Charles E. Hughes, 514,753. During this year there were serious labor troubles in the State, and riots in East Youngstown among the steel workers resulted in great damage to property and the destruction of practically the entire business section by fire. In 1917 the people defeated a law permitting women to vote for presidential electors. In the same election a prohibition amendment was rejected. Governor Cox was renominated by the Democrats in 1918 and was reëlected. A State-wide prohibition amendment was adopted at this election. The Republicans were again successful in the State campaign in 1920, electing their candidate for governor, Harry L. Davis, while Frank L. Willis was elected to the Senate. In this year both candidates for President were natives of Ohio. In the presidential vote, Warren G. Harding received 1,182,022 votes; James M Cox, 780,037. In 1921, at a special election, the people of the State ratified a soldiers' bonus of $25,000,000. In 1922 the Republicans nominated for governor Carmi A. Thompson, while the Democratic nominee was A. V. Donahey. For United States Senator the Republican candidate was Simeon D. Fess, member of Congress. The Democrats renominated Senator Pomerene. Donahey was elected governor, and Fess, Senator. At this election the constitutional amendment providing for the sale of beer and light wines was proposed for submission. The Secretary of State refused to certify the amendment for a vote on the ground that even if adopted, it would be without effect. The Supreme Court ordered him to place the proposal on the ballot. It was rejected by the people by a majority of over 180,000 votes. In 1923 the people rejected, on November 6, an old-age pension proposal and approved an amendment relieving employers from liability in private suits where covered by the State workmen's compensation insurance. On June 28, 1924, the city of Lorain and others west of it were swept by a tornado which did damage of more than $50,000,000 and took 94 lives, 71 of them in Lorain. Most of the business district of Lorain was devastated.

Legislation. Among the important acts of the Legislature in the decade 1914–24 were the following. Two special sessions were held in 1914. An act was passed reorganizing the agricultural interests of the State and creating an agricultural commission. The common school system was also reorganized. In 1917 the Legislature was under Democratic control. A law was passed permitting women to vote for president. This, as noted above, was defeated by the people. The Federal prohibition amendment was ratified by the Legislature on Jan. 7, 1917, but on November 4 of that year, the amendment was rejected by the people by a majority of 542. On Jan. 6, 1919, the Legislature ratified the Federal woman suffrage amendment. At this session of the Legislature, statutes were passed defining and punishing criminal syndicalism and sabotage. The teaching of German in the elementary grades of public and parochial schools was forbidden. A new State highway act was passed. The Legislature of 1921 amended the compulsory education laws; made provision for coöperative marketing; passed

measures for the enforcement of the prohibition law, and amended the laws relating to the finances of the State. The Legislature in 1923 created a judicial council of nine judges and passed an old-age pension proposal, which was on Nov. 6, 1923, rejected by the people.

OHIO STATE UNIVERSITY. A coeducational institution at Columbus, Ohio, founded in 1870 and supported by appropriations from the State and Federal governments. The enrollment of the university more than doubled between 1914 and 1923–24, increasing from 4466 in the former year to 9875 in the latter. In the same period the faculty increased from 423 to 718 members, the library from 138,101 to 238,154 volumes, and the income from $1,276,134 to $4,499,577 68. The campus and university farm covered 880 acres. The university consisted in 1924 of 10 colleges and the Graduate School. In 1914, the Sterling Ohio Medical College, including the dental school, was incorporated as part of the university. The College of Commerce and Journalism was added in 1916. In 1922 and 1923–24, many new buildings were erected, including Mack Hall, a new residence hall for women; Pomerene Hall, a women's gymnasium; the Ohio Stadium; the new administration building; the new commerce building; the new journalism building; new chemistry laboratories; Hamilton Hall, the new medical science building; and an art studio New structures also were erected for beef cattle, dairy cattle, hogs and sheep. About $200,000 was expended on enlarging the power plant. Contracts were to be let in 1923–24 for a new university hospital and addition to medical science building to cost more than $750,000. The sum of $50,000 was appropriated for a residence for the president of the university, to be erected on the campus. During this period the university began to operate on the four-quarter system, abandoning the semester plan. The quarters were 12 weeks in length. The schedule was so arranged that a student might enter at the beginning of any quarter. Gifts to the university included $17,000 from Charles Cutler Sharp for the establishment of the Sharp Library Fund for purchase of books for the department of chemistry. President, W. O. Thompson, D.D., LL.D.

OHIO WESLEYAN UNIVERSITY. A coeducational institution at Delaware, Ohio, founded in 1844. The student enrollment increased from 1126 in 1914 to 1797 in 1923–24, the faculty was increased in membership from 66 to 126, and the library from 66,210 to 95,061 volumes. During the decade, departments of education, home economics, business administration, and religious education were founded. Austin Hall was built and the new Perkins observatory was begun. The Z. T. White building, in the heart of Columbus, valued at approximately $1,000,000, was bequeathed to the university by Mr. White in 1922, and $250,000 was given for the purchase and maintenance of a 61-inch reflecting telescope In the same year, the university began a campaign to raise $8,000,000 to add to the endowment and provide funds for 16 new buildings. John Washington Hoffman, D.D., LL.D., succeeded Herbert Welch, D.D., as president in 1916.

OKLAHOMA. Oklahoma is the seventeenth State in size (70,057 square miles) and the twenty-first in population; capital, Oklahoma City. The population increased from 1,657,155 in 1910 to 2,028,283 in 1920, a gain of 22.4 per cent. The white population increased from 1,444,531 to 1,821,194; the Negro, from 137,612 to 149,408; and the native white, from 1,404,447 to 1,781,226. The Indian population decreased from 74,825 to 57,337; and from 40,084 to 39,968. Both the urban and rural populations increased; the former from 320,155 to 539,480; the latter from 1,337,000 to 1,488,803. The growth of the principal cities was as follows: Oklahoma City (q.v.), from 64,205 in 1910 to 91,295 in 1920; Tulsa (q.v.), 18,182 to 72,075; Muskogee, 25,278 to 30,277.

Agriculture. As Oklahoma is an important grain-producing State, agricultural conditions during the decade 1910–20 reflected the fluctuations of price and production which characterized war and post-war conditions. The general situation is discussed under AGRICULTURE, CORN, WHEAT, etc. Oklahoma is an important producer of cotton, and though not affected as much as some of the other cotton-producing States by the ravages of the boll weevil, which vary in intensity with the season, the damage and uncertainty were considerable in some years. The fluctuations of the cotton crop in the decade are indicated by the following figures: 1913, acreage, 3,009,000, production 840,000 bales; 1916, 2,562,000, and 823,000; 1920, 2,749,000, and 1,336,000; 1921, 2,206,000, and 481,000; 1922, 2,951,000, and 635,000. The estimated production for 1923 was 945,000 bales.

While the population of the State increased 22.4 per cent during the decade, the number of farms increased only 0.9 per cent (from 190,192 in 1910 to 191,988 in 1920). The total area of land in farms, however, increased from 28,859,353 acres to 31,951,934, or 10.7 per cent; and the improved land in farms, from 17,551,337 to 18,125,321 acres, or 3.3 per cent. The percentage of the total area in farm land increased from 65 in 1910 to 71.9 in 1920; the percentage of land improved from 39 5 to 40.8. The total value of farm property showed an apparent increase, from $918,198,882 to $1,660,423,544, or 80.8 per cent; the average value per farm, from $4828 to $8649. Of the total of 191,988 farms in 1920, 93,217 were operated by owners, 935 by managers, and 97,836 by tenants. The corresponding figures for 1910 were 85,404; 651, and 104,137. White farmers numbered 173,263 in 1920 and 169,521 in 1910. Colored farmers numbered 18,725 in 1920; 20,671 in 1910. Farms free from mortgage in 1920 numbered 30,551; those under mortgage, 47,025. In 1910, unmortgaged farms numbered 46,889; those under mortgage, 36,036. The total number of cattle in 1920 was 2,073,945, of which 808,459 were dairy cattle. In 1910, cattle numbered 1,953,560; dairy cattle, 530,796. Sheep in 1920 numbered 105,370; in 1910, 62,472. The number of hogs decreased notably from 1,839,030 to 1,304,094; owing to high prices for grain during the War, wheat being planted instead of corn. The estimated production of the principal farm crops in 1923 was as follows: corn, 39,491,000 bushels; wheat, 36,300,000 bush-

els; oats, 22,522,000 bushels; barley, 2,557,000 bushels; grain sorghum, 18,276,000 bushels; potatoes, 2,381,000 bushels; sweet potatoes, 1,880,000 bushels; hay, 935,000 tons. Comparative figures for 1913 are: corn, 52,250,000 bushels: wheat, 17,500,000; oats, 18.540,000; barley, 63,000; potatoes, 1,920,000; and hay, 382,000 tons.

Mining. Oklahoma, although it produces no metals, ranks fourth among the States in value of mineral production. This is due chiefly to the development of the petroleum fields in the State during the decade 1914–24. The production of petroleum, in 1914 was 73,631,724 barrels; (1915) 97,915,243; (1916) 107,071,715; (1917) 107,507,471; (1918) 103,347,070; (1920) 106,206,000; (1921) 114,634,000; (1922) 149,571,000. The production of natural gas kept pace with the development of the petroleum fields, the production in 1914 being 78,167,414 thousand cubic feet; 123,517,358 (1916); 124,317,179 (1918); 154,467,200 (1920); 124,058,000 (1921). The production of natural-gas gasoline became extremely important in the last few years; 178,856,929 gallons were produced in 1920 and 185,340,742 gallons in 1921. The coal production is about 4,000,000 tons annually; it was 3,988,613 tons in 1914; 4,813,447 in 1918, and 2,802,511 in 1922. In addition to the minerals mentioned, the State produces cement, gypsum, lead, sand and gravel, and stone. The total value of the mineral production of the State in 1921 was $269,882,786, compared with $493,320,359 in 1920; $291,078,174 in 1919; $336,857,921 in 1918; and $78,744,447 in 1914.

Manufactures. Oklahoma is not one of the leading industrial States, but its manufacturing activities have shown great increase in value of products and in number of persons employed in recent years. In 1920, there were 12 cities with 10,000 inhabitants or more, which contained 15 6 per cent of the total population of the State, and in 1919 reported 33.3 per cent of the value of the State's manufactured products. There were in the State 2310 manufacturing establishments in 1909; 2518 in 1914; and 2445 in 1919. Persons engaged in manufacture numbered 18,034, 22,700 and 38,314; and the capital invested amounted to $38,872,938, $65,477,654, and $277,034,318, in those years The value of manufactured products in 1909 was $53,682,405; in 1914, $102,005,693; and in 1919, $401,362,869. The large increase in value of products from 1914 to 1919, was chiefly due to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period; but the increase in number of wage earners clearly indicates growth in the manufacturing activities of the State. Petroleum-refining is the most important industry in point of value of product. This amounted to $1,055,000 in 1909; $13,014,000 in 1914; and $150,673,000 in 1919. Flourmill and gristmill products rank second in this respect, with a value, in 1909, of $19,144,000; 1914, $16,689,000; and 1919, $49,844,000. The smelting and refining of zinc, in third place, had a product, in 1909, valued at $3,002,000; 1914, $9,939,000; and 1919, $19,518,000 The manufacture of cottonseed oil and cake was fourth: valued in 1909 at $5,187,000; in 1914, $7,590,000; and in 1919, $18,907,000. The chief manufacturing cities are **Oklahoma City and Tulsa.** In Oklahoma City, there were 171 manufacturing establishments in 1909, with a product valued at $7868; 195 in 1914, with $20,726,000; and 227 in 1919, with $69,971,000. Tulsa had 53 establishments in 1909, with a product valued at $1563; 103 in 1914, with $3,868,000; and 135 in 1919, with $14,050,000. Other important manufacturing cities are Enid, Muskogee, Guthrie, and McAlester.

Education. Satisfactory progress was made in education in the decade 1914–24. The period witnessed a remarkable growth in the wealth and population of the State, which made possible better schools The average length of the school term was considerably increased during the decade, and additional teachers were employed. The normal school facilities, which had always been insufficient, were increased by the provision for normal training in certain selected high schools. There was a large increase in the number of schools offering high-school courses, and high-school opportunities to rural children were greatly extended by the organization of graded and consolidated districts. A large colored and Indian population greatly increased the educational difficulties of the State. The enrollment in the public schools increased from 496,908 in 1914 to 609,767 in 1921 The enrollment in white rural schools in 1920 was 544,821, and in colored rural schools, 44,461. In elementary rural schools for white pupils there were enrolled 517,317 in 1921; in white high schools, 47,893, in Negro elementary schools 42,938; and in Negro high schools, 1619. The expenditures for schools in 1921 was $28,368,688. The total enrollment in the graded schools for 1923 was 637,299; and the school expenditure in that year was $30,479,355. The percentage of illiteracy in the State decreased from 6.9 in 1910 to 4 7 in 1920: in the native white population, from 4.2 to 2 9 per cent; rose in foreign-born white, from 9.7 to 13 4; fell in negro, from 22 7 to 16.4.

Finance. For finance, see STATE FINANCES.

Political and Other Events. During the decade 1914–24 the State continued to be Democratic in politics. At elections held for governor and United States Senator in 1914, Senator Gore was reëlected, and R. L. Williams, the Democratic candidate, was elected governor. The Democrats also elected Representatives to Congress in all districts except one. On Jan. 21, 1915, the United States Supreme Court declared unconstitutional the so-called "grandfather clause" to the constitution, which disfranchised a large percentage of the negroes of the State. There was no election for State officers in 1916. In the presidential voting of this year President Wilson received 148,626 votes; Charles E. Hughes, 98,299. In 1918 Senator Owen was renominated by the Democrats, and Judge J. B. A. Robertson received the Democratic nomination for governor. Both were elected in November. Elections were held in 1920 for United States Senator John W. Harrold, Republican, defeated Scott Ferris, Democratic nominee, by a large majority. In the presidential voting of this year, W. G. Harding received 243,415 votes; J. M Cox, 215,521. An attempt was made in April, 1921, to impeach Gov. J. B. A. Robertson. This failed in the Legislature. On Mar. 22, 1922, Governor Robertson was arrested for bribery in connection with the insolvency of the Guarantee State Bank of Okmulgee. In the State election of 1922, J. C. Walton, Democratic candidate, was

elected governor. Alice Robertson, a Representative to Congress in 1920, was renominated by the Republicans, but was defeated. In the summer of 1923, as a result of alleged outrages by the Ku Klux Klan, Governor Walton placed the State under martial law. The Legislature denied his right to do this and wished to hold a special session in order to impeach him. Governor Walton denied their right to meet, and the members of the Legislature circulated a petition among themselves for a special session. The Adjutant-general of the State was ordered by the Governor to prevent their meeting, but the legislators entered the Capitol without hindrance, although they were prevented from assembling by an officer of the National Guard. An injunction was thereupon obtained preventing the National Guard from interfering. Previous to these events, Governor Walton had called a special election to pass on proposed amendments to the State constitution. One of these would permit the Legislature to assemble without the Governor's consent on a call of a majority of its members. The Attorney General attempted to have ballots for this measure cast by the Supreme Court, but the petition was denied. The Governor thereupon ordered out the National Guard to prevent the election. The local boards ordered the ballots printed, and citizens were urged to vote in spite of the Governor's proclamation to the contrary. At the special election the amendment was passed. Governor Walton then ordered the Legislature to meet but specified that it should devote its attention exclusively to the Ku Klux Klan. On assembling, the House at once began preparations for impeaching Governor Walton, and charges were filed with the Senate acting as a court of impeachment. The Legislature also passed a resolution for the investigation of the Ku Klux Klan, but the motion to expel members of the Klan from the House was defeated. In November, Governor Walton was found guilty on 11 counts, including charges that he had padded the State payroll, prevented the assembling of the Grand Jury, attempted to prevent a special State election, exceeded the legal limit of election expenses, and was generally incompetent. The Governor presented no defense. He was succeeded by the Lieutenant-Governor.

Legislation. Among the important acts of the Legislature in the decade 1914–24 were the following. A budget system was created by the Legislature of 1919. At this session also measures were passed defining and punishing criminal syndicalism and sabotage. In 1923 the Legislature passed a measure providing for industrial rehabilitation and farm or home aid for veterans of the War. A measure was also passed making robbery or its attempt punishable by a minimum of 25 years in prison. The Legislature also passed a bill prohibiting the Ku Klux Klan and members of other organizations from wearing masks in public.

OKLAHOMA, UNIVERSITY OF. A coeducational State institution at Norman, Okla., founded in 1892. The student enrollment was doubled in the decade between 1914 and 1923–24, from 1700 in the former year to 3401 in the latter. The faculty was increased in the same period from 135 to 203 and the library from 23,000 to 52,000 volumes. The income increased from $253,500 in 1916 to $1,020,000 in 1923–24. The School of Social Service was established and the department of manual training in the College of Engineering opened in 1917, special war courses were offered in 1918, and the School of Public and Private Business was organized in 1923 as a separate school with authority to grant the B.S. degree. Up to that time the B.A. degree with special certificate in public and private business had been conferred in the College of Arts and Sciences. An auditorium, a fine arts building, a library building, a geology building, a hospital and an armory were erected in 1920, and a women's building in the following year. Stratton D. Brooks was president during the period until 1923, when J. S. Buchanan became acting president.

OKLAHOMA CITY. The capital and commercial centre of Oklahoma. The population increased from 64,205 in 1910 to 91,295 in 1920, to 101,150 by estimate of the Bureau of the Census for 1923, and to 140,000 by local estimate in 1924. During the decade of 1914 to 1924, the city completed a $5,500,000 water system capable of supplying a much larger city, and a $1,000,000 power plant, and increased the value of its schools from $2,456,000 to $8,494,000. Bank clearings rose from $115,879,816 in 1914 to $1,165,341,665 in 1923.

OLD AGE PENSIONS, IN THE UNITED STATES. The United States adopted old age pensions very slowly. The proportion of aged persons in its population was considerably smaller than in some of the older countries; and its largely agricultural population did not show the evils of indigent old age so quickly as those of more thickly populated areas. Up to 1913, practically the only measures that had been taken to relieve the hardships of the old age of workmen were those of railroads and large industrial concerns, which provided for the retirement with pension of their own employees, usually at the age of 65. In most cases no contributions from the beneficiaries were required. The trade unions objected to this method of provision The employer admitted no legal claim to a pension and retained the right to withdraw the pension offer if an employee were guilty of misconduct, which discouraged strikes and tied the worker's hands. Old age insurance was offered by a very few trade unions and a few fraternal organizations. The pensioning of municipal, State and Federal employees, though growing, was still quite limited. Retirement funds for teachers, policemen, and firemen, however, were becoming common. Some provision for old age insurance through savings banks had been made in Massachusetts in 1907 and in Wisconsin in 1911. But the only comprehensive system was that of military and naval pensions; and in not one of the public measures was the lower-paid and most needy class of workers provided for.

Development in the decade 1914–24 continued for some time solely to affect public employees and workers in corporations. In 1915, the Winchester Arms Company installed a pension system affecting about 12,000 persons, and the Wells Fargo Express Company adopted a similar scheme in the following year. In 1920, Congress passed a comprehensive bill providing for the retirement of employees in the Civil Service, under which contributions by employees to the extent of 2½ per cent of their basic compensation, and retirement at 70 after 15 years of service, were compulsory, and old age and total disability pensions were granted in ratio to contribution and length of service. Beyond

the unsuccessful launching of an old age pension bill in Ohio in 1917, nothing had been accomplished up to this time in the way of old age pensions proper. But interest had by no means been dormant; in 1921–22 this gained impetus; labor organizations, church bodies, and industrial leaders took up the cry; in that year old age pension acts, of varying nature, were introduced in 15 State Legislatures and in Congress. Definite results came in 1923, when State laws for old age assistance were passed in Montana, Nevada, and Pennsylvania The Nevada law required that applicants be at least 60 years of age, citizens of the United States for at least 15 years, and residents of the State for at least 10 years The income of beneficiaries from pension and all other sources was not to exceed $1 per day. Inmates of prisons, workhouses, etc., were barred; also those who had been in prison for four months or more during the 10 years preceding, if such sentence were without the option of a fine; those who had within the preceding 10 years deserted spouse or failed to support children for six months, those who had children capable of and responsible for support; also those who owned property exceeding $3000. Where needed, a maximum funeral benefit of $100 was provided for Provisions were made for cases where claimant owns property. In the Pennsylvania act the pension age was 70, and the State residence requirement 15 years; in Montana, the pension age was 70 and the citizenship and State residence requirement 15 years; otherwise the provisions were essentially the same as those of the Nevada measure In Alaska, in 1923, the act of 1915 was amended to reduce the pension age from 65 to 60 for women, and increase the maximum monthly allowance from $12.50 for either sex to $25 for men and $45 for women: while the residence requirement was increased from 10 to 15 years. The growth of the movement was evident in other States, also. Old age pension bills, although they were not passed, became definite political issues in Ohio and Illinois; and Massachusetts and Indiana appointed commissions to study the subject. The desirability of a Federal system was beginning to be discussed, to prevent migration, and to equalize the burden that it might not bear too heavily on communities where the percentage of aged people was higher. Although so far the non contributory system appeared to be in favor, the compulsory-contributory type of protection was not without strong advocates who argued that this system was necessary to preserve the dignity of labor, to encourage thrift, and to conform to the principles of sound finance.

Other Countries. Expenditures for old age pensions increased as follows· in Denmark, from $2,643,125 in the fiscal year 1909–10, to $15,-959,400 in the fiscal year 1919–20; in Great Britain, from £8,468,128 in the fiscal year 1910–11, to £25,087,000 in 1920–21; in New Zealand, from £362,496 in 1910 to £731,343 in 1921; and in Australia (invalidity pensions included) from £1,868,648 in 1911 to £5,337,936 in 1923. This increase in aggregate expenditures during the decade was, however, largely due to increases in the pension rates to meet the reduced purchasing power of money. The percentage of persons assisted under pension laws likewise showed an increase in general. In Denmark, it rose from 2.4 in 1910 to 3.3 in 1920; in the latter year more than 34 per cent of the entire male population, and 48 per cent of the women, over 60 years of age, were pensioners. The number pensioned in Great Britain increased from 669,362 in 1910–11 to 1,029,307 in 1921–22. In 1915, of the entire population over 70, about 65 per cent were being thus supported. In New Zealand, however, the proportion of old age pensioners to total population, which was placed in 1910 at 1.8 per cent, fell to 1.6 per cent in 1920; and in Australia, while the proportion rose from 1.5 per cent in 1910 to 1.92 in 1921, there was a decline in 1923 to 1.91 per cent.

In 1919, Uruguay passed an old age pension law affecting all persons reaching the age of 60, and other entirely incapacitated and indigent, granting not less than 96 pesos or $99.28 annually, in cash or assistance, foreigners and naturalized citizens of 15 years' continuous residence being entitled to the benefits; the funds being drawn from increased taxes on employers, real estate, and on playing-cards and liquors. In England, the Old Age Pension Act of 1909, providing for weekly allowances of not more than 5 shillings to persons over 70 whose incomes were under $157 50 per year, was amended in 1916 to permit slightly increased allowances in needy cases, and in 1919 the allowance was raised to 10 shillings. The Act was latterly subject to much criticism. Although expenditures had risen rapidly, it was claimed that the allowance still was insufficient and that many who had left workhouses to accept pensions had returned. It was also said that the system was an incentive to fraud and improvidence in its existing form (although careful scrutiny of claims had brought the cost of administration almost to £1,000,000 annually), and an amendment to the law to give the pension to all citizens at the age of 70 regardless of means was proposed, but defeated, in 1923. France, in 1910, adopted a compulsory system of old age insurance which was expected practically to supersede the old age pension system, but this had not fulfilled expectations, and in 1924 measures to strengthen it were under consideration. Denmark raised the age limit for old age pensions from 60 to 65 years, in order to reduce expenditures. The old age pension systems of Australia (1916) and New Zealand (1898) seemed to be exempt from domestic criticism. The maximum annual allowances in those dominions were $162 and $130, respectively. Spain, in 1919, replaced its system of voluntary state-aided annuities with a compulsory insurance plan affecting all wage earners between 16 and 65 and in 1921 extended this to include all whose annual wage was less than 4000 pesetas ($772). In Italy, in 1920, the compulsory old age insurance act for seamen was replaced by one applying to practically all manual workers, salaried employees and professional classes. The temporary old age pension act passed in Belgium in 1920 was extended in 1923 for a further period of three years, a compulsory insurance law covering old age and death being meanwhile under consideration. In Germany, the compulsory old age and invalidity insurance law was amended in 1916, reducing the age limit from 75 to 65. The compulsory old age insurance law of Sweden, passed in 1913, was still the only law of universal application, affecting the entire population, from 16 to 67 years of age, with the exception of certain persons subject to state pensions.

OLMSTEAD, FREDERICK LAW (1870–). An American landscape architect (see VOL. XVII). From 1902 to 1917 he was landscape architect for the Baltimore Park Commission and from 1908 landscape architect for the Sage Foundation Homes Company He was professor of landscape architecture at Harvard University, 1903–14, and during 1910–19 he was a member of the National Commission of Fine Arts. He was chairman of the Executive Committee of the National Conference on City Planning from 1910 to 1919 and was governor of the American City Planning Institute. In 1917–18 he was a member of the Commission on Emergency Construction of the War Industries Board and during the same period manager of the town planning division of the United States Housing Corporation

OLYMPIC GAMES. The first Olympic Games since the War were held at Antwerp, Belgium, in 1920, the athletes of the United States repeating their triumph of 1912 at Stockholm, Sweden. In the track and field events the Americans scored more than double the number of points collected by their nearest competitor. The final standing of the various countries entered was: United States, 212 points; Finland, 105; Sweden, 95; England, 92; France, 35; Italy, 28; South Africa, 24; Canada, 10; Norway, 10; Denmark, 9; Esthonia, 8; New Zealand, 5; Belgium, 5; Australia, 5; Czecho-Slovakia, 3; Holland, 2; Luxemburg, 1.

Five new world's and three new Olympic records were made as follows: 400-meter hurdles, Loomis, U. S., 54 seconds (world); pole vault, Foss, United States, 13 feet, 5⅛ inches (world); 400-meter relay, U. S team, 42⅕ seconds (world); javelin throw, Myrra, Finland, 215 feet, 9¼ inches (world); 110-meter high hurdles, Thompson, Canada, 14⅘ seconds (world); throwing 56-pound weight, McDonald, U. S., 36 feet, 11½ inches (Olympic); running high jump, Landon, U. S., 6 feet, 4⅕ inches (Olympic); Marathon, Kolehmainen, Finland, 2 hours, 32 minutes, 35⅘ seconds (Olympic).

The United States also won a sweeping victory in the swimming events, chiefly because of the fine work of Duke Kahanamoku, Pua Kealoha and Warren Kealoha, all of the Hawaiian Islands. Great Britain captured the final water polo match from Belgium by a score of 3 to 2. In women's swimming the United States again showed marked superiority through the brilliant efforts of Ethelda Bleibtrey, Aileen Riggin and Frances Cowells-Schroth In rowing the United States Naval Academy won the eight-oared event; the American Kelly took the single sculls and Switzerland triumphed in the four-oared contest. The U. S. trap shooting team won, and Mark Arie of the United States carried off the individual championship. Canada won the hockey honors with the United States second. Great Britain was victor in the tennis competition, the United States being unrepresented because of the demands made upon the American players by the Davis Cup matches.

The first women's Olympic Games were held at Paris in 1922, the points being distributed among the various countries as follows: England, 50; United States, 31; France, 29; Czecho-Slovakia, 12; Switzerland, 6. In the 60-meter dash Mlle. B. Mejzlikova of Czecho-Slovakia set a new world's record of 7⅘ seconds. Miss Camelia of the United States also distinguished herself by running the 100-yard hurdles in 14⅖ seconds.

The Olympic Games of 1924, held at the Colombes Stadium, near Paris, France, attracted entries from forty-five nations, twenty-seven of which were medal winners The United States teams once more showed their supremacy, capturing the all-around championship through six months of keenest competition and carrying off the honors in track and field sports, rowing, swimming, tennis, Rugby, boxing, catch-as-catch-can wrestling, and rifle, pistol and target shooting.

In the track and field events the points were distributed among the various countries as follows: United States, 255; Finland, 166; Great Britain, 85½; Sweden, 31½; France, 26½; Italy, 19; Switzerland, 15; South Africa, 11; Hungary, 10½; Australia, 10; Canada, 8; Norway, 6; Argentina, 5; New Zealand, Holland and Esthonia, 4 each; Denmark, 3; Japan and Chile, 1 each.

The winners in the various events were: 10,000-meter run, Willie Ritola, Finland, 30 minutes, 23⅕ seconds (world's record); javelin throw, J. Myrra, Finland, 207 feet; 100-meter dash, H. Abrahams, Great Britain, 10⅘ seconds (equals Olympic record); 400-meter hurdles, F. M. Taylor, United States, 52⅖ seconds (world's record); high jump, H. M. Osborne, U. S., 6 feet, 6 inches (Olympic record); pentathlon, Lehtonen, Finland (in this contest Robert Le Gendre, U. S., set a world's record of 25 feet, 6 inches for the broad jump); 800-meter run, D. G. A. Lowe, Great Britain, 1 minute, 52⅘ seconds; broad jump, De Hart E. Hubbard, U. S., 24 feet, 6 inches; shot put, Clarence Houser, U. S., 49 feet, 2½ inches; 110-meter hurdles, D. Kinsey, U. S., 15 seconds; 200-meter dash, J. V. Scholz, U. S., 21⅗ seconds (equals Olympic record), 3000-meter steeplechase, Willie Ritola, Finland, 9 minutes, 33⅗ seconds (world's record); 1500-meter run, Paavo Nurmi, Finland, 3 minutes, 53⅗ seconds (Olympic record); 5000-meter run, Paavo Nurmi, Finland, 14 minutes, 31⅕ seconds (Olympic record); hammer throw, F. D. Tootell, U. S., 174 feet; pole vault, L. Barnes, U. S., 12 feet, 11½ inches; 400-meter run, E. H. Liddell, Great Britain, 47⅗ seconds (world's record); 10,000-meter cross country run, Paavo Nurmi, Finland team, 32 minutes, 54⅗ seconds; hop, step and jump, Winter, Australia, 50 feet, 11¼ inches (world's record); decathlon, H. M Osborne, U. S., 7,710 775 points (world's record); 400-meter relay, United States team, 41 seconds (world's record); discus throw, Clarence Houser, U. S., 46 meters, 15½ centimeters (Olympic record); 1600-meter relay, United States team, 3 minutes, 16 seconds (world's record); 3000-meter team race, Finland, 8 minutes, 32 seconds (Olympic record); 10,000-meter walk, U. Frigerio, Italy, 47 minutes, 49 seconds; marathon, Stenroos, Finland, 2 hours, 42 minutes, 22⅗ seconds.

The United States won an even more sweeping victory in the swimming competitions, scoring 217 points, Sweden being second with 58 and Great Britain third with 50. John Weissmuller, U. S., set new Olympic records in the 100-meter and 400-meter free style events for men. Miss Sybil Bauer, U. S., established a world's record in the 100-meter back stroke competition for women, and Miss Ethel Lackie, U. S., equaled the world's record in the 100-meter free style contest.

In tennis the United States also had a walkover, Vincent Richards winning the final of the men's singles from Henri Cochet of France, Miss Helen Wills capturing the women's singles from Miss Emilienne Vlasto of France, Richards and Francis T. Hunter taking the men's doubles and Miss Wills and Mrs. George W. Wightman triumphing in the women's doubles.

OMAHA. The largest city of Nebraska. The population rose from 156,231 in 1910 to 191,601 in 1920; to 208,025 by estimate of the Bureau of the Census for 1924, and to 217,329 by the school census for the same year. A comprehensive zoning ordinance was adopted in 1920. In the same year the Metropolitan Utilities District with plant valuation of $13,000,000 was organized, controlling the city-owned gas and water systems; 60 miles of water mains were laid in 1923 and three 50,000,000-gallon pumps were installed in the water plant. The paved streets increased from 209 miles in 1915 to 402 miles in 1924; of this, 76 miles were laid in 1922 and 1923. In the latter year a technical high school was built at a cost of $3,500,000, and a $750,000 high school was under construction in 1924. Omaha is an important packing center and in 1924 held second place among the livestock markets of the United States; 73 per cent of the 8,500,000 head of cattle, hogs, and sheep received here was consumed in the fourteen packing plants of the city

ONCKEN, HERMANN (1869–). A German historian and professor. He contributed largely to the war literature of his country Among his works are *Amerika und die Grossen Machte: Historisch-politische Aufsatze* (1914), *Deutschlands Weltkrieg und die Deutsch-Amerikaner* (1914); *Unsere Abrechnung mit England* (1915); *Wie Ehrt ein Volk Seine Grossen Manner?* (1915); *Das Alte und das neue Mitteleuropa* (1917); *Ueber den Zusammenhang von Innerer und Aeusserer Politik* (1918); *Weltgeschichte und Versailler Friede* (1921); *Die Utopie des Thomas Mores und das Machtproblem in der Staatslehre* (1921); *Staatsnation und Kulturnation* (1922); *Lassalle* (1922); *Die Historische Rhein-politik der Franzosen* (1922); and *Aus Rankes Fruhzeit* (1922).

O'NEILL, EUGENE (GLADSTONE) (1888–). An American playwright, born in New York City, the son of James O'Neill, a celebrated actor. He was educated at De La Salle Institute and Princeton (1906–07) and Harvard University (1914–15). In 1909 he went to San Francisco and thence to Central America on a gold prospecting venture. After 1914, devoting himself to playwriting, he produced *The Moon of the Caribbees and Other Plays of the Sea* (1919); *Beyond the Horizon*, a tragedy in six acts (1919); *Thirst and Other Plays* (1914); *Emperor Jones*, an extraordinary monologue depicting the psychology of fear; *Diff'rent* (1921); *The Straw* (1921); *Gold* (1921); *Anna Christie* (1922); *The First Man* and *The Hairy Ape* (1922); *The Fountain* (1923); *Welded*, and *All God's Chillun's Got Wings* (1924). He stands first among American dramatists; in his works lies the hope of a fine native drama. Some of his plays have been produced in Europe.

ONTARIO. A Canadian province, with an area of 407,262 square miles, of which 365,880 square miles are land area. Population in 1911, 2,527,292; in 1921, 2,933,662, or a gain of 16 per cent. In 1921, the rural population made up 41.8 per cent of the total as compared with 47.4 per cent in 1911. The male population numbered 1,481,890; females 1,451,772, in 1921. The leading cities, with their populations in 1921, were: Toronto, 521,893 (381,833 in 1911); Ottawa, the capital of Canada, 107,843 (87,062 in 1911); Hamilton, 114,151 (81,969 in 1911); London, 60,959 (46,300 in 1911).

Industry. While agriculture was the leading activity of the province, it was evident that by no means all its possibilities were yet exploited. Only 14,000,000 acres were under cultivation in 1923, and it was estimated that northern Ontario alone contained some 20,000,000 acres ready for the plow. Diversified farming, including dairying, was becoming the rule. In 1923, 10,296,961 acres were under field crops; the more important were hay and clover, 3,596,484 acres; oats, 2,967,417; wheat, 828,908; there were also considerable yields of barley, peas, corn, fodder corn, sugar beets, and other root crops. The total value was $220,748,900 ($196,220,000 in 1914). The growing attention accorded dairying and the meat industry was indicated in the increase of live stock. Cattle in 1922 numbered 2,838,087 and 2,601,086 in 1913; sheep in 1923 and in 1913 were 907,673 and 705,848. In 1922 there were 1053 creameries and factories which produced more than one-third of all Canada's butter, five-eighths of the total cheese production, and nine-tenths of the condensed and evaporated milk. The total value of these products was $53,542,605 (about $18,000,000 in 1910). Fruit culture, particularly apples, and the production of tobacco and sugar beets were rapidly spreading in the southern districts. In 1920, 20,114 acres were under tobacco; this fell to 8630 acres in 1923. Under sugar beets were 36,288 acres (22,450 acres in 1923). Ontario led the other provinces in wool production; the 1921 output was valued at $6,953,824. In 1923, all agricultural products for the province were valued at $400,511,000, the total for the Dominion being $1,342,132,000. Farmers' organizations were widely prevalent, and many of them concerned themselves seriously with the problem of cooperative marketing. Such plans for the dairymen and fruit growers received the support of the government. Attention was also directed by an interested agricultural ministry to the necessity of creating cooperative credit societies. Other industries yielded: fisheries, in 1921, $3,065,042, made up of fresh-water catches of herring, pickerel, pike, trout, and whitefish; forest products in 1921, $26,193,280, made up of lumber, shingles, and lath. In the value of lumber cut away and in the making of lath, Ontario led all the other provinces. In the manufacture of pulp and the production of paper, Ontario was second only to Quebec. For 1920, $59,647,000 in paper was turned out.

In mining activities, too, Ontario led all the other provinces. Figures for metallic production for 1922 were: gold, $20,678,862; silver, $31,280; nickel, $6,158,993; copper, $1,464,477; total, including all others, $37,737,252. Nonmetallic minerals, including natural gas, crude petroleum, structural materials, and clay products, yielded $28,128,777. Grand total for 1922, $65,866,029; for 1911, $42,796,162. There were 91 mining companies incorporated in Ontario

with a capital of $181,040,000. In 1922, the Ontario mineral output was 36 per cent of the total Canadian production. Under the active administration of the Hydro-Electric Commission, the extension of the use of water power for energy went on. By 1922, 214 municipalities, 47 townships, and 48 commercial institutions were being served. Revenues for 1922 were $12,756,104, and costs of maintenance, etc., together with sinking fund, $11,343,766; this left a surplus of $1,412,338. (Revenues for 1913 were $2,611,918) The growth of this experiment in public ownership may be gathered from the following: 1910: horse power, 750; municipalities and townships, 10; 1923: horse power, 1,299,230; municipalities, etc., 214. Total assets of the Commission and the municipalities, in 1913, $11,907,826; in 1922, $55,126,834. Many projects were under way; one of the most important was the Chippewa Canal scheme which was to produce 600,000 horse power at a construction cost estimated at $70,000,000. This plan, because of its ambitious nature, aroused discussion of a very controversial character.

Manufacturing prospered and Ontario continued to lead all the provinces In 1921 there were 18,093 industrial establishments (8001 in 1910), capitalized at $1,620,681,181, and employing 258,345 workers (238,817 in 1910). Costs of materials were $744,433,905, and the value of the output was $1,411,276,431 ($579,810,225 in 1910). Leading industries were machinery, building construction, milling, packing, leather, boot and shoe production, hosiery, and rubber products.

Trade and Communications. In 1922 there were 10,881 miles of railway, as compared with 9000 in 1913 In 1919 there were 747,893 miles of telegraph wire (375,933 in 1912). In 1922–23 exports amounted to $372,734,182 ($132,756,532 in 1913) and imports to $406,946,109 ($301,651,328 in 1913).

Government. For 1913–14, revenues and expenditures were $11,121,382 and $11,819,311; by 1921–22, they had become $39,725,370 and $37,442,986 The Dominion subsidy and receipts from lands and forests had shown no increase, but new revenues were derived from succession duties and corporation taxes. The direct liabilities of the province by 1922 had risen to $204,959,690. Under an act of 1921 the province was empowered to enter the banking business for the carrying of savings accounts and life insurance business. The purpose was the application of such funds toward agricultural credits. On Jan 1, 1923, there was $3,864,091 in deposits in the provincial banks. There were, in 1921, 7231 elementary and secondary schools attended by 632,123 pupils (518,605 pupils in 1911). Besides, there were 621 separate Catholic schools with an enrollment of 83,977. The 1921 budget bore $5,919,055 for education ($842,278 in 1912). Total expenditures on education, provincial and local, in 1912, $13,492,108; in 1920, $36,739,564. The provincial university, the University of Toronto, was attended by 5100 pupils in 1921–22 Women were granted the ballot in 1918 and permitted to stand for the provincial legislature. In the Dominion Parliament the representation remained the same: House of Commons, 82; Senate, 24.

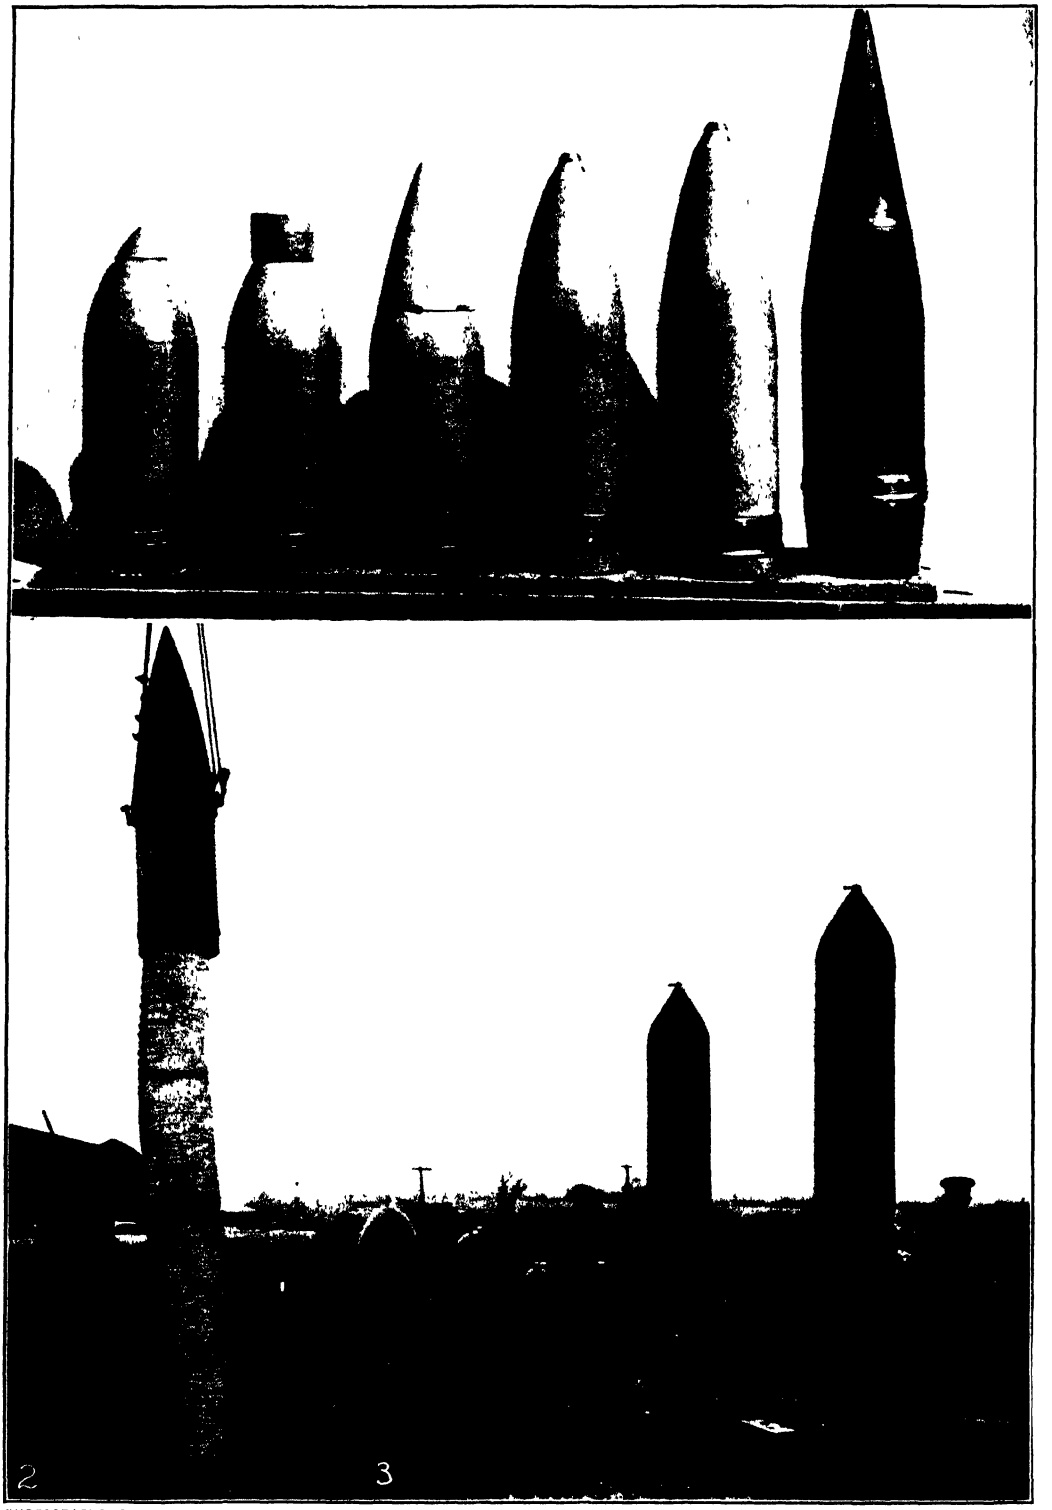
ORDNANCE. The War—greatest of international conflicts—had a correspondingly great effect on the development of implements of war, collectively called ordnance. The ingenuity of a nation fighting for existence, with its back to the wall, is stimulated to the utmost in developing means for overcoming the common enemy Science, engineering, and industry united in strenuous endeavors to make more effective the nation's man power by supplementing it with every mechanical improvement over man himself. Matériel, as contrasted with personnel, became to a greater and greater extent the determining factor in warfare—but another phase of the industrial revolution characteristic of the last century. Ordnance comprises all the things the soldier fights with, as distinguished from the material things that merely provide him with a more or less comfortable existence, such as food, clothing, shoes, shelter, fuel, means of transportation, etc. The ordnance equipment of a modern army includes about 1200 separate and distinct types of units, which in their assembly require the manufacture of 250,000 separate and distinct components.

The infantryman requires shoulder rifles by the million; cartridges for them by the billion; light one-man automatic rifles by tens of thousands for use in tight places calling for short concerted bursts of fire; heavy machine guns by thousands for playing the continuous leaden stream of the modern machine-gun barrage; sensitive sights and rugged tripods with elevation and traverse devices to insure placing the deadly hail with safety to his own advancing lines and maximum damage to the enemy; carts to carry his machine guns and water jackets to cool them; rifle grenades and rifle attachments to throw them; explosive hand grenades for defense against enemy raiding parties and for mopping up trenches on the offensive; gas grenades for making enemy dugouts uninhabitable and Thermit grenades for fusing the breech mechanism of captured enemy cannon and machine guns, continued possession of which is doubtful; bayonets and bolos, trench knives, helmets, periscopes, range finders, etc, not to mention the "baby" 37-mm. cannon for wiping out hostile machine gun nests and 3-inch trench mortars of simple yet most effective design.

The artilleryman requires field pieces by the thousand for divisional artillery—the "75" gun and its companion piece, the 105-mm. howitzer; heavy pieces for corps artillery—the 4 7-inch gun and its companion piece, the 155-mm. howitzer; high-powered, medium-calibre pieces for army artillery—155-mm. guns and 8-inch howitzers; 8-, 10-, 12- and 14-inch guns and 16-inch howitzers on railway mounts to reach the enemy's back area; 16-inch guns on permanent barbette emplacements for coastal defense; self-propelled caterpillar mounts for all calibres from the 75-mm gun to the 240-mm. howitzer, capable of negotiating steep grades, accompanying its tactical unit at all speeds and ready to go into action immediately on arrival at the firing-point and depart to safer regions immediately its mission is accomplished. For the effective use of his weapons, the artilleryman requires vast quantities of ammunition: shrapnel, high-explosive shells and gas shells by millions of rounds, each an intricate mechanism in itself.



PHOTOGRAPHS, ORDNANCE DEPARTMENT, UNITED STATES ARMY

UNITED STATES ARMY ORDNANCE

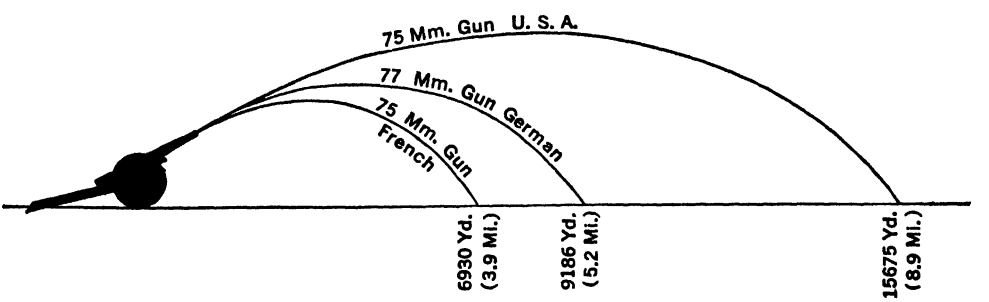
1. Various Types of 6 inch Projectiles
2. Projectile (Weight 2340 Pounds) and Powder Charge (650 Pounds) for 16-inch United States Army Gun for Range of 55,000 Yards

The aviator requires stripped machine guns speeded up to 1400 shots per minute, adjusted with inconceivable nicety to shoot between the rapidly revolving blades of his propeller; electric heaters to prevent freezing of the lubricating system of his gun mechanism at high altitudes; shot counters to indicate the available amount of ammunition remaining; armor-piercing bullets for use against armored airplanes or in low flying action against tanks; incendiary bullets to ignite the gas contents of enemy captive balloons and dirigibles; tracer bullets to assist in correcting his aim; ingenious sights to correct automatically for the relative speed and direction of his own plane and his target; airplane bombs, from the small 25-pound fragmentation type for use against enemy troops, to the 4000-pound bomb for attack on battleships or fortified enemy positions; bomb sights to determine the proper instant for release, and release mechanisms to carry his huge instruments of destruction with safety to himself and to release them accurately in order to inflict the most damage on the enemy.



To supplement the waves of attacking infantry, light two-man tanks equipped with a single machine gun; heavy tanks equipped with 37-mm. cannon and four machine guns—urged irresistibly forward by 500-horse power Liberty engines crossing trench systems, shell craters and other obstacles by means of its powerful caterpillar track-laying mechanism—are needed.

Pyrotechnics are drafted into war service to obtain communication among the various elements of attacking waves, to smoke-screen daylight raids, to illuminate the immediate foreground and thereby prevent surprise night attacks, as well as to guide night-flying airmen to a safe landing on an otherwise unilluminated landing field.

The cost of equipping a modern army with necessary amounts of up-to-date ordnance can be sensed from the estimates of 12½ billion dollars made for the equipment of the first five million American troops called to the colors during the War. The impetus given to ordnance design by that conflict has continued, inasmuch as the length of time in which the United States was actively in the War did not permit the full development of many promising devices. While accurate information in regard to advances in the field of ordnance design by other armies is not available, it can safely be assumed that they have made at least as much progress in this direction as a recent announcement indicates has been made in the United States Army. A general idea of the relative effectiveness of ordnance used during the War and that developed since the Armistice can be gained from the statement that in the United States Army, the new 75-mm. gun has twice the range of the French "75" used in 1918; the new 4.7-inch gun has two and one-half times the range of the pre-war model and fires a heavier projectile; the new 155-mm. gun outranges the French gun of the same calibre used during the War, by nearly five miles; the largest aërial bomb effectively used during the War weighed only 400 pounds; the latest successful development weighs 4000 pounds

French Gun—12.2 lb
German Gun—14.96 lb.

and contains over a ton of explosive; the 50-calibre super-machine gun shoots a bullet weighing four times as much as the 0.30 calibre Browning and has three times the range of the weapon used in the War; the latest caterpillar mount for divisional artillery has attained a maximum speed of 30 miles on good roads, as contrasted with the 8 or 10-mile per hour maximum of the War. See ARTILLERY; EXPLOSIVES; GUNS, NAVAL; PROJECTILE; SMALL ARMS; TRENCH WARFARE MATERIAL; STRATEGY AND TACTICS.

ORE DEPOSITS. See GEOLOGY, ECONOMIC; ALSO GEOLOGY.

OREGON. Oregon is the ninth State in size (96,699 square miles), and the thirty-fourth in population; capital, Salem. The population increased from 672,765 in 1910 to 783,389 in 1920, a gain of 16.4 per cent. The white population increased from 655,090 to 769,146, while the Indian population decreased from 5090 to 4590; the Chinese decreased from 7363 to 3090, and the Japanese increased from 3418 to 4151. The negro population showed an increase of from 1492 to 2144; and the native white, from 552,089 to 666,995. The foreign-born white population decreased from 103,001 to 102,151. Both urban and rural populations mounted during the decade: the former from 307,060 to 391,019; the latter from 365,705 to 392,370. The growth of the principal cities was as follows: Portland (q.v.), from 207,214 in 1910 to 258,288 in 1920; Astoria, 9599 to 14,027; Salem, 14,094 to 17,679.

Agriculture. As Oregon is one of the important grain-growing States, agricultural conditions were affected in the decade 1913–23 by the fluctuations in price and production of grains during the War and post-war period. This situation is treated in detail under AGRICULTURE, CORN, WHEAT, BARLEY, etc. While the population of the State increased 16.4 per cent in the decade, the number of farms increased 10.3 per cent (from 45,502 in 1910 to 50,206 in 1920); the acreage in farms increased from 11,685,110 to 13,542,318; and the improved land in farms, from 4,274,803 to 4,913,851 acres. The percentage of total land area in farms increased from 19.1 in 1910 to 22.1 in 1920; the percentage of improved land in farms, from 7 to 8 per cent. The total value of farm property apparently increased 55 per cent in the decade, from $528,243,782 to $818,559,751; the average value per farm, from $11,609 to $16,304. In interpreting these values and all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 50,206 farms in 1920, 39,863 were operated by owners, 916 by managers, and 9427 by tenants. The corresponding figures for 1910 were 37,796, 847, and 6859. White farmers in 1920 numbered 49,633, compared with 44,875 in 1910; colored farmers numbered 573, compared with 627. Farms free from mortgage in 1920 numbered 18,077, and those under mortgage, 17,843; in 1910, 24,855 farms were free from mortgage, and 12,632 were mortgaged. The total number of cattle in 1920 was 851,108; in 1910, 725,255. Of these, 280,411 in 1920 were dairy cattle; in 1910, 172,550. The number of hogs increased from 217,577 to 266,778; the number of sheep decreased from 2,699,135 to 2,002,378. The estimated production of the principal crops in 1923 was as follows: corn, 2,344,000 bushels; spring wheat, 4,565,000 bushels; winter wheat, 21,725,000 bushels; oats, 10,773,000 bushels; barley, 3,234,000 bushels; potatoes, 5,852,000 bushels; hay, 2,103,000 tons; and apples, 7,253,000 bushels. Comparative figures for 1913 are: corn, 598,000 bushels; wheat, 15,717,000; oats, 15,228,000; barley, 4,200,000; potatoes, 6,750,000; and hay, 1,732,000 tons.

Mining. The mineral resources of Oregon are not fully developed. Among the minerals produced are sand and gravel, gold, copper, silver, cement, and stone. The production of gold, copper and silver during the decade 1914–24 was as shown in the table. In addition to the minerals mentioned above, the State also produces mineral waters and a small quantity of natural gas. The total value of the mineral products in 1921 was $5,199,803, compared with $5,496,253 in 1920; $3,962,822 in 1919; $4,191,740 in 1918; and $3,331,132 in 1914.

MINERAL PRODUCTION IN OREGON

Year	Gold Valued at	Silver Fine Ounces	Copper Pounds
1914	$1,591,461	142,552	39,248
1916	1,902,179	231,342	3,581,886
1918	1,270,465	107,323	2,451,016
1920	1,017,490	82,743	2,355,276
1921	822,034	42,120	174,300
1922	631,568	. . . .	. .

Manufactures. Oregon is not one of the most important industrial States, but its manufacturing activities are constantly increasing In 1920 there were in the State four cities with more than 10,000 inhabitants, forming 38.4 per cent of the total population of the State; and these, in 1919, reported 60 4 per cent of the State's manufactured products. There were in the State 2246 manufacturing establishments in 1909; 2320 in 1914, 2707 in 1919. Persons engaged in manufacture numbered 34,722, 35,449, and 68,005, and the capital invested amounted to $89,081,873, $139,500,379, and $237,254,736 in those years. The value of products in 1909 amounted to $93,004,845; in 1914, $109,761,951; and in 1919, $366,782,627 The increase in value of products in 1914–19 was in great measure due to changes in industrial conditions brought about by the War and cannot be taken as an index of the growth of manufactures during that period; but the increase in the average number of persons employed clearly shows steady growth in the manufacturing activities of the State. The first industry in point of value of products is that relating to lumber and timber products: in 1909, valued at $30,200,000; 1914, $30,920,000; and 1919, $95,264,000. Flourmill and gristmill products rank second in this respect: in 1909, $8,801,000, 1914, $11,193,000; 1919, $42,550,000. Foundry and machine-shop products, in third place, were valued, in 1909, at $3,135,000; in 1914, $3,823,000; and in 1919, $31,689,000. Slaughtering and meat packing, next in order, had products valued in 1900 at $5,880,000; in 1914, $7,487,000; and in 1919, $15,868,000. The chief manufacturing city is Portland; other less important are Astoria, Eugene and Salem. In 1909, there were in Portland 649 manufacturing establishments, with a product valued at $46,861,000; 837 in 1914, with $55,697,000; and 846 in 1919, with $196,380,000.

Education. Oregon is one of the most progressive States in educational matters, and the high standard of efficiency in its educational system was maintained in the decade 1914–24. A new compulsory education law was adopted by the people at the general election held in November, 1922, by the terms of which all children between the ages of 9 and 15 were required to attend school for a term or period of not less or more than the number of months the public school holds session in the district in which their parents or guardians reside. The history of the State is required to be taught in the schools, and there are also courses in moral instruction and physical education. In 1918, the Legislature enacted a physical education law making it mandatory that all pupils in the elementary and secondary schools receive physical training for an average of at least 20 minutes a day. Progress was made during the decade in the rural schools and in nearly every county of the State consolidation was under way. The total number of consolidations for elementary schools for 1923 was 77, with an enrollment of 5585 pupils. In 1914, the State adopted a uniform system of standards for country and village schools. A movement for junior high schools developed. The Legislature of 1919 established a State Board for Vocational Education and substantial progress was made in this field, in agriculture, home economics, and technical training. The total enrollment in the elementary schools in 1920–21 was 160,924; in the high schools, it was 29,235; and the expenditure for educational purposes was $14,783,718. Illiteracy in the State decreased from 2.2 per cent in 1910 to 1.8 per cent in 1920; in the native white population it remained at 0.5 per cent; among the foreign-born white, it decreased from 5.9 to 5.4 per cent; among the Negro, it increased from 3.7 to 5.5 per cent.

Finance. For finance, see STATE FINANCES.

Political and Other Events. The Democratic and Republican parties alternated in political control of important offices in Oregon in the decade 1914–24. In 1914 elections were held for governor and for United States Senator. The Republican candidate for governor, James Withycombe, was elected; the Democrats re-elected Senator Chamberlain. In this election an amendment to the constitution, adopted by a large majority, prohibited the sale or manufacture within the State of intoxicants, but permitted importations. An amendment abolishing capital punishment was also adopted, but six years later capital punishment was restored by vote of the people. In a special election held in January, 1915, Kathryn Clark was elected State Senator; she was the first woman to fill this position. Women participated in the elections for the first time in 1916. Minor State officers only were chosen. In the presidential voting of this year, Charles E. Hughes received 126,968 votes; Woodrow Wilson, 120,125. The prohibition section of the constitution adopted in 1914 was in this year amended to prohibit importation of intoxicants into the State. An amendment empowering the governor to veto single items in appropriation bills was also carried. On June 7, 1916, the Columbia River Highway, one of the greatest scenic roadways ever constructed, was dedicated. In 1917 the policy of expending automobile license revenues on permanent highway construction was adopted. Through capitalization of these revenues, more than $40,000,000 was expended on pavement of trunk highways. Elections were held in 1918 for governor and United States Senator. Governor Withycombe was re-elected, and Charles L. McNary, who had been appointed United States Senator on the death of Senator Lane, was elected to the Senate. Governor Withycombe died in office, Mar. 3, 1919, and was succeeded by Secretary of State Ben W. Olcott. There was an election in 1920 for United States Senator. Senator Chamberlain, a candidate for reëlection, was victoriously opposed by Robert N. Stanfield, Republican. In the presidential voting of this year, Warren G. Harding received 143,592 votes; James M. Cox, 80,019. The Democrats in 1922 elected their candidate for governor, Walter M. Pierce, who defeated Governor Olcott, Republican. At this election the voters adopted a compulsory school law which required that children over 8 and under 16 years of age be sent to the public schools during the school year. This law was framed with a view of suppressing private and parochial schools. It was sponsored by the Scottish Rite Masons and was supported by the Ku Klux Klan. The law was declared unconstitutional by the United States District Court, Mar. 31, 1924. Governor Pierce was inaugurated in January, 1923. In his message to the Legislature he recommended reductions in the State appropriations and called for a general revision of the system of taxation.

Legislation. The most important acts of the Legislature in the decade 1914–24 are given below. In 1915 a law was enacted, in accordance with the vote of the people in 1914, to prohibit the sale or manufacture of liquor in the State; but it permitted importations in limited quantities to individuals. In 1917, at the request of Secretary Lansing, the Legislature withdrew certain anti-alien bills designed to prevent Japanese from owning land in the State. Provision was made for a rural credit system and for the establishment of county tuberculosis sanitoria and hospitals. This Legislature also passed a "bone-dry" prohibition bill and amended the laws relating to courts. Further amendments in the laws relating to the judiciary were made in 1919 This Legislature also created a legislative reference service and passed measures forbidding the display of the red flag or any other symbol or emblem calculated to excite hostility or violence to the government. In 1921, the Legislature provided for a State Board of Aviation; created a State Board of Control and Budget Commission, and made provision for the Americanization of the foreign-born. It adopted, subject to approval by the people, which was thereafter given, optional cash or loan bonuses to veterans of the War. In 1923 the Legislature passed an income tax law and an eight-hour law for lumber workers. It also established a Judicial Council with the Chief Justice as chairman. At this session measures were passed against the holding of land by aliens, and a law was enacted requiring voters to be able to read and write English. The sale of narcotics was made a felony.

OREGON, UNIVERSITY OF. A coeducational State institution at Eugene and Portland, Ore., founded in 1872. The Schools of Education, Physical Education and Sociology were founded between 1914 and 1924. During the period the enrollment increased from 1765 to approximately 2600, of whom 1500 were men and 1100

SIR WILLIAM ORPEN
"THE COSTERMONGER"

the most severe fighting of the War. He received decorations from foreign governments and the American Distinguished Service Medal. He was appointed a member of the Public Service Commission of New York in 1922. In 1924 he conducted as counsel the investigation into the conduct of the Veterans' Bureau.

OSBURN, RAYMOND (1872–). An American zoölogist, born at Newark, Ohio, and educated at Ohio State University and Columbia University. He was instructor in biology at Starling Medical College (1898–99); professor of biology at the Fargo (N. D.) College (1899–1902), instructor at the New York High School of Commerce (1903–07); instructor in zoölogy (1907–10) and assistant professor (1910–15) at Barnard College; professor of biology at Connecticut Women's College (1915–17); and professor of zoölogy at Ohio State University (1917–). Professor Osburn published taxonomic papers on the bryozoa and was for a number of years on the investigation staff at the United States Bureau of Fisheries Laboratory at Woods Hole, Mass

O'SHAUGHNESSY, EDITH COUES (MRS. NELSON O'SHAUGHNESSY) (?–) An American writer, born in Columbia, S. C, and educated under private tutors In 1901 she married Nelson O'Shaughnessy of New York, who was in the diplomatic service. While the latter was chargé d'affaires in Mexico in 1916 she made careful notes of political and social affairs which enabled her to write *A Diplomat's Wife in Mexico,* an enlightening and entertaining account of stirring events in that country. This was followed by *Diplomatic Days in Mexico* (1917); *My Lorraine Journal* (1918); *Alsace in Rust and Gold* (1919), and *Intimate Pages of Mexican History* (1920).

OSLER, SIR WILLIAM (1849–1919). A physician and author (see VOL. XVII). During the period from 1914 to the time of his death, Dr. Osler wrote two major works, *A Concise History of Medicine* (1919) and *The Evolution of Modern Medicine* (1921). Since his demise, extracts from his works have been edited by C. N. B. Camac with the title *Counsels and Ideals* (1921). A fifth edition of the essays entitled *Æquanimitas* appeared in 1923, and the ninth edition of Osler and McCrae's *Principles and Practice of Medicine* in 1920.

OSTWALD, WILHELM (1853–). A German chemist and philosopher (see VOL. XVII). He was editor of *Der Monist* (1912–15) and later published *Der Farbenatlas* (1917); *Die Farbenlehre* (1918–19); *Die Harmonie der Farben* (1918), *Goethe, Schopenhauer, und die Farbenlehre* (1918); *Die Farbkorper* (1919); *Die Farbschule* (1919), and *Einfuhrung in die Farbenlehre* (1919) He lectured at Columbia and Harvard Universities and founded a laboratory for color study in Dresden in 1920.

OTIRA TUNNEL. See TUNNELS.

OVERMAN, LEE SLATER (1854–). An American legislator (see VOL XVII). He was reëlected to the Senate for a third term in 1914. This was the first senatorial election by a direct vote of the people of the State. In 1920 he was reëlected for a fourth term He was one of the most conspicuous of the Democratic members of the Senate

OVERTON, GRANT M(ARTIN) (1887–). An American writer, born at Patchogue, N. Y. He studied at Princeton University from 1904 to 1906 and for several years was on the staffs of newspapers in New York, Denver, and San Francisco After a trip at sea before the mast, he became an editorial writer for the New York *Sun* in 1910 and was later its literary editor and contributor to several magazines His books include *The Women Who Make Our Novels* (1918); *Mermaid* (1920); *World without End* (1921), and *The Answerer,* a novel on the life of Walt Whitman (1921)

OWEN, ROBERT LATHAM (1856–). An American legislator (see VOL XVII) and United States Senator from Oklahoma. He first took his seat in 1907 and was reëlected in 1912 and again in 1918 for the term expiring Mar. 3, 1925 He was a member of several important committees including that of appropriations, banking, and currency

OZONE. See CHEMISTRY.

P

PACIFIC OCEAN ISLANDS. The more important groups of islands in the Pacific Ocean are given below. For American possessions, see PHILIPPINE ISLANDS, HAWAII, GUAM, SAMOA. For the Yap agreement, see YAP. For a discussion of the political problem of the Pacific see WASHINGTON CONFERENCE.

Caroline and Pelew Islands. A group of islands in the Western Pacific, formerly part of German New Guinea, but since 1918 a Japanese mandate territory. The islands were divided into two groups (1) the Eastern Carolines with Ponapé as the centre; and (2) the Western Carolines with Yap as the centre. The population reported (1921) was made up of 644 Japanese, 14 Europeans, 15 Chinese, and about 40,000 natives Copra was the chief export See YAP for the dispute between the United States and Japan over the disposition of this island.

Cook Islands. A group in the Southern Pacific belonging to New Zealand. Total area, 280 square miles; population, in 1921, 13,209. In 1915 the laws for the islands were consolidated and a member of the New Zealand Executive Council was made minister of the Cook Islands. In 1921, imports totaled £139,313 and exports £86,082 Trade was largely with New Zealand, exports being mainly fruits. Copra was sent to the United States (£11,841 in 1921). Revenues for 1921–22 were £22,011 and expenditures £32,422. A wireless station was erected on Rarotonga, the chief island. Many of the islands were leased to private coconut companies for exploitation The Niué islands had a population of 3750 and were concerned largely with copra production (exports in 1920 were about £40,000).

Fiji Islands. A group of 250 islands in the Southern Pacific, constituting a British crown colony. The largest are Viti Levu and Vanua Levu. Total area, including Roturna (a dependency), 7038 square miles; population (1921), 157,266, made up of 3878 Europeans, 84,475 Fijians, 60,634 Indians, 910 Chinese, 2781 half-castes In attendance at the Methodist churches in 1921 were 78,944 natives. The government was aiding 50 schools out of a total 1000 on the islands In 1921, there were under cultivation by Europeans and Indian settlers 45,800 acres of coconuts, 68,500 acres of sugar cane, 11,300 acres of rice Bananas, maize, tobacco, rubber, beans, were other crops. Exports in 1913 were £1,425,940; in 1921, £2,457,-851 (sugar, £2,053,000). Imports for the same years were £903,968 and £1,509,732. The trade was carried on largely with British possessions. Revenues and expenditures for 1913 were £266,-037 and £258,792; for 1921, £569,722 and £752,-038 There was a public debt in 1922 of £350,-000 (£93,515 in 1911) Wireless telegraph stations were erected at Suava, Labasa, Taveuni, and Savusavu. The governor of Fiji was also high commissioner for the Western Pacific.

Gilbert and Ellice Islands Colony. These islands were annexed as a colony to Great Britain in November, 1915. The Gilbert Islands are on the equator and have an area of 166 square miles, and a population of 30,000. The Ellice Islands have an area of 14 square miles, and a population of 3500 Ocean Island, the colony headquarters, had a population of 1000. A wireless station here maintained telegraph communication with the outside world via Fiji and Australia The very rich phosphate deposits on the island were, after 1921, worked by the British Phosphate Commission. Other islands in the colony were the Union or Tokelau group, and the American Islands. Of the latter, Christmas Island was the largest atoll in the Pacific. It was leased in 1914 to the Pacific Coconut Plantations, Ltd., for exploitation; population, 2 Europeans and 40 Tahitians Fanning and Washington Islands, also in this group, were being worked by a coconut company. Total revenues for the whole colony for 1920–21 were £54,079 and expenditures £45,380. The trade in 1919–20 amounted to £129,788 for imports and £213,042 for exports (phosphates, £158,751; copra, £54,010).

Marianne or Ladrone Islands. A group of islands in the Western Pacific, formerly part of German New Guinea, but since 1918 a Japanese mandate territory. Native population numbered 3368 and the Japanese, 1754. Guam (q.v.), the largest island, belonged to the United States

Marquesas Islands. A group of islands in the Western Pacific belonging to France and administered from Papeete. Total area, 480 square miles; population, 2300, of whom 168 were white. Hivaoa and Nukahiva were the principal islands.

Marshall Islands. A group of islands in the Western Pacific, formerly part of German New Guinea, but since 1918 a Japanese mandate territory The group is made up of two chains, viz., Ratack (13 islands) and Ralick (11 islands). The population consisted of 102 Japanese, 5 Europeans, and 8901 natives. Coconut-palm plantations covered 1275 hectares, and the chief export was copra

Nauru. An island in the Western Pacific just south of the equator, formerly part of German New Guinea, but since 1920 administered by Great Britain under a mandate from the League of Nations. It is a circular atoll only 12 miles in circumference. Population in 1922: 110 Europeans, 514 Chinese, 1113 Nauruans, 392 other South Sea Islanders. The important phosphate deposits were placed in the hands of the British Phosphate Commission representing the governments of Great Britain, Australia, and New Zealand. Costs of administration, if ordinary revenues did not suffice, were to be met out of the phosphate sales. Phosphate exports increased from 101,267 tons in 1917 to 236,435 tons in 1921. Imports were

valued at £140,302 in 1921. Of the phosphate mined a royalty of sixpence per ton went to the Commission and a royalty of threepence to the native landowners. Of the latter, one penny per ton was paid into a trust fund held for all the Nauruans. The German wireless station, though dismantled by the Germans, was soon restored The island fell in September, 1914, before a British naval force and from 1915 on was occupied by a civil administration.

New Caledonia. A French colony in the Western Pacific consisting of the island of New Caledonia (area, 7650 square miles) and four groups of island dependencies. Population (1921), 47,500, made up of 13,138 free settlers, 5671 of convict origin, and 28,075 Melanesians and Polynesians. Nouméa, the capital, had 10,053 inhabitants of whom 6502 were free (1921). Leading products were nickel, chrome iron. manganese and cobalt (mineral export in 1921, 5,527,160 francs), as well as copra, hides, and preserved meats. Local blast furnaces produced 4486 tons of nickel valued at 5,819,300 francs. Total exports for 1913, 1920, 1921 were 15,838,405 francs, 43,043,449 francs, 26,676,000 francs. Imports for 1921 were 48,565,000 francs France, on an average, took 8 per cent of the exports and sent 18 per cent of the imports. The budget for 1922 balanced at 8,831,925 francs. The Loyalty Islands, which belong to this group, possessed rich guano deposits; on the Wallis and Horn Islands, copra was the leading product. The latter were formed into a colony in 1913.

New Hebrides. These were administered jointly by French and British officials. Area, 5500 square miles; population (1921), 60,000, of whom 677 were French and 226 British. Several French and British trading companies operated here. Imports in 1920 were £159,174; exports (maize, copra, coffee, cotton, sandalwood, cocoa), £245,187. The French reported a total trade of 13,051,527 francs in 1921, of which 9,768,625 francs represented the French activities and 3,282,802 francs the British. Intercourse was mainly with Sydney and Nouméa (New Caledonia) The joint revenues in 1921 amounted to £25,892, and the joint expenditures, £18,947. Ownership of land was divided as follows: French, 617,000 hectares; British, 129,000 hectares. Beginning with 1919 the islands became the seat of a strong agitation for the termination of the condominium (1906) and accession by France. The question was discussed at the British Imperial Conference in 1921, and again later in the year, when an offer was made by a French private company to buy out the British rights. Complaints were frequent, particularly over the cumbersome methods of administrating justice However, the condominium was renewed by the protocol of London on Mar. 18, 1922.

Norfolk Island. An island in the Southern Pacific, a dependency of Australia. Area, 13 square miles; population (1921) 717. Up to 1914 it was governed from New South Wales. Imports in 1920–21 were £22,673 and exports £13,091. To encourage the fish industry the Commonwealth granted an annual subsidy of £1000 (for three years).

Phœnix Group. This was made up of eight islands with a total area of 16 square miles, and a population of 59. They belonged to Great Britain but were leased to a trading company for coconut planting.

Samoa. A group of islands in the Western Pacific, formerly a German possession, but since 1920 administered by New Zealand under a mandate from the League of Nations. The group, comprising the large islands of Savaii and Upolu and several adjacent islets, was given the name Territory of Western Samoa. Area, about 1300 square miles; population (1922), 2074 Europeans, 33,953 native Samoans, 1547 coolie laborers, 217 other islanders Education was in the hands of the London Missionary Society, the Methodist Mission, the Catholic Mission, and the Latter Day Saints' Mission. Imports for 1921 were £408,892 and exports £241,539 (copra and cocoa beans largely). Revenues for 1921–22 were £135,569 and expenditures £137,181. The United States took most of the copra exported. New Zealand forces occupied the islands on Aug. 29, 1914 In 1918, 7500 natives died from influenza, the region being one of those that suffered most severely. A wireless station was erected at Apia, the Territory's port. The local administration made provision for a nominated legislative council in which native Samoans might have seats. For the American Samoan islands, see article SAMOA.

Society Islands. A group in the Western Pacific belonging to France. Total area, 1650 square kilometers; population, 21,543. Tahiti, the most important island, has an area of 1042 square kilometers, and a population of 11,378, of whom 2903 were white. Papeete, on Tahiti, was the seat of administration of the French Establishments in Oceania, and possessed a wireless station. It had 4601 inhabitants of whom 2126 were white. The chief industries of Tahiti were the preparation of copra, sugar, and rum. Vanilla, coffee, and cacao were again being cultivated. Other islands belonging to the Society group were Moorea (area, 132 square kilometers; pop., 1616) and Iles-sous-le-Vent (area, 363 square kilometers; pop. 6689).

All the French Establishments (i.e Society Islands, Marquesas, Tuamotu, and Tubua groups) had a total area of 4395 square kilometers, and a population in 1921 of 31,655, made up of 2655 French, 2687 other whites, 743 Chinese, and the rest natives Leading exports were copra, mother-of-pearl, hides, coconut oil, phosphates, coffee, vanilla, cotton Exports in 1913, 1920, 1921 were valued at 11,554,507 francs, 24,360,900 francs; and 15,000,000 francs Imports in 1921 were 14,210,000 francs. In 1920 only 4 per cent of the imports came from France, and only 6 per cent of the exports went to the mother country. The budget for 1922 balanced at 6,500,000 francs; in 1911 it had been 1,745,000 francs Some 5000 lives were lost in these islands in the influenza epidemic of 1918.

Solomon Islands. A British protectorate in 8°S. and 160°W., made up of 15 large islands and the following groups: Lord Howe group, Santa Cruz Islands, Mitre Islands, and the Duff or Wilson group. Total area, 11,000 square miles; European population (1919), 675; native population, 150,000; Asiatics, 75. Coconuts were cultivated over 30,000 acres; other products were rubber, fruits, copra (8160 tons in 1919–20). Imports for 1921–22 were £251,564; exports (mainly copra), £182,887. Revenues for 1921–22 were £56,433; expenditures, £45,451. The islands in the group owned by Germany became part of the Australian mandate territory of New Guinea (q.v.) after the War.

Tonga or Friendly Islands. A group of

islands in the Western Pacific, forming a British protectorate. Total area, 385 square miles; population (1919 estimate), 23,562, made up of 22,689 Tongans, 250 half-castes, 247 other Pacific islanders, 376 Europeans The natives were Christians, belonging to the Free Church of Tonga, Methodist, and Catholic Churches. Copra was the chief product, more than half of it going to the United States. Imports and exports each averaged £170,000 after the War. Exports in 1920 amounted to £380,157. Revenues in 1920–21 totaled £91,000 and expenditures £66,000 A wireless station at Nukualofa was in touch with Samoa and Fiji. The reigning sovereign, Queen Salote, came to the throne in 1918.

Tuamotu Islands. A group in the Western Pacific belonging to France and administered from Papeete. Total area, 55 square kilometers; population, 2378, of whom 82 were white. Makatéa, the principal island, had important phosphate deposits In the Gambier Islands, pearls and mother-of-pearl were the leading products.

Tubuai Islands. A group in the Western Pacific belonging to France and administered from Papeete Area, 124 square kilometers; population, 2301, of whom 66 were white. Coffee was being grown here.

PACK, CHARLES LATHROP (1857–). An American forester and economist, born at Lexington, Mich , and educated in the public schools at Cleveland He studied forestry in Germany. For several years he explored forests in Canada, the Northwest, Louisiana, and Mississippi He was a director and official in many important financial institutions and from 1917 to 1919 president of the National War Garden Commission. He was president also of the American Forestry Association from 1916 to 1920 and of the National Conservation Congress in 1913. He was chairman of the French Agricultural Committee of the American Commission for devastated France. For his services in France he was awarded several medals He wrote much on agricultural subjects, including *The War Garden Victorious*, *Memorial Trees*, and *Roads of Remembrance*.

PACKING INDUSTRY. See LIVE STOCK.

PADELFORD, FREDERICK MORGAN (1875–). An American educator, born at Haverhill, Mass , and educated at Colby College, Yale, and Oxford He was for one year a fellow at Yale and from 1889 to 1901 was professor of English at the University of Idaho In the latter year he became professor of English at the University of Washington, and in 1920 dean of the Graduate School at that university. He was a member of several societies and author of *Old English Musical Terms* (1900); *Early Sixteenth Century Lyrics* (1906); *Samuel Osborne, Janitor* (1913); *George Dana Boardman Pepper, a Biographical Sketch* (1914); and *The Poems of Henry Howard, Earl of Surrey* (1920). He also translated and edited many English texts and contributed to *The Cambridge History of English Literature* and to European and American magazines

PADEREWSKI, IGNACE JAN (1860–). A Polish pianist and composer (see VOL XVII). On May 9, 1917, he made at the Metropolitan Opera House, on the occasion of a gala performance in honor of General Joffre, his farewell appearance, which he declared was to close forever his pianistic career. He then plunged into the midst of the political turmoil. At the beginning of the War and after, he had appeared at his concerts also as a political orator of no mean ability and contributed the greater part of the proceeds to the cause of Poland. After 1917 he devoted his entire time and energy to recruiting from among the Poles in the United States an army of 100,000 men and 50 officers, which subsequently constituted the greater part of the Polish Army in France. As soon as circumstances permitted, he went personally to Poland (1918), where he became the leader of the Conservative party and was largely instrumental in organizing the new Polish Republic, of which he became Premier and Minister of Foreign Affairs (Jan. 26, 1919) In this capacity he took active part in the Peace Conference at Versailles. The unsettled conditions in Poland brought about the downfall of the cabinet in December, 1919; and Paderewski, his health seriously impaired by the stress of events, retired to his estate at Paso Robles (California) Here, however, he kept in close touch with the political situation of his native country As he had sacrificed the greater part of his fortune to the cause of Poland, he found himself compelled to rescind the resolution regarding his artistic career, and on Nov. 22, 1922, he reappeared amidst scenes of indescribable enthusiasm at a recital in New York. Fortunately for art, he continued his distinguished artistic career and proved that the intervening five years of political excitement had not in the least impaired his supreme mastery See POLAND, *History*

PAGE, HERMAN (1866–). An American bishop, born at Boston, and educated at Harvard and at the Episcopal Theological School In 1891 he was ordained a priest in the Protestant Episcopal Church and until 1900 was in charge of mission churches in Idaho. He was rector of St. Paul's Church in Chicago from 1900 to 1914 and was consecrated bishop of Spokane, Wash , in 1914 He became bishop of Michigan in 1923

PAGE, THOMAS NELSON (1853–1922). An American writer and diplomat (see VOL. XVII). He was appointed ambassador to Italy by President Wilson in 1913 and served in that position through the difficult period of the War, until 1919 His conduct in this office did much to continue and increase the good feeling between the Italian and American governments His later books include *The Land of the Spirit* (1913) *and Italy and the World War* (1920).

PAGE, WALTER HINES (1855–1918) An American publisher, writer, and diplomat (see VOL. XVII). In 1913 he was appointed ambassador to Great Britain His strong and frankly expressed sympathy with the English attitude during the years in which he held this post made him a popular figure in England. Much of his time, as indicated in his letters, was spent in convincing President Wilson and the officers of his government of the necessity of taking a more aggressive attitude and in favor of the Allies During his ambassadorship, he won high praise in all quarters by the tact which he displayed and his skill in dealing with delicate and complicated problems His strength was unable to withstand the strain imposed on him, and he returned to the United States very ill, in 1918 He resigned his post in 1918 and returned to the United States, where he died on December 22. His *Life and Letters*, published in 1923, is one of the most illuminating records of

the events of 1914 to 1918 in international politics.

PAGE, WILLIAM HERBERT (1868–). An American lawyer and educator, born at Mount Union, Ohio, and educated at Yale University and the law department of Ohio State University, where he was professor of law from 1896 to 1917. In the latter year he assumed a like position at the University of Wisconsin. His many writings on legal subjects included *Page on Wills* (1901), *Page's Ohio Digest* (1914); and *Compact Code* (1921).

PAHANG. See MALAY STATES, FEDERATED.

PAINE, ALBERT BIGELOW (1861–). An American author and editor (see VOL. XVII). His later writings include: *The Boy's Life of Mark Twain* (1916); *Mark Twain's Letters* (1917); *George Fisher Baker, a Biography* (1919); *A Short Life of Mark Twain* (1920); *The Car That Went Abroad* (1921); and *In One Man's Life* (1921).

PAINLEVÉ, PAUL (1863–). A French statesman and scientist (see VOL. XVII). In October, 1915, he was appointed Minister of Instruction and Inventions affecting national defense, in the Briand cabinet. He later succeeded General Galliéni as Minister of War. He was also a member of the War Committee and from September to December, 1917, Prime Minister and Minister of War. As Minister of War he was accused by the supporters of General Nivelle (q.v.) of having interfered with the French offensive of April, 1917. In 1920 he was appointed advisory director general of Chinese government railways. He was the author of several scientific books and *A Life of Nurse Cavell.*

PAINTING. The history of painting from 1914 to 1924 was a continuation of the struggle which became acute during the first decade of the twentieth century, between the movement known as modernism, or post-impressionism, or, better still, as expressionism, and impressionism and other more conservative factors in painting. The years of the War almost completely checked artistic production in Europe except in so far as it could be drafted into war service, and most of this war painting was propaganda rather than art. At the end of the War the situation was very much the same as in 1914, and the struggle was still continuing in 1924. Painters were concerned with studying the means of artistic production rather than with producing real works of art. Many theories were expounded and still more pictures put on canvas to demonstrate them, but relatively little of real value had been created. It was the threshold of a new epoch, but what the result would be no one could tell. One encouraging sign was that painters of the new tendencies were so much concerned with expression, with the inner truth, with the essence rather than with the mere aspect of nature. On the other hand, these same men often did inexcusable violence to the aspect of nature.

France. By the end of the first decade of the twentieth century impressionism had conquered its rivals, realism and other academic tendencies, and had become dominant in official as well as in artistic circles. From 1913–21 Paul Albert Besnard (1849–), an impressionist painter, was head of the Ecole de France à Rome and after 1922 director of the national Ecole des Beaux Arts at Paris. It was he above all others who applied the impressionist technique to mural painting. He was highly successful also as a portrait painter of women. Among other decorators of note were Jules Cheret, who united impressionism with the tradition of Fragonard; Henri Martin (1860–), the painter of Languedoc; and Aman-Jean (1860–). Most mural painters, however, never fully accepted impressionism. Among painters affected by it, Lucien Simon, with an admixture of realism, painted homely scenes; Charles Cottet, Parisian society. The chief pioneers of impressionism had for the most part passed on, Dégas in 1917, Renoir in 1919, both active and developing till the end: Claude Monet was still painting his scintillating landscapes. Among the younger men of strict impressionistic technique were Albert André, who is the best in still life; Maufra, Moiret, and Casals for Spanish subjects.

Great as were the achievements of impressionism, it had a serious defect which induced a speedy reaction. Concerned only with the representation of light, with the appearance of things, it had no inner life and lacked the gift of psychology. The various modernist movements therefore insisted on expressionism, i.e. that the painting should not so much represent nature itself as the painter's reaction towards nature, the emotions roused in him by the object depicted. This led to the rejection of nature as a norm. Rejecting also the flat surfaces of impressionism, the post-impressionists strove for solidity and structure. Design should be organized and not haphazard, as it is in nature; color and form symbolic, rather than realistic. One form of this reaction was symbolism, which presents nature in a symbolic as distinct from the actual form. Its foremost exponent was the delightful pastellist and illustrator, Odillon Redon (1840–1916). The group included such staunch modernists as Paul Serusier, Maurice Denis, Pierre Bonnard, and Edouard Vuillard. The art of the first two is mystic and religious, while that of the others is decorative; Vuillard especially has been influenced by Japanese art. One group's reaction against impressionism consisted of imitation of Italian fifteenth century art, or what the English call Pre-Raphaelitism. Foremost among them were Félix Valloton (1865–) and Jean Frélaut (1879–), both painters of Breton subjects.

The group known as "Les Fauves" was at first made up chiefly of pupils of Gustave Morot (1826–98), a symbolist. Rejecting their master's academic tendencies, they expressed themselves with such wildness that this term, signifying "wild beasts," was applied to them. Foremost among this group was Henri Matisse (1869–), a very abstract painter who pushes simplification to the utmost, striving indeed to attain the vision of a child. Both in line, of which he is a consummate master, especially of outline, and in color, his art recalls Chinese and Japanese painting. The group included also Kees van Dongen (1877–), a Dutchman, who painted fashionable Parisian society, and Modigliani (1889–1920), an Italian, who created simply colored figures on the conventions of negro art. Others of the "Fauves" afterward developed in various directions, some becoming cubists, others following Cézanne's lead. As time went on, Cézanne became more and more the dominant influence in modernist art. His closest follower was André Derain (1880–),

an artist of great power, both in figure and landscape, whose color became increasingly severe. Another important figure was Maurice de Vlaminck (1876–), a highly dramatic landscape painter of brilliant technique. It was he who discovered negro art as revealed in the wooden fetishes of the African savages, carved before their association with white men. Here was an art of pure plastic quality, simplified to the utmost, abstract in form, and with very remote resemblance to actuality. It greatly influenced the new movement, especially cubism. Among other artists once classed among the "Fauves" who were affected by cubism were Albert Marquet (1875–), Othon Friesz (1879–), Jean Marchand (1883–), and Segonzak (1884–). There was at the close of this period an increasing tendency among them to use forms based on nature rather than pure abstractions. A curious outgrowth of the modernist movement was feminism in painting. There have been women painters at all epochs, but their art has not differed materially from that of men. The art of Marie Laurencin, subtle in design, exquisite in color, is essentially feminine in spirit and conception, such as no man could have produced. That of Elizabeth Fuss-Amoré is very rich in color, subtly personal and feminine.

As a reaction against the flat surfaces of impressionism, cubism is concerned particularly with the expression of bulk and solidity. This it does by means of colored cubes and cylinders, following the dictum of Cézanne: "Nature can be expressed by the cube, the cone, and the cylinder. Any one who can paint these simple forms can paint nature." It is an art of organized space, linear form, movement, and color, dissociated from the actual appearance of things. The influences which contributed to its formation were Cézanne, Seurat, and especially negro and Polynesian sculpture. Matisse gave it its name and aided at its formation in 1908, but the real founder and leader had been and still was Pablo Picasso (1881–), a Spanish sculptor. He was the author of its conventions, such as the guitar, clay pipe, the bottle of alcohol, printed letters, etc. He has well been called "the chameleon artist," as he has worked in many different manners, with cubism as a phase of his development. His color, at first sombre, had finally become frank and clear. Georges Bracque was the purist of the group, a logical, rigid cubist; Fernand Leger represented the mechanical aspect. Albert Gleize, a facile writer on cubism, was painting in two rather than three dimensions, while Jean Metzinger was an orthodox cubist of the cylinder and cube variety Among other followers of the movement in 1924 were Auguste Herbin, André L'Hote, half cubist, half realist; Jacques Villon; Marcel Duchamps, and François Picabia. Two poets, Guillaume Apollinaire and André Salmon, belonged to the cubist group and wrote in its interest. The influence of cubism, wide and in many respects wholesome, was in the direction of solidity and expression. Many painters in different lands experimented with and to some extent adopted it. But in its rigid form cubism seemed at the close of the period to be on the wane. Picasso's latest works were more representative, under the influence of Ingres.

There had latterly been many secessions from cubism, mostly ephemeral, such as Orphism and synchronism, which are concerned with arrangements of color irrespective of volume or actuality, and Dadaism, founded in Switzerland in 1917, by Tzarra, a Rumanian. This form of presentation, which had followers in France and Germany, clears away the past and is satirical in character, better adapted to cartoons than to paintings.

Italy. A later and more radical movement, futurism, forms Italy's peculiar contribution to modernism. It began as a protest of a band of young writers, painters, and sculptors that their country was nothing more than a vast museum of the past. Unlike the other modernists, the futurists break utterly with the past and look only toward the future; hence their name. The function of painting as they see it is to represent movement and growth, the dynamic forces of modern life. Many of their paintings bear the title "Dynamics" of this or that subject. As their manifesto puts it: "We must make a clean sweep of all hackneyed subjects and express henceforth the whirlwind life of our day, dominated by steel, egotism, feverish activity, and speed." This they often seek to accomplish by means not unlike cubism, combining in the canvas not only what the artist sees but all he knows about the subject. A typical futurist feature is the use of so-called "force lines," certain linear rhythms whose convergence or divergence convey to the artist the dominant thought or emotion he wishes to express. Color is purely arbitrary and may be used to heighten the effect. So may all manner of extraneous objects, which are simply pasted onto the picture. Futurist art indeed is cinematographic, except that it tries to show all at once what the moving-picture unfolds in a given space of time.

The founder of the movement was the poet Marinetti, who wrote its eloquent manifestoes From 1910, when their first exhibition was held at Milan, to 1924, Luigi Russolo represented futurism in its most logical form. Umberto Boccioni, also a sculptor, was an able theorist on æsthetics, whose paintings are often of interesting design. Gino Severini was the illustrator of futurism, Carlo Carrà its most genuine painter, who, unlike the others, uses gay color Giacomo Balla's work is merely pretty. Many of the cubists were influenced by futurism and experimented with it, and vice versa. It had won but few new disciples and seemed destined to decline

Great Britain. The latest effusion of modernism, vorticism, is a product of conservative Great Britain; but before examining it a brief survey of recent British art should be made. Although the chief influence was French, impressionism in its pure form never played a great part in Great Britain. It was rather the modified form of early impressionism, as introduced by the American Whistler during his long residence in London, which prevailed. This was concerned rather with decorative and tonal effects than with the pure study of light, especially in the case of the Glasgow school, out of which came Sir John Lavery (1856–), especially known as a portraitist. The methods of the brilliant Irish painter, Sir William Orpen (1878–), are more akin to impressionism, while Augustus John, a Welshman (1876–), in his powerful characterizations, tends rather to modernism. Mention should also be made of two Americans, active in London, John Singer Sargent (1856–), whose superb technique

combined realism with impressionism, and James J. Shannon (1862–1923), whose illustrative art ranges him properly among British painters. Frank Brangwyn (1867–) represents rather the realistic point of view in his recent superb decorations for the Panama-Pacific Exposition and the Missouri State Capitol. The powerful individual landscapes of P. Wilson Steer show a transition from impressionist to modernist technique. An important figure in the introduction of French post-impressionism into England was Roger Fry, especially by his writings and exquisite connoisseurship. It was mainly the influence of Cézanne and Van Gogh that made itself felt, and the aim was greater plastic effect but with more reference to nature than in France Among the leaders were Spencer F. Gore (1878–1914) and Harold Gilman (1876–1919), who tended more strongly toward modernism, and Charles Ginner.

According to the theory of vorticism, "every concept, every emotion presents itself to the vivid consciousness in some primary form. It belongs to the art of this form." The "vortex" is the artist's faculty through which the emotions and conceptions pass to take concrete shape on canvas. Through it they pass from the general to the concrete. In common with post-impressionists, vorticists do not reject the work of the past; but they agree with the futurists that modern art should reflect present-day industrial civilization, with its dominance by the machine Their paintings are in general geometric and abstract, not unlike cubism. Their aim is to purify painting, and they rely especially on the primary pigment of their art, resembling in this regard the Orphists and synchronists There was nothing essentially new and original in their art, which began in 1913, although several interesting painters had taken it up The founder and principal leader was Wyndham Lewis (1884–), with whom were associated Cuthbert Hamilton, Frederick Etchels, Edward Wadsworth, and William Roberts. The poet of vorticism was an American, Ezra Pound; the sculptor was Henry Gaudier-Brzeska (1891–1915). Vorticism was also a passing phase in the development of C. R. W. Nevinson, who experimented in other styles, including cubism and futurism, only to return in his later work to a more conservative academic art.

During the War the British government made the interesting experiment of employing several painters at the front, and many of their pictures were purchased by the Imperial War Museum. Most of the men employed were actually engaged in warfare and so painted from experience as well as observation. In the choice of artists a wise eclecticism was followed; not only accepted academicians but the most radical groups were included. And it was just these radicals whose art seemed especially adapted to the mechanical character of modern warfare. Among the most prolific of war painters was Sir William Orpen, a major in the army, whose portraits of the chief commanding officers are well known; James McBey, official painter of the army of the Near East; George Clausen, and Augustus John, who painted important commissions for the Canadian government. The futurist technique of C. R. W. Nevinson grappled most successfully with searchlights, shells, and especially aëroplanes. Paul Nash, a visionary post-impressionist, depicted what might be called nature's "dance of death," while vorticism, through its leaders, Wyndham Lewis and William P. Roberts, showed itself well capable of representing the dynamics of modern warfare. All these artists wisely confined themselves to episodes of warfare and did not attempt battle paintings on a grand scale. One of the few good results of the War was the destruction of the old-fashioned battle picture, with its photographic detail, most characteristically seen in the works of Meissonier. The modern battle extending along a front of many miles cannot be painted. The brave array of soldiers has been replaced by the invisible crowds of the trenches. The brightly colored uniforms are now sombre browns, grays, and greens, and the modern soldier is little different in aspect from a workman. (See *War Paintings and Drawings*, by British artists, New York, 1919; and Charles Holme, *The War Depicted by Distinguished British Artists*, in *The International Studio*, 1918).

Germany. The War and the succeeding years levied a heavy death toll on the painters of Germany. At the close of the decade 1914–24, many of the older men were still active in the manner of their earlier work· Edward Gebhardt, religious painter, at Düsseldorf; Arthur Kampf, realist, at Berlin, and Max Liebermann, chief representative of impressionism and leader of the North German secessionists, also in Berlin. In Munich the "Decorative School," led by Franz Stuck, was somewhat akin to modernism in its realistic representation of mystic and allegorical subjects inaugurated by Böcklin. But even this was in 1924 considered conservative and official. Impressionism was an importation which never secured a firm foothold in Germany The native tendency was all toward its antipode, expressionism, for which the soil was well prepared by earlier painters In the early sixteenth century Matthias Grunewald distorted nature to express emotional mysticism much as El Greco did later in Spain. Hans von Marées (1837–87), rebelling against realism and early impressionism, sacrificed the appearance of things to volume and symbolic expression in his noble decorative figures. The Swiss Ferdinand Hodler (1853–1918), a powerful and arbitrary painter, developed in his later works a thoroughgoing expressionism. The influence of Cézanne, Van Gogh, and to a less extent Gauguin was early felt in Germany. But it was an exhibition of the works of the Norwegian Edvard Münch in Berlin which caused the separation of the new movement from the Berlin Secession. Cubism and futurism never obtained an important following, for the principal German tendency was toward forms of purer expressionism. There were two chief groups, at Berlin and Munich. The former group was the less radical. The facile and decorative art of Max Pechstein is more akin to the post-impressionism of other lands, and so is that of Albert Werszgerber and Carl Caspar, all of whom were influenced by Cézanne. Among the members of a more radical group at Berlin called "Die Brücke" were E. L. Kirchner, its founder, a visionary who changes city scenes into fairyland; Erich Heckel, a painter of landscapes romantic in subject; Karl Schmidt-Rottluff, whose tendency is to the colossal and even brutal; and Otto Müller, who prefers rather lyric subjects, painted in tempera.

At Munich, Russian artists contributed to produce the most radical type of expressionism. Foremost among them was Wassily Kandinsky (1886–), a theorist who writes as well as

he paints. He maintains that the rhythm of line and color and of color in juxtaposition to color should be built up architecturally, on fixed principles of construction, as in music. Such an art appeals to the eye independently of all representation, very much as music affects the ear. His pictures are arrangements of abstract line and color without attempt to represent nature. It was he who with a few others seceded from the other post-impressionists to form the group called, from its publication, "Der Blaue Reiter" An important member of this group was Franz Mark (1880–1916), who painted impressions of animals in symbolic color. Others are Heinrich Camperdonck, whose quaint presentations of village and other subjects are essentially imaginary and unreal; Burljuk, a Russian; Baroness Werefkin, Auguste Macke, Gabriel Munter, and Adolf Block. Mention should also be made of Oskar Kokoschka (1866–), an Austrian painter, the most radical of all, less abstract, but equally eccentric, and powerful to the point of brutality; and also of Emil Nolde and Karl Hofer, who paint in a similar vein.

Russia. At the outbreak of the War the Russian school of painting was of great importance and promise. Two factors contributed to make it unlike any other school: stage decoration and peasant art The unparalleled success of the Russian ballet in Europe and America was due as much to its artistic settings as to superb dancing. Of unprecedented power and imagination, these decorations were all the work of Russian painters. Diaghilev, one of the St. Petersburg group, was the pioneer and the greatest painter-impresario in dramatic history. Other great designers were the painters Benois, Golovine, Léon Bakst, Anisfeld, and Larianov. The astonishing freedom of presentation in modern Russian painting and its highly imaginative and decorative qualities were due largely to this training. It was also profoundly affected by the pure, bright color schemes and the picturesque settings and costumes of native peasant art, and on its imaginative side by a vital school of book illustration, particularly of folk tales and subjects The most important reaction against the realism of the Wanderers, chief of whom was Ilya Repin, was the "Mir Iskousstva" (Artistic World) at St. Petersburg. Unlike the former, which painted Russian contemporary life, this group sought subjects in the past, was cosmopolitan in character, and showed French influence Alexander Benois chose the age of Louis XIV in France and that of Elizabeth in Russia, Constantine Somov, the period of 1830; Nicholas Roerich, the Viking age The Moscow group was less learned and more pictorial and chose Russian subjects. Its best-known representatives are Igor Grabar, a *pointilliste*, to-day an influential figure in Soviet Russia, and especially Maliavin, who depicted the gay, animal side of the Russian moujik.

Meanwhile various modernist tendencies had appeared in Russia, and their influence was beginning to be felt. The War put a stop to painting, and during the revolution and the years following most of the artists emigrated from Russia, chiefly because the wealthy class which patronized art had ceased to exist. They migrated to different centres, many joining the large Russian artistic colony in Paris, where they maintained their vital national art. An exhibition of their works was shown at various places in the United States in 1924. The exiles included Fechin, a pupil of Repin, Choukhaiev, Jakolev, Sorin, a rather conservative portraitist, Soudeikin, Stelletski, Burliuk, and especially Boris Grigoriev, whose apocalyptic hallucinations of the Bolshevist revolution and representations of the Russian populace, particularly on their brutal and bestial side, caused a sensation. Best known in the United States was Boris Anisfeld (q.v.), who exhibited repeatedly in New York and elsewhere. In Russia itself the Revolution wrought little damage to existing art works. The more important public museums, like the Hermitage in St. Petersburg and the Tretikov Gallery in Moscow, were greatly enriched by the confiscation of private collections; and the Imperial and other important palaces were transformed into museums. Throughout the length and breadth of the land new museums were established The successful management of public art institutions, which was conceded to be better than ever before, was due to the efforts of Lunacharski, minister of public instruction. One of the daring schemes of Soviet Russia was the establishment of a new proletarian art. Rejecting cubism and futurism as bourgeois products, they acclaimed a new art, "suprematism," which denied not only all representation but even the stylization of natural forms Kandinsky, whose art most approached this norm, was called from Munich to aid in its establishment as well as that of the provincial museums. The only official exhibition of Bolshevist paintings held outside of Russia was at Berlin in 1923. It was about the most modern exhibition ever seen The paintings were usually labeled "constructions" or "compositions" and were built up mathematically. Simplification went even beyond Kandinsky's in the works of such men as Malevitch and Robchenko. Everywhere the search for new forms of art was in evidence. There were also many works of a more conventional character, and the impression of the whole was that of a living and vital art of telling forms and splendid color. Whether such modernist paintings fulfilled the requirements of a Soviet art as enunciated by Kamenev, "an art comprehensible to workmen and to peasants," is another question. In subject it was indeed proletarian, but representation was confined almost to posters and black and whites

Other European Countries. The virile national impressionism of Sweden suffered great loss in the death of its two chief representatives, Anders Zorn (1860–1920) and Carl Larsson (1853–1919). Liliefors was still the chief painter of wild animals, and Gustav Fjaestad was painting fine snow and water scenes in *pointilliste* technique. Zorn's successor in painting the Danecarlian peasantry was Mas Olle, another good portraitist. Sweden had also its due proportion of modernists, such as Axel Törneman; Gabriel Strandberg, who painted the outcasts of Stockholm; John Bauer, whose quaint imagination found expression in fairy tales; and Ossian Elgström, with a touch of the Laplander.

The dominant figure in Norwegian art until his death was Edvard Münch, who was also something of a modernist, influenced somewhat by Cézanne. His successor was Ludvig Karsten. The foremost talent of the neo-impressionist group was Hendric Lund, while Sören Ansorger was known for his nudes. Norway also had its

ERNEST LAWSON—"WINTER SCENE"

expressionist cult, influenced chiefly by Matisse; among its foremost representatives were Hendrik Sorensen and Axel Revold. The painting of Denmark was more conservative, although modernism had its representatives.

Belgium and Holland were strongly affected by the new movement, especially Holland. In a country which had in its art been so closely attached to the past and realistic in character, it was astonishing to what extent the new movement had spread. Although Van Gogh, one of its chief pioneers, was a Dutchman, his last and most radical works were wrought in France, and his influence entered Holland quite late; nevertheless it was powerful Among the chief representatives of the new development were Jan Toorup, Thorn-Prikker, Willem van Konijnburg, J. J. Isaakson, and Jan Sluyters.

The death of Sorolla in 1923 removed the foremost representative of impressionism in Spain. The most interesting manifestation of contemporary Spanish painting was the nationalist school of the North, founded by Zuloaga and ably seconded by numerous followers, including the Zubiaurre brothers. In subject and treatment it was thoroughly national and continued the traditions of El Greco and Goya. It was decorative in style, with heavy outlines, rich, sombre color and vivacious expression.

United States. During the years 1914–24, American painting followed a normal development, less changed by recent radical tendencies than other important schools It was also less affected by the War. During the early years of the conflict artistic production was in no wise curtailed, and it was not until after the entry of the United States in 1917 that there was any perceptible diminution in the output. There was comparatively little painting of war subjects. The death toll among older American artists during the period was heavy. To mention a few of the most prominent, William Merritt Chase and Thomas Eakins died in 1916; Albert Ryder and Carroll Beckwith in 1917; Henry Golden Dearth in 1918; C. Y. Turner, Frank Duveneck (q.v.), Ralph A. Blakelock, James Alden Weir, and Kenyon Cox in 1919; Abbott H. Thayer and J. Francis Murphy in 1921; Hamilton Easter Field in 1922, Elihu Vedder, Joseph R. Decamp, Max Bohm, Paul Cornoyer, and George W. Maynard in 1923. The former radicals of the Society of American Artists were the conservatives of the day, and even those of the next younger generation were now among the elect. All these continued their work, and many figured at the exhibitions and as medalists, such as Douglas Volk, Irving Wiles, Dewitt Lockwood, Cecilia Beaux, Mary Cassatt, Frank Benson, and Edmund C. Tarbell, among portraitists and figure painters; Waugh, Woodbury, and Emil Carlsen as marine painters, the last especially taking many medals in the later years for marines and still life; Edward Redfield, Elmer Schofield, and Gardner Symonds, as painters of winter subjects; and Childe Hassam (q.v.), the most pronounced impressionist among the older men.

Arthur B. Davies, (q.v.), known as leader of the modernists, continued his idyllic subjects with no end of variety and charm. In the years following 1913 he passed through a cubist period, which added volume and construction to his rather decorative art. So also did Robert Henri (q.v.), whose virile production and influence continued almost undiminished. Of his former pupils, George Bellows achieved great distinction through his bold and powerful portrait and figure subjects, which won medal after medal. Other important members of this group were George Luks, William Glackens, John Sloan, and Eugene Speicher. Powerful alike in characterization and technique are the portraits of Leopold Seiffert of Philadelphia. Other portraitists known also as figure painters were John C. Johansen, Karl Anderson, Joseph Pearson, Jean M. Lane, Louis Betts, Leon Kroll, and Henry R. Rittenberg, a fine painter of still life. In the first rank of American figure painters was Charles W. Hawthorne (q.v.), who paints the inner life with beautiful and highly characteristic color. Of pronounced impressionistic technique among the younger men were Richard Miller, Frederick Frieseke, and James Weiland. Mention should also be made of a characteristic branch of American painting, i.e. Indian subjects. The Taos group of painters, so called from their place of residence in New Mexico, in recent years painted many interesting representations of Indians, chiefly of the Southwest. Among their number were Julius Rolshoven, Carl Rungius, Walter Ufer, Ernest L. Blumenschein, Edward Potthast, and O. E. Berninghaus. Their work was generally impressionistic or realistic in character and of fine illustrative quality. In this connection the landscapes of Albert Groll (q.v), the painter of the mesas and the desert landscape, should be recorded. Among painters devoted chiefly to decorative work were Violet Oakley, whose mural decorations of the Pennsylvania State House at Harrisburg attracted wide attention; Robert Chanler, whose specialty was screens showing Chinese influence but independent and modernistic in conception and execution; Hugo Ballin, and Arthur Crisp. Landscape painters among the younger generation were many. One of the strongest was Ernest Lawson, whose winter scenes are particularly fine. These subjects were preferred also by John Folinsbee and Charles Rosen, who in the later years became modernistic in tendency. Jonas Lie was painting landscapes as well as great industrial scenes, and Gifford Beal brightly colored landscapes, while Guy Wiggins was more tonal. Among the marine painters Paul Dougherty painted the Maine coast and William Ritschel the Pacific, while Hayley Lever was known especially for his boats, though he later painted other varieties of landscape with equal ability

After the entry of the United States into the War, there was considerable activity among American painters in designing posters, especially in aid of the government loans. Many war pictures, intended to fire patriotic endeavor and represent important episodes of the War, were also painted. Among the most interesting of these was a series depicting Fifth Avenue in war time by Childe Hassam. An important series of war portraits, authorized by the National Art Commission and paid for by subscriptions in the principal cities of the United States, was presented to the National Museum at Washington. Exhibited at the Metropolitan Museum in New York City in 1921, they were all by painters of conservative tendencies. The most important was a large picture, "Signing of the Treaty of Versailles," by John C. Johansen. The remainder were portraits of the chief war celebrities of all the Allies by Cecilia Beaux, Jean McLane, Joseph

expressionist cult, influenced chiefly by Matisse; among its foremost representatives were Hendrik Sorensen and Axel Revold. The painting of Denmark was more conservative, although modernism had its representatives.

Belgium and Holland were strongly affected by the new movement, especially Holland. In a country which had in its art been so closely attached to the past and realistic in character, it was astonishing to what extent the new movement had spread. Although Van Gogh, one of its chief pioneers, was a Dutchman, his last and most radical works were wrought in France, and his influence entered Holland quite late; nevertheless it was powerful Among the chief representatives of the new development were Jan Toorup, Thorn Prikker, Willem van Konijnburg, J. J. Isaakson, and Jan Sluyters.

The death of Sorolla in 1923 removed the foremost representative of impressionism in Spain. The most interesting manifestation of contemporary Spanish painting was the nationalist school of the North, founded by Zuloaga and ably seconded by numerous followers, including the Zubiaurre brothers. In subject and treatment it was thoroughly national and continued the traditions of El Greco and Goya. It was decorative in style, with heavy outlines, rich, sombre color and vivacious expression.

United States. During the years 1914–24, American painting followed a normal development, less changed by recent radical tendencies than other important schools It was also less affected by the War. During the early years of the conflict artistic production was in no wise curtailed, and it was not until after the entry of the United States in 1917 that there was any perceptible diminution in the output. There was comparatively little painting of war subjects. The death toll among older American artists during the period was heavy. To mention a few of the most prominent, William Merritt Chase and Thomas Eakins died in 1916; Albert Ryder and Carroll Beckwith in 1917; Henry Golden Dearth in 1918; C. Y. Turner, Frank Duveneck (q.v.), Ralph A. Blakelock, James Alden Weir, and Kenyon Cox in 1919; Abbott H. Thayer and J Francis Murphy in 1921; Hamilton Easter Field in 1922, Elihu Vedder, Joseph R. Decamp, Max Bohm, Paul Cornoyer, and George W. Maynard in 1923. The former radicals of the Society of American Artists were the conservatives of the day, and even those of the next younger generation were now among the elect. All these continued their work, and many figured at the exhibitions and as medalists, such as Douglas Volk, Irving Wiles, Dewitt Lockwood, Cecilia Beaux, Mary Cassatt, Frank Benson, and Edmund C. Tarbell, among portraitists and figure painters; Waugh, Woodbury, and Emil Carlsen as marine painters, the last especially taking many medals in the later years for marines and still life; Edward Redfield, Elmer Schofield, and Gardner Symonds, as painters of winter subjects; and Childe Hassam (q.v.), the most pronounced impressionist among the older men.

Arthur B. Davies, (q.v.), known as leader of the modernists, continued his idyllic subjects with no end of variety and charm. In the years following 1913 he passed through a cubist period, which added volume and construction to his rather decorative art. So also did Robert Henri (q.v.), whose virile production and influence continued almost undiminished. Of his former pupils, George Bellows achieved great distinction through his bold and powerful portrait and figure subjects, which won medal after medal. Other important members of this group were George Luks, William Glackens, John Sloan, and Eugene Speicher. Powerful alike in characterization and technique are the portraits of Leopold Seiffert of Philadelphia. Other portraitists known also as figure painters were John C. Johansen, Karl Anderson, Joseph Pearson, Jean M. Lane, Louis Betts, Leon Kroll, and Henry R. Rittenberg, a fine painter of still life. In the first rank of American figure painters was Charles W. Hawthorne (q.v.), who paints the inner life with beautiful and highly characteristic color. Of pronounced impressionistic technique among the younger men were Richard Miller, Frederick Frieseke, and James Weiland. Mention should also be made of a characteristic branch of American painting, i.e. Indian subjects. The Taos group of painters, so called from their place of residence in New Mexico, in recent years painted many interesting representations of Indians, chiefly of the Southwest. Among their number were Julius Rolshoven, Carl Rungius, Walter Ufer, Ernest L. Blumenschein, Edward Potthast, and O. E. Berninghaus. Their work was generally impressionistic or realistic in character and of fine illustrative quality. In this connection the landscapes of Albert Groll (q.v), the painter of the mesas and the desert landscape, should be recorded. Among painters devoted chiefly to decorative work were Violet Oakley, whose mural decorations of the Pennsylvania State House at Harrisburg attracted wide attention; Robert Chanler, whose specialty was screens showing Chinese influence but independent and modernistic in conception and execution; Hugo Ballin, and Arthur Crisp. Landscape painters among the younger generation were many. One of the strongest was Ernest Lawson, whose winter scenes are particularly fine These subjects were preferred also by John Folinsbee and Charles Rosen, who in the later years became modernistic in tendency. Jonas Lie was painting landscapes as well as great industrial scenes, and Gifford Beal brightly colored landscapes, while Guy Wiggins was more tonal. Among the marine painters Paul Dougherty painted the Maine coast and William Ritschel the Pacific, while Hayley Lever was known especially for his boats, though he later painted other varieties of landscape with equal ability

After the entry of the United States into the War, there was considerable activity among American painters in designing posters, especially in aid of the government loans. Many war pictures, intended to fire patriotic endeavor and represent important episodes of the War, were also painted. Among the most interesting of these was a series depicting Fifth Avenue in war time by Childe Hassam. An important series of war portraits, authorized by the National Art Commission and paid for by subscriptions in the principal cities of the United States, was presented to the National Museum at Washington. Exhibited at the Metropolitan Museum in New York City in 1921, they were all by painters of conservative tendencies. The most important was a large picture, "Signing of the Treaty of Versailles," by John C. Johansen. The remainder were portraits of the chief war celebrities of all the Allies by Cecilia Beaux, Jean McLane, Joseph

Decamp, Charles Hopkinson, Edmund C. Tarbell, Douglas Volk, and Irving R. Wiles. Another important series consisting of portraits of Americans prominently identified with the War, and also presented to the National Museum, was donated by a Norwegian, in gratitude for his own financial benefits during the War. Several of these were painted by J. H. von Rehling-Quistgaard, an American painter of Danish extraction, the remainder by artists chosen by a committee of experts.

The brilliant success with which modernism was launched in New York City and Chicago in 1913 gave great promise for the future of the movement. But this promise was not realized. Factional differences soon dissolved the International Association of Painters and Sculptors, which had organized the exhibition; and beyond separate exhibitions of smaller groups, little was heard of the new painting. In 1917 the Society of Independent Artists was founded with unrestricted membership to any one paying the nominal initiation fee. Each member is entitled to send a limited number of paintings or sculptures to the annual exhibition. As there was no jury of acceptance and the paintings were hung in alphabetical order of authorship, these exhibitions presented a strange medley of pictures excellent and worthless, academic and modernist. Nevertheless they formed an open forum, uncontrolled by official juries, for the radicals. Their most interesting feature in the later years was the work of a group of native Indian artists, without technical training and therefore modernist enough. Their chief subjects were Indian ceremonial dances, painted in pure, bright water-color. Modernist paintings were constantly on exhibition in numerous private galleries, and in New York they found a special home in the Société Anonyme's Museum of Modern Art, founded for this purpose. Among painters of distinctive modernist tendencies were Rockwell Kent (q.v.), especially in his Labrador subjects; Kenneth Hayes Miller, of much influence as a teacher; Maurice Sterne and Max Weber, both admirable teachers; Andrew Dasburg, a follower of Cézanne, Samuel Halpert and Henry McFee; Walter Pach, a cubist still-life painter; Abraham Walkowitz, William Zorach, and most important of all, John Marin, whose admirable landscapes and water-colors were accepted in all circles. Of more radical tendencies were John Covert, A S. Baylinson, Marsden Hartley, Man Ray, S. McDonald Wright, Morgan Russell, Jay Van Everen, James Daugherty, Henry Fitch Taylor, and Katherine S. Dreier, who is chiefly known as a writer and the founder of the Société Anonyme. The foremost representative of futurism in the United States was Joseph Stella, who with rare ability depicted Brooklyn Bridge, the subway, and other characteristic features of New York.

PALACHE, Charles (1869–). An American mineralogist, born at San Francisco, Cal., and educated at the University of California. In 1896 he became instructor in mineralogy at Harvard, where he has since remained, attaining professional rank in 1912. His many scientific papers related chiefly to mineralogy and particularly to the crystallography and paragenesis of American minerals.

PALÆONTOLOGY. See Anthropology.

PALÉOLOGUE, Maurice Georges (1859–). A French diplomat and man of letters, educated at the Lycée Henri IV in Paris. He entered the French diplomatic service, was secretary at Tangiers and at Rome, and was sent on special missions to Germany, Korea, and Belgium. He was assistant director of the Foreign Office and was appointed ambassador to Russia; this post he held during the War and afterward returned to the Quai d'Orsay On the resignation of Berthellot as director general of the Foreign Office, Paléologue succeeded him. As a writer of varied interests, Paléologue published essays, biographies, memoirs, and archæological studies. His memoirs on *La Russie des Czars pendant la Grande Guerre* (1921) throw a vivid light on the decomposition of the Russian Empire under the stress of the War. His other works include *Vauvenargues*, crowned by the French Academy (1889), *Alfred de Vigny* (1892); *L'Art Chinois* (1888), *Profil de Femmes* (1895); *Sur les Runes* (1897); *Le Calice* (1901); *Rome: Impressions d'Histoire et d'Art* (1902); *La Cravache* (1904), and *Le Point d'Honneur* (1907).

PALESTINE. A British mandate territory and the Jewish national homeland, since July 1, 1920, under a civil administration It includes that part of historic Palestine which lies to the west of the Jordan and which before the War was a vilayet of the Turkish province of Syria. Area, estimated at 9000 square miles. The population, according to the census of Oct 23, 1922, was 757,182, comprising 590,890 Moslems, 83,794 Jews, 73,020 Christians, 7028 Druses, 163 Samaritans, and 265 Bahais. The capital, Jerusalem, had a population of 62,578 Other principal cities are (population in parentheses): Jaffa (47,709), Haifa (24,634), Gaza (17,480), Hebron (16,577), Nablus (15,947). Jewish immigration, which was resumed after the War, totaled 27,000 by Mar. 1, 1923. Jaffa was the principal port of entry; the immigrants came largely from Poland, Russia, Morocco, Austria, Syria, Bulgaria, Rumania, Egypt, Hungary, etc Moslem interests were represented by a Supreme Moslem Council; Jewish interests were the concern of the Palestine Zionist executive.

Jewish Colonies. These colonies, totaling 80 in number, were grouped in four districts, viz. Judea (26), Samaria (17), Lower Galilee (27), Upper Galilee (10). The colony possesses schools, synagogues, public libraries, hospitals, and baths. By the end of 1923 the total population of these colonies numbered more than 20,000 and the lands which they worked included some 160,000 acres. The colonies were owned or established by the Jewish National Fund, the Palestine Land Development Company, Baron Edmund de Rothschild, and the Jewish Colonization Association. Tel Aviv, near Java,

founded by Jewish colonists in 1909, had a population estimated at 15,000 to 20,000. Its real estate had an assessed value of $12,000,000. In June, 1923, a £E75,000 loan for municipal improvements was floated in New York.

Education. In 1924 there were the following government schools: 45 town schools, 267 village schools. The Christian and Jewish children attended non-government schools. Christian schools numbered 163 (13,500 pupils), the Jewish schools, 175 (18,000 pupils). There were Jewish high schools at Jerusalem and Jaffa, three teachers' training colleges, schools of music at Jerusalem, Jaffa, and Haifa, and a technical college at Haifa. In all these, Hebrew was the medium of instruction. The majority of the non-government schools were receiving state aid

Industry. The productive portion of the country is the narrow strip of plain running along the Mediterranean from Gaza to Haifa. The richest region, in the neighborhood of Jaffa, was developed by Jewish colonists who carried orange and lemon cultivation here to a high degree of production. The acreage of the Jewish plantations included 3750 acres of vineyards, 8456 acres of almond groves, 3330 acres of orange groves, and 1500 acres of eucalyptus In 1922–23, crop production was: wheat, 79,798 tons; barley, 32,079 tons, durra, 21,555 tons; olives, 14,000 tons; lentils, 3908 tons There was in the country the following live stock: 262,000 sheep, 483,000 goats, 19,000 camels, 12,000 buffaloes. Under the direction of an agriculture department, expert advice was rendered in matters pertaining to plant diseases, fisheries, forestry, meteorology, etc. Mineral resources included sulphur, iron, coal, salt, limestone, sandstone, and gypsum. The government was applying itself to reforestation and the reclaiming of the sand-dunes. Trade, carried on largely through the ports of Jaffa, Haifa, and Gaza, continued to show an unfavorable balance over the period 1919–23. Imports for 1919–20 and 1922–23 totaled £E4,191,060 and £E5,428,146; exports for the same years were £E733,443 and £E1,376,649. The chief articles of export were oranges, soap, melons, wine, apricot paste, and almonds; the chief articles of import were cottons, cigarettes, sugar, petroleum, and rice The principal countries of origin in 1922–23 were Great Britain and the United States, with Egypt, France, Italy, and India next in order Experts went to Egypt, the United States, and Great Britain.

Finance. For the year 1923–24, receipts were estimated at £E1,787,200, divided into £E535,000 customs, £E130,000 house and land tax, £E40,000 animal tax, £E200,000 tithes, £E43,000 stamp duties, £E48,000 excise duties, £E42,000 land registry fees, £E415,000 railways, £E112,900 posts and telegraphs. Generally, the budgets balanced in the years following the War

Railways. There were in operation in 1923 604 miles of railways, of which 479 miles were being operated by the government of Palestine, and 125 miles by the Palestine Railways for the British Air Ministry. The most important lines were the Kantara-Haifa (259.5 miles), Jaffa-Jerusalem (54.2 miles), Rafa-Beersheba (37 miles).

Government. By the constitution of Sept. 1, 1922, executive power was vested in the High Commissioner, appointed by Great Britain. A legislative council, of 10 official members and 12 unofficial, of which at least two were to be Christians and two Jews, was given the power to legislate for the mandate territory. The High Commissioner might veto any ordinance, or the British government might disallow it. By 1924 the Legislative Council had not yet been convened because of the abstention of the Arabs from the polls. The Jews chose an elected assembly, which in turn appointed a national committee to treat with the Palestine government. The British mandate for Palestine was approved by the League of Nations Council on July 24, 1922, and was promulgated on Sept 29, 1923. On July 1, 1920, Sir Herbert L. Samuel became High Commissioner. See also JEWS AND JUDAISM; ZIONISM

History. The home of the ancient Jewish kingdom, Holy Land of the Christians, which had been subject to Mohammedan rule since the failure of mediæval crusades to establish an enduring Christian government, entered upon a new phase of its checkered history in 1917, when it was wrested from the Ottoman Empire by British and Arab invaders. That Palestine would be among the spoils to be divided by the victors had been anticipated By the secret Sykes-Picot Agreement of May 16, 1916, France and England had agreed that the ports of Haifa and Akka should be assigned to Britain, and that Palestine as a whole should be "separated from Turkish territory and subjected to a special régime to be determined by agreement between Russia, France, and England." Not content with this somewhat ambiguous pledge, the British government skillfully manœuvred to obtain sole jurisdiction over the region. Of fundamental importance in this British move was the celebrated Balfour Declaration of Nov. 2, 1917. This highly important utterance pledged the British government to "establishment in Palestine of a National Home for the Jewish People, . . . it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of existing non-Jewish communities in Palestine or the rights and the political status enjoyed by Jews in any other country." The British policy set forth in the Declaration proceeded from two fundamental motives. As a war measure the Declaration was calculated to win the international Jewry to the cause of the Entente Of much greater importance, however, was the knowledge that Palestine had been from time immemorial the connecting link between Mesopotamia and Egypt and that it is the strategic point which potentially controls the road to India by land and by sea. The establishment of a Zionist state under British protection gave Great Britain this priceless and coveted possession, and, while it cemented the foundations of the British Empire, homage was done at the same time thereby to the Allied slogan of "self-determination of nations." The British project, a superb combination of altruism and imperial *Realpolitik*, had unfortunately some serious drawbacks which had been left out of consideration, namely the fact that modern Palestine was not a Jewish country, and secondly the ever-growing opposition of Arab nationalism, of which Great Britain itself had been the chief instigator. Moreover, the British had overlooked a very important factor. Palestine is not only the natural link between Mesopotamia to the northeast and Egypt to the southwest, but it also lies at the mouth of the great Arab reservoir of man power to the south,

whence the Arabs had poured forth since the earliest days into the neighboring regions. The attempt to close this outlet by an artificial Jewish state under the protection of the British Empire was naturally fraught with danger, and all the more so since the Balfour Declaration conflicted, in the opinion of the Arabs at any rate, with the British commitments to the Sherif of Mecca in 1914 and 1915.

When Palestine was wrested from the Turks it was in an exhausted condition. The land was untilled and production had fallen to a low ebb. The population had decreased considerably during the War and the whole system of civil government had fallen to pieces. Immediately after the occupation the British set up a military administration which after much effort succeeded in bringing about an improvement. Gradually cultivation was restored and normal life began to return. But much more had to be accomplished. Palestine, a country with a variety of soils and climates, had always been undeveloped and underpopulated under Turkish rule, and the British aim was to bring out the great latent fertility of the country. As for the Jewish population, which had been very small during the 19th century and had risen to about 100,000 before the War, it formed in 1918 only a fraction of a total population which was predominantly Arabic-speaking and, if not entirely Arab in racial composition, at least claimed to be Arab.

On Sept. 27, 1919, Zionism, which had been a force in the Jewish world for some time before the War, pleaded its case before the Supreme Council and asked for the recognition of the historic title of the Jews to Palestine and for the right to reëstablish there a national home. Furthermore, they requested that the sovereign possession of Palestine be vested in the League of Nations and that Great Britain as a mandatory of the League be empowered to govern the country. After a long delay, during which the first manifestations of Arab national sentiment against this proposed settlement occurred, the Supreme Council at the Conference of San Remo, Apr. 25, 1920, granted the mandate to Great Britain and in July of the same year the military administration was replaced by a civil régime under Sir Herbert Samuel, a prominent English Jew, as High Commissioner. In October, 1920, an Advisory Council was set up, consisting of ten officials of the administration, four Moslems, three Christians and three Jews. Much attention was given to local government and 22 municipalities and 14 local village councils were established. As for education, the Turkish system was reorganized and extended The Moslem children attended the government schools where Arabic was the principal medium of instruction, but most of the Jewish children went to schools conducted by the Zionist Organization and the Christian children attended the schools maintained by the ecclesiastical and charitable bodies. Considerable progress was made in the direction of public health and sanitation, which had been very low under the Turkish régime. The law of the land was in substance that of the Turkish Code. The abolition of the Capitulations, which had been decreed by Turkey at the outbreak of the War, was maintained, except in the case of the United States. Foreigners were tried by a British magistrate or by a court with a majority of British judges. Public security was maintained by a police force and gendarmerie recruited from all sections of the population.

The Zionist claims to Palestine were recognized in the Peace Treaty of Sèvres, and the Balfour Declaration was incorporated in the text of that document After much contention between the English and the French over the boundaries between Palestine and Syria a convention defining these was signed on Dec. 23, 1920. A final agreement relative thereto was concluded on Feb. 3, 1922. The draft for the Palestine mandate was submitted to the League of Nations on Dec. 7, 1920, and approved in July, 1922. Its promulgation was delayed, however, due to the opposition of the Italians to the French Syrian mandate with which the Palestine mandate was bound up The mandate realized practically all the demands of the Zionists at the Paris Conference in 1919. The region to the east, known as Transjordania (q.v.), was under the authority of the High Commissioner, but enjoyed a special status and was not included in the area of the Jewish National Home. Subsequently Abdullah, son of the King of the Hedjaz, was established as Emir of this region.

Meanwhile the nationalist sentiment of the Arab majority, which had received a powerful stimulus in consequence of the events of the War, chafed against the arrangements for a Jewish National Home. Serious riots took place in Jerusalem in April, 1920. In February, 1921, a congress of the Palestinian Arabs was held, at which protests were registered against the Balfour Declaration and demands were made for a national government and a legislative assembly to be elected by the Arabic-speaking population residing in the country before the War. A permanent committee was set up whose purpose it was to work in this direction. On May 1, 1921, the extreme anti-Jewish feeling manifested itself in widespread disturbances in the course of which military force had to be employed to restore peace. This led to a thorough investigation of the affairs in Palestine by a commission, in the report of which the Arab grievances were analyzed and both sides were exhorted to refrain from all expression of extremism and to work in a spirit of moderation for a lasting understanding and for the development of the country. But the report upheld the policy of the Balfour Declaration and said nothing which could serve to allay the apprehensions of the Arabs In order to settle the grave difficulties, the British government drafted a constitution for Palestine, the chief provisions of which were given to the press in February, 1922. According to this document supreme executive authority was to be vested in the High Commissioner, who was to be assisted by an Executive Council. Provision was made for the establishment of a Legislative Council, to consist of 10 officials and 12 unofficial members, the latter to be elected under a system of primary and secondary elections. The acts of the Legislative Council were to require the assent of the High Commissioner or in certain cases that of the British government. In regard to the judicial system, provision was made for the setting up of separate Moslem, Christian, and Jewish religious courts with English, Arabic, and Hebrew as the official languages. The British government was to be the arbiter in complaints regarding nonfulfillment of the terms of the mandate, but the procedure in such cases was to be prescribed by the League of Nations.

After the publication of the draft of the Constitution, a delegation, claiming to represent the entire Christian-Moslem population of Palestine, went to England to protest against the provisions. The chief complaint of the Arabs centred on the limited self-government which was to be bestowed on Palestine under the Constitution and it was claimed that such restriction was contrary to Article 22 of the Covenant of the League of Nations. The reply of the British government made clear that a different course and in particular the establishment of a national government was not open to Great Britain since this would have involved an abandonment of the Balfour Declaration and the pledge regarding a Jewish National Home. The British, in fact, could not repudiate the policy of the Balfour Declaration if they wished to retain their hold on Palestine, the possession of which was so invaluable for the safeguarding of the British Empire. In view of the powerful possibilities inherent in Arab nationalism, it was doubtful indeed whether an Arab Palestine would have been as pliable an instrument in British hands as a Jewish Palestine was. The Palestinian Arabs, on the other hand, responding to the virile movement of Arab nationalism, could not very well recede from their position of opposition to Zionist rule in view of the fact that the Jews constituted only a fraction of the total population of Palestine. According to the figures of the official census of 1922, which divided the population along religious lines, the total population in that year was 755,000, composed as follows: Moslems, 589,564; Christians, 73,026; Jews, 83,794; Druses, 7028; other religions, 1446. Most of the Christians spoke Arabic, were racially akin to the Arabs, and sided with the latter against the Jews. A serious consideration in this connection was the fact that a Zionist Palestine was a direct challenge to that still obscure but nevertheless potent revolt against Western civilization which was slowly crystallizing in post-war Pan-Islamism. Arab nationalism could be regarded in many aspects as the advance guard of this movement which involved a new form of the Moslem faith and as such stood for a social and cultural conception which was opposed to the West.

A lengthy declaration of the British policy, issued in July, 1922, attempted to allay the apprehensions of the Arabs. It referred to these as "partly based upon exaggerated interpretations of the meaning . . . of a Jewish National Home in Palestine" and stated at the same time that the Balfour Declaration was "not susceptible of change." While the Zionist Organization declared itself satisfied with this declaration, the Arab delegation refused to accept it and returned home in the fall of 1922. Thereupon the Arabs decided to boycott the elections for the Legislative Council which were held in the beginning of 1923. Since this boycott precluded the creation of a legislative body representative of the majority of the people, the British government suspended for the time being the part of the Constitution dealing with the Legislative Council and restored the Advisory Council which was to have been abandoned under the Constitution. This new Advisory Council, which was to consist of eight Moslems, two Christian Arabs, and two Jews, was, however, impossible of formation, because, under pressure from the Nationalists and particularly from the Arab delegation which had recently returned from London, most of the prospective members refused to serve on it. Meanwhile Palestine had become filled with rumors of an agreement between Great Britain and the King of the Hedjaz under which Palestine was to become part of the domain of the latter. In spite of the Palestine government's denial of the truth of these rumors, considerable excitement ensued and the Sixth Palestine Arab Congress, which met in June, 1923, found it necessary, in view of the conflicting opinions prevailing among Moslems, Christians, and Jews, to declare that it was opposed to any such course. After the Congress, another delegation was sent to London, which soon returned, its mission having been a complete failure. The confirmation in 1923 by the League of Nations of the British mandate for Palestine and the consequent legalization of the existing status failed to impress the Arab population, which continued its intransigent attitude. The government's offer for the creation of an Arab Agency similar to the Jewish Agency meeting the adamant opposition of the Arabs, the government proceeded to form an Advisory Council consisting of officials only. At the same time a new moderate Arab Liberal party sprang into existence, which, in spite of its opposition to the old party, failed to evince much moderation in its programme. The year 1923 was marked by a final settlement of the frontiers of Palestine and Syria through agreement between the mandatory powers and by Great Britain's recognition of Abdullah's Transjordanian government as an independent state, although Transjordania (q.v.) remained in fact a British protectorate and was subsequently protected, during an uprising, by British military force. See also ARABIA; CALIPHATE; PAN-ISLAMISM. TRANSJORDANIA.

PALMER, A(LEXANDER) MITCHELL (1872–). An American lawyer and public official, born in Moosehead, Pa., and educated at Swarthmore College. After studying law, he was admitted to the bar and practiced for several years in Stroudsburg, Pa. He was a member of Congress from 1909 to 1915 and in the latter year was appointed judge of the United States Court of Claims. This post he resigned after a few months. He was appointed Alien Property Custodian in 1917 and served until 1919, when he was appointed Attorney General of the United States in President Wilson's Cabinet. He was prominently mentioned as a presidential candidate in 1920. Following his retirement from political life, he resumed the practice of law.

PALMER, FREDERICK (1873–). An American author and war correspondent, born at Pleasantville, Pa., and educated at Allegheny College. From 1895 to 1897 he was a newspaper correspondent in London. As a war correspondent he witnessed the Greek War in 1897. During the Spanish-American War he was in the Philippines and accompanied the expedition for the relief of Peking, China, in 1900. Other campaigns in which he was correspondent were those in Central America and in Macedonia in 1903. He was also a correspondent in the Russo-Japanese War and accompanied the American Battleship Fleet in its round-the-world cruise (1907–08). He investigated conditions in Central America in 1908–09 and witnessed the Turkish revolution in 1909 and the Balkan War of 1912. From 1914 to 1916 he was accredited correspondent of the American press with the British army and fleet and in 1917 was commis-

sioned major and lieutenant-colonel in the United States Army Signal Reserve Corps. His writings include *Going to War in Greece* (1897); *The Ways of the Service* (1901); *Central America and Its Problems* (1910); *My Year of the War* (1915); *My Second Year of the War* (1917); *America in France* (1918); *Our Greatest Battle* (1919); and *The Folly of Nations* (1921).

PALMGREN, SELIM (1878–). A Finnish composer, born at Björneborg. After graduating from the Helsingfors Conservatory he continued his pianistic studies in Berlin with Ansorge, Berger, and Busoni. He was conductor of a choral society in Helsingfors from 1902 to 1904 and in 1909–12 conducted the orchestral concerts of the Music Society in Abo. He has appeared extensively as a concert pianist and guest conductor in Finland and Scandinavia. In 1909 he married the famous Finnish soprano, Maikki Pakarinen. In 1921–22 both artists made a very successful tour of the United States. Palmgren's compositions are original and beautiful music and yet conform to established standards. He wrote two operas, *Daniel Hjort* (Helsingfors, 1910) and *Peter Schlemihl* (not produced); a symphonic poem, *Floden;* incidental music to *Tukkimo;* three concertos for piano and orchestra, and songs and male choruses. Special mention should be made of his compositions for piano solo, which show his genius at its best and deserve to rank with similar works of Grieg.

PAN-AFRICAN MOVEMENT. See AFRICA.

PANAMA. A Central American country situated between Colombia and Costa Rica. Area, 32,380 square miles; population, census of 1923, 446,098. a gain of 29 per cent over 1910. The Canal Zone (not included in the above) had 71,682 inhabitants in 1911 and 22,858 in 1920. Panama, the capital, had, in 1920, 59,458 (37,505 in 1911); Colon, 31,203 (17,748 in 1911). In the 339 government public schools, 35,255 children were in attendance in 1922. In 1911, a national college, the Instituto Nacional, was erected

Industry and Trade. Only a small area continued to be cultivated. The leading crops were: bananas, coffee, cacao, caoutchouc. Sugar was beginning to take on importance, the production in 1922 being 6,055,700 pounds, and consumption, 8,000,000. Tobacco, too, was becoming prominent. As a result of the extensive cattle-rearing, the export of hides was large. In 1905, there were 65,000 cattle; 200,000 in 1916, and 300,000 in 1922. The trade, during the decade 1914–24, showed little increase except for 1920, which was the country's most prosperous year. Imports totaled $17,561,994, almost 50 per cent greater than those of 1913. But because of the ensuing depression, the imports dropped to $11,372,370 for 1921, and $10,220,168 for 1922. In 1912, the United States supplied 53.7 per cent of the imports, Great Britain 24.1 per cent, Germany 10.9 per cent. In 1920, the proportions were: United States, 76 per cent; Great Britain, 6.3 per cent. In 1922, they were: United States, 68.4 per cent; Great Britain, 9.2 per cent. Exports, by comparison, were worth much less. In 1913 they totaled $5,383,028; for 1920, $3,552,166; for 1921, $2,495,407, and for 1922, $2,487,478. In 1921, the United States took 93 per cent of the total value, and in 1922, 87 per cent. Bananas annually accounted for more than half the exports. Others were: coconuts, balata, hides, gum, sugar. Principal imports were: cotton, iron, steel, flour. All the international commerce of Panama moved through the ports of Colon, Panama City, and Cristobal and Balboa in the Canal Zone.

Finance. The finances, reorganized by an American fiscal agent, were based on a biennial budget. For the period 1913 and 1914 the budget balanced at $7,682,428. For 1922, revenues were $5,299,999 and expenditures $6,900,217. The foreign debt at the beginning of 1922 was $2,671,680. In 1923 a loan of $4,500,000 was floated in New York for highway construction and the development of the country's resources. This was secured by the income from the $6,000,000 which Panama had invested in New York City real estate after the Canal Zone purchase.

History. The constitution, as amended Dec. 26, 1918, provides for a president directly elected and ineligible as his own successor, and a directly elected chamber of deputies. The provincial governors are also to be popularly chosen. Presidents for the period were: 1912–16, Belisario Porras; 1916–20, Ramon M. Valdez (died), Ciro L. Urriola; 1920–24, Belisario Porras. By the treaty between Colombia and the United States (finally ratified in 1921) the former recognized Panama's independence. Panama, having been an Associated Power in the War, became an original member of the League of Nations Panama's continued refusal to accept the White decision (1914) in respect to her boundary dispute with Costa Rica led troops of the latter to seize the town of Coto on Feb. 28, 1921. The danger of general hostilities caused the United States to offer its good offices, which both sides accepted on March 9. The United States insisted that the White award be accepted, and Panama, still protesting, was compelled to withdraw her troops from Coto. In 1922, the Hay-Bunau-Varilla treaty of 1903 with the United States was the subject of discussion in Washington, the purpose being the removal of those causes of friction under which Panama had chafed for two decades. These included property valuations for the Canal Zone, a free port, docking privileges, etc. In 1924, negotiations were begun for the revision of the Taft agreements of 1924 regarding the Canal Zone

PANAMA CANAL. This great engineering work was opened to traffic Aug. 15, 1914, and since that time has proved an ever-increasing factor in the commerce of the world It is used by ships of practically all nations having merchant shipping and has served to reduce materially the time and cost of transportation from one continent to another. The canal was opened in 1914 notwithstanding the fact that in the latter part of 1913 there had been serious earth slides in Culebra Cut, and on Oct 13, 1914, navigation was seriously interfered with until the material could be dredged out These slides have occurred from time to time and cut off traffic from September, 1915, until Mar. 27, 1916; but since that time, with constant dredging and a careful study of local conditions, it has been possible to keep the canal open to traffic.

As the canal found increased use, docks, warehouses, and repair facilities were provided at either end, and the harbors were dredged to give access for the largest vessels using the canal. Fortifications protecting the canal and

its works were constructed, and every effort was made to secure its maintenance and operation on an economical and efficient basis. In fact, it was not many years before the canal more than paid all operating costs, and while this did not take into consideration the overhead and the interest on the original outlay, yet it prevented the canal from being a burden to the nation The cost of the Panama Canal up to the end of the fiscal year ending June 30, 1915, including the balance of appropriations still on hand and available for work in progress, was $357,436,048, from which should be deducted receipts from the sale of construction material and equipment and the value of buildings and plant turned over to the United States Army and the Alaska Railways Additional expense was of course involved for government sanitation, payment to the Panama government, etc , but the sum mentioned covered the actual cost of the project See UNITED STATES

The growing use of the Panama Canal is indicated by the accompanying table and particularly by the statement that during the calendar year 1923, 5037 commercial vessels passed through the canal, a greater number than in any previous year These vessels had an aggregate net tonnage, Panama Canal measurement, of 24,737,437, carried 25,160,545 tons of cargo, and paid $22,966,838.18 in tolls

Calendar year	No of ships	Panama Canal net tonnage	Tolls	Tons of cargo
1914 [a]	350	1 281 293	$1,508,737.56	1,758,625
1915 [b]	1,154	3 902 592	4,297 467 11	4,893,422
1916 [b]	1 217	3 817 704	3 671,162 68	4,774,822
1917	1 960	6 217,054	6,107,696 63	7,443,610
1918	2,070	6 409 886	6 317,455 39	7,284,159
1919	2,133	6 943 087	6,973,095 30	7,477 945
1920	2 814	10 378 265	10 295,362 21	11,236,119
1921	2 783	11 435,811	11 261 098 80	10,707 005
1922	2 997	12 997 573	12 573 407 77	13 710,556
1923	5 037	24 737 137	22,966 838 18	25 160,545
Total	22 515	88 118 702	85 972 321 63	94,446,808

[a] Canal opened to traffic Aug 15, 1914
[b] Canal closed about three months by slides

A total of 2714 vessels made the transit of the Canal from the Atlantic to the Pacific as compared with 2323 from the Pacific to the Atlantic. In tolls $11 534 023 was collected on vessels passing from the Atlantic to the Pacific as compared with $11,432,815 57 on vessels from the Pacific to the Atlantic.

An important development was the increasing use of the Panama Canal for the transportation of petroleum by tank vessels (see PETROLEUM), for the most part loaded on the coast of California. During the calendar year 1923, 1704 of the tank ships with a tonnage of 10,079,921 net tons passed through the Panama Canal, paying $8,967,647 41 tolls, and carrying 9,625,714 tons of cargo This was 33 8 per cent of the total number of transits during the year, 40 74 per cent of the total Panama net tonnage, 39 08 per cent of the tolls collected, and 38.25 per cent of the cargo carried through the Canal. Of these vessels 869 were laden and 835 were in ballast. Of the former, 804 made the transit from the Pacific to the Atlantic and 65 from the Atlantic to the Pacific, while 812 vessels in ballast went from the Atlantic to the Pacific and 23 from the Pacific to the Atlantic. In 1922 the Panama net tonnage of tank ships passing through the Canal was 1,557,931 tons, with a cargo of 1,423,695 tons, as compared with 10,079,921 Panama net tons and 9,625,714 tons of cargo in 1923, increases of 647 per cent and 676 per cent respectively. See COLOMBIA, *History*.

PANAMA CANAL TOLLS ACT. See UNITED STATES, *History*.

PAN-AMERICAN CONFERENCES. The Fourth Pan-American Conference, held in Buenos Aires July 1–Aug 30, 1910, closed its sessions without deciding on the seat of the Conference to be held during 1914. Later, in 1913, the direction of the Pan-American Union chose Santiago in Chile as the meeting place of the fifth Pan-American Conference, but due to the outbreak of the War in 1914 the Conference was postponed indefinitely Finally, in 1922, it was decided to hold the Conference in the City of Santiago during 1923 Meanwhile, in the interval between the Fourth and the Fifth Conferences numerous manifestations of Pan-Americanism occurred Thus the Second Pan-American Scientific Congress, which was in session at Washington during the three weeks following Dec. 25, 1915, appointed an International High Commission which met during 1916 The two Financial Conferences which met in Washington in 1915 and in 1920 dealt primarily with questions of public finance and with the monetary and banking situation in Pan-America and resulted in the creation in each country of a Financial High Commission, presided over by the respective minister of finance At the Conference of the Pan-American Federation of Labor in Laredo, Texas, in November, 1918, which was attended by delegates from the United States, Mexico, and Central America, a permanent federation was organized. Two Pan-American Child Welfare Congresses were held in Montevideo in December, 1918, and in May, 1919, at the second of which provisions were made for the establishment of an International Bureau of Child Welfare. The Second Pan-American Commercial Conference was in session in Washington during June, 1919.

The Fifth Pan-American Conference opened at Santiago on Mar. 26, 1923, and closed on May 11 after a session as to the results of which there is wide divergence of opinion. All American countries were represented, except Canada, which lacked "sovereignty," Mexico, which at the time was not "recognized" by the United States, and Peru and Bolivia, which refused to attend because of their differences with Chile The 18 subjects on the agenda were divided into the large groups disarmament, political coöperation, coöperation in commerce, hygiene, education, agriculture, etc. The most vital question by far was the disarmament problem, which concerned chiefly Argentina, Brazil, and Chile, since the United States was covered by the Washington Arms Pact and the other Latin American countries had only insignificant armament. If the chief object of the Conference was the fostering of closer relations between the states of the American continent, no such end was attained as far as the A B C States were concerned, inasmuch as the negotiations on disarmament resulted only in deepening the already existing discord between them. No satisfactory agreement was reached due to differences between Argentina and Brazil, each of which accused the other of aggressive aims and insisted on her own pacific intentions While the Conference thus ended in ill feeling between the A B C States, it was not necessarily the total failure which it has been regarded in many

circles, for the disarmament question was only one out of 18 subjects before the Conference.

Under the heading "political coöperation" the most important topic under discussion was the plan for the formation of an American League of Nations for which there seemed to be strong sentiment among the Latin American delegates. Two methods were projected to accomplish this, namely, the creation of a new association of the American states and the enlargement of the Pan-American Union which was the *ad interim* Executive Committee functioning in the interval between the Pan-American Conferences. The Latin Americans were able to wrest an important concession from the United States with respect to the composition of the governing board of the Pan-American Union. Hitherto this board had been composed of the diplomatic representatives of the American states in Washington and of the United States Secretary of State as permanent president Latin Americans considered this system highly disadvantageous to them since thereby membership was restricted to countries enjoying American approval and since the representatives, due to their diplomatic status in Washington, were prevented from commenting on important problems with the necessary freedom. Hence at Santiago the composition of the governing board was attacked by the Latin American delegates with rather un-Latin bluntness After three weeks of struggle a final compromise was effected whereby it was provided that the board should, as heretofore, be composed of the diplomatic representatives of the American states in Washington and of the United States Secretary of State, but that any country not having accredited representatives in Washington, or whose representative was temporarily absent, should be free to appoint a special representative on the board. At the same time the presidency was made elective and Costa Rica's proposal for the free appointment of any person as a country's representative on the governing board was referred to the governments for study In contrast to this partial success, Uruguay's proposal to bind the American nations closer together by the formation of a compact American League of Nations was shelved by the decision to hold over the plan and to recommend it for report to the next Pan-American Conference. During the debate on this subject some of the Latin American nations, led by Colombia, made some terse statements regarding the need of defining the Monroe Doctrine. Although the United States delegation tried consistently to ignore the topic it was finally compelled, under pressure from all the Latin American delegations, to state its position, which was that the Monroe Doctrine was a unilateral doctrine for which the United States had been and must continue to be solely responsible A forward step was the revival of the commission of jurists to codify American international law, to whose next meeting, set for 1925 in Rio de Janeiro, was referred among other important matters the proposal of Costa Rica for the creation of an American Court of Justice.

Noticeable progress was made in regard to the third group of subjects on the agenda, viz., cooperation in commerce, education, hygiene, agriculture, etc. An advance was made toward the solution of the problem of the adequate protection of trade marks, a question which had been before nearly every Pan-American Conference, by an agreement which protects fully the laws and conditions of every American country and provides a simple way for the registering of trade-marks in every American country. The Committee on Hygiene worked out a complete programme for public health in America and reported favorably on the question of the restriction of alcoholism on the American continent. The Committee on Education recommended the holding of a Pan-American Educational Conference in Santiago in 1925 to consider the exchange of professors and students and the standardization of university courses, credits, and degrees

PAN-AMERICAN UNION. See PAN-AMERICAN CONFERENCES.

PAN-GERMANISM. The term Pan-Germanism has a twofold meaning. In a loose sense it is a term popularly employed in many countries to stigmatize what was regarded as the German policy of imperialism and aggression before and during the War. This popular application of the term to German political and economic imperialism, or Germany's policy as a world power, was strictly an outgrowth of war-psychology, stimulated by effective propaganda, and was valid only to the very limited degree to which German world policy was affected by the aims and the doctrines of the Pan-German movement. It was only this latter movement, an expression of extreme German nationalism, which with justice could be called Pan-German. This movement, which had its inception in the '80's and '90's of the last century and the nucleus of which was the Pan-German League, a numerically weak but very aggressive and vocal group, aimed at the creation of a Greater Germany—to be composed of the German Empire, Austria-Hungary, Denmark, Holland, Belgium and Switzerland—and at the absolute hegemony of this superstate on the European continent At the same time the Pan-Germans strove for world expansion, naval supremacy and an extensive colonial empire. The fundamental thesis underlying these aims was the ethnical superiority and the cultural unity of the Teutonic peoples. In the German Empire the Pan-Germans were a relatively insignificant group and at the most only an extreme nationalist minority. In the eyes of the world outside, however, and especially to such people as were only too anxious to find manifestations of this sort in Germany, the Pan-Germans were proof of the widespread existence of aggressive designs, and their vociferous clamoring assumed an importance which was entirely disproportionate to their influence on the government or on public opinion. Although the government attempted with bad success to suppress the Pan-Germans as much as possible and the latter attacked the government's policy as sadly inadequate and detrimental to Germany's true interests, Germany's opponents before and during the War represented the Pan-German fulminations to be an expression of the real German policy. Thus there arose slowly the popular conception that German imperialism was a nation-wide and government-directed Pan-German scheme. The contrast between the Pan-Germans and the German government was attested by the attempts of the latter to suppress the Pan-German publications and pamphlets immediately after the outbreak of the War.

Throughout the War the Pan-Germans stood for the application of ruthless methods of warfare, notably for the unlimited employment of the submarine, and for the most far-reaching an-

nexations. While they worked in close harmony with certain military and naval circles, they exerted little influence over the German people and met with determined opposition from the civil government. It was only due to the interminable duration of the War, the ever-increasing sacrifices, and the insufferable economic hardships resulting from the blockade that the government and public opinion were finally induced to look with favor on unrestricted submarine warfare Whatever hold Pan-German ideas had obtained on the people during the War was swept away during 1918 and after the Armistice by the democratic wave which came over Germany. The Kapp Putsch in March, 1920, a Pan-German attempt to seize power, was foiled by the determination of the workers. If later there was a revival of Pan-Germanism, it must be ascribed to the Peace Treaty of Versailles and its dismal consequences for Germany. The complete national humiliation and degradation, political and economic, which Germany experienced after 1919 produced a recrudescence of extreme nationalism, the results of which were numerous parties and organizations with Pan-German tendencies Proof of the revival of Pan-Germanism as a result of the working of the Peace Treaty were the nationalist activities in Bavaria during 1923 and the results of the elections in May, 1924, when 32 representatives of the Volkische party were elected to the Reichstag. The Volkische or National Socialist party was, in 1924, the strongest and most vocal exponent of Pan-German ideas See WAR IN EUROPE.

PAN-ISLAMISM. Pan-Islamism is a movement which aims at the bringing together of the Moslems of the world regardless of nationality. As such it is both spiritual and practical It had existed in some form or other ever since Islam first made its appearance, but entered in modern times into a more active stage under the reign of the Turkish Sultan Abdul Hamid during the nineteenth century, when it was made to serve the ends of the Turkish state Despite their free-thinking religious tendencies, the young Turks, for political reasons, adopted in 1911 a definite scheme of Pan-Islamic propaganda and worked industriously in the direction of the union of the Moslems under the leadership of Turkey The Turkish-Italian War and the Balkan Wars gave new impetus to the movement, and the Ottoman Empire received in these struggles the sympathy of all the Moslems as well as active aid from many Mohammedan quarters outside of its confines At the same time, however, Pan-Islamism in its broader sense encountered many obstacles. The Young Turks themselves, by reason of the particular character of their doctrine, were more and more drifting into Pan-Turanian (q.v) channels. The spread of nationalism in various Moslem countries like Mesopotamia and Syria was detrimental to Turkish Pan-Islamism Other Mohammedan peoples, and particularly the Arabs, while quite willing to acknowledge the religious power of the Sultan, objected to his assumption of secular power over the non-Turkish Moslems. On the whole the doctrine of Pan Islamism, as set forth by the Turks, i.e. the concerted action of all the Moslems of the world under the leadership of the Sultan at Constantinople, was rather vague and suffered from many inconsistencies, as was conclusively proved by the events of the War. When Turkey entered the War on the side of the Central Powers, the Grand Mufti issued a call to all Moslems to defend, in the *Jihad* or "Holy War," the Islamic faith against the "Infidels." The call to arms was by no means generally effective, since it was realized by many Mohammedan leaders that Turkey had entered the war as ally of infidel powers. Moreover, the loyalty of the dependencies of Great Britain, France, Russia, and Italy, or perhaps the apathy of their inhabitants to the Turkish cause, proved in most cases stronger than the incitement to religious fanaticism. Even in the Ottoman Empire itself the support was by no means encouraging. The Arabs, who had long resented the heavy hand of their Turkish overlords, revolted and by their timely aid helped the English to eliminate Turkish rule in Arabia, Mesopotamia, Palestine, and Syria. The result of this revolt was the Arabic Kingdom of the Hedjaz and the loss to Turkey of the Holy Places in defense of which the *Jihad* was to be waged. The greatest success which the Turkish "Holy War" was able to register was the rising of the Senussites, a Mohammedan sect of great power in northeastern Africa and the eastern Sahara. The *Jihad* of the Senussites was conducted for several years against the British on the western border of Egypt and in the Sudan, and against the Italians in Tripoli, but failed finally, chiefly because of the failure of the adjoining Mohammedan peoples to support the movement. In the central and east Asiatic possessions of Great Britain and Russia, and in the French possessions in Africa, the "Holy War" aroused little enthusiasm, primarily because the inhabitants of these regions were too far removed from the scene of action to take great interest in the Turkish cause and to exert themselves for a Turkish Caliph of whom they perhaps had never heard Another reason for the failure of the "Holy War" was the fact that the old-time *Jihad,* based on religious fanaticism, was an antiquated method of warfare in the twentieth century. It is no doubt true, however, that the *Jihad* and the Turkish Pan-Islamic movement succeeded in stirring up unrest in the Asiatic and African possessions of the Allies, but at no time did the situation become serious Even Afghanistan, which was pro-Turkish and anti-British in sentiment, failed to take up arms against the Allies at that time.

With the breakup of the Ottoman Empire and the rise of the new Turkish Nationalist state in Anatolia, the main driving force behind Pan-Islamism as it had been understood before and during the War disappeared The Turks had always been strangers to the greater number of the Moslem population and the Turkish Nationalists devoted their attention now to their Turanian kinsmen, many of whom were non-Moslems. Thus the Pan-Turanian movement entered into a more vigorous stage. The Arabs, on the other hand, who during and after the War had come into their own and who for historical and other reasons should have been the natural protagonists of Pan-Islamism, had since the War gone in for Arab nationalism In addition, they were divided by old tribal differences and animosities and in Arabia itself bitter feud prevented any coöperation between the King of the Hedjaz and the Wahabites, the two all-powerful factions in the country. The most conscious expression of the Pan-Islamic idea was to be found in the post-war period among the Moslems of India, the leaders of whom set afoot an active

propagandist movement and preached by word of mouth and through writings the union of the Mohammedan peoples. In spite of its apparent inertia in the last years, however, Pan-Islamism was latent in the steadily growing unrest and revolt against the West, which, without any central direction for nationalistic or imperialistic ends, had been taking shape in the Asiatic world since the Armistice. This revolt of the East against the West contained all the essential elements of Pan-Islamism, but was in character quite different from the Turkish conception of this movement. It was a spiritual creed and embodied at the same time a complete social system. In this sense it was the natural counterpart of the Western nationalistic movement and a force with which the Western Powers had to reckon. That these powers had some realization of this fact was clearly manifested by the eagerness with which Great Britain and France attempted to capture the leadership of the Pan-Islamic movement upon the abolition of the Caliphate by the Turkish Nationalists. While the situation in the Moslem world was very hazy and undefined, one thing seemed certain, namely, that Western materialism had encountered serious Islamic opposition. "The theory of the spiritual and cultural unity of Islam," said the Aga Khan, "is the foundation of its life and soul" See, also, ARABIA, CALIPHATE, PAN-TURANIANISM, TURKEY.

PAN-SERBIANISM. See WAR IN EUROPE.

PAN-TURANIANISM. The term Pan-Turanianism is usually applied to the rather loose and vague movement which aims at the awakening of a sense of racial unity among all the various peoples of supposedly Turanian stock, and, through this means, the establishment of political cohesion among these peoples. Within this wider movement Pan-Turanianism is also used to describe in a more definite sense Turkish aspirations toward the creation of a large Turanian state to be constituted of certain closely related Turanian peoples and to operate under the hegemony of the Osmanli Turks in opposition to other races alien to the Turanian stock and particularly to the expansion of the Western Powers in Asia Pan-Turanianism therefore covers a broad racial and cultural movement which strives toward Turanian racial and linguistic unity and a more concrete political movement. Although the drawing of clear lines of demarcation would be dangerous, differentiation should be made between the wider cultural or truly Pan-Turanian movement and the more concrete Pan-Turkish or Pan-Turco-Tatar movement. In spite of its 10 or more years of existence, the former is still very undefined and represents at best a hazy ideal which faces insurmountable obstacles Pan-Turanianism is distinct from Pan-Islamism, both from the Turkish variety which existed before and during the War and from the post-war movement for the religious, cultural, and social unity of the Islamic peoples. A large percentage of the Turanians are non-Moslems, and for this reason the protagonists of Pan-Turanianism were forced to substitute for the powerful appeal to religious fanaticism the less potent appeal for racial and cultural cooperation Notwithstanding this distinction and certain anti-Moslem tendencies in the wider movement, Pan-Turanianism is capable of effective coöperation with Pan-Islamism. This applies particularly to the narrower or Turkish Pan-Turanian scheme which aims at the creation of a state wherein Islam would be the dominant religion, and which in its appeal to the Moslem Turanians made effective use of the religious motive. If carried to its logical conclusion, Pan-Turanianism would clash irreconcilably with Pan-Islamism. The great obstacles in the way of a realization of the wider Pan-Turanian aims become apparent on consideration of the ethnical groups which are regarded as component parts of the all-including Turanian political and cultural combination. The Turanian family is commonly divided into five groups: (1) the Finno-Ugrians in Scandinavia, Hungary, European Russia, and Siberia; (2) the Samoyeds in northern European Russia and in northern and central Siberia; (3) the Tungus in central and eastern Siberia and Manchuria; (4) the Mongols in Mongolia and the Caucasus; (5) the Turks or Turco-Tatars on the Balkan Peninsula and in Asia Minor, the Caucasus, northern Persia, the Volga region, Russian Central Asia, Russian and Chinese Turkestan, and southwestern, eastern, and northeastern Siberia. These peoples inhabit regions stretching from the North Cape, the Danube, and the Dardanelles to the Sea of Okhotsk and the desert of Gobi. They adhere to such widely different religions as Christianity, Islam, Buddhism, and Shamanism. Although their languages form one linguistic family, they show many and wide differences. Their cultural stages range from the high European culture of the Magyars and the Finns through many variations down to the primitive level of the Samoyeds, Tungus, and Yakuts. For these reasons alone, aside from political and economic considerations, the welding together of these cultural and territorially widely separated groups into one coherent movement seemed a rather fantastic enterprise.

The more practical aspect of the Pan-Turanian movement concerns itself solely with the political and cultural union of the various peoples belonging to the Turkish or Turco-Tatar branch of the Turanian family. Since the Turco-Tatars, with the exception of the Yakuts in Siberia, inhabit contiguous stretches of territory from Rumelia to the border of Mongolia, a Pan-Turanian movement in this limited sense presents a much more feasible programme than the wider movement. These peoples, moreover, are all adherents of Islam, and between them a close cultural and linguistic affinity exists. At the close of the War the Turco-Tatars numbered roughly 26,000,000, of which about 10,000,000 lived in the territory of the existing Turkish state. While union of all peoples of the five Turanian branches is only a fantastic theory, the movement for political, cultural, and religious cohesion between the Turco-Tatars was a practical policy, pregnant with great possibilities. This is chiefly the result of the unsettled conditions which exist in the Near East and Central Asia in consequence of the peace treaties and the Russian Revolution. Turkey, shorn almost completely of her alien subject races, emerged from the War as a compact Turco-Tata state Smaller in territory but stronger in vitality than the Ottoman Empire, nationalist Turkey abandoned the Caliphate and the old Turkish Pan-Islamic policy, evolved a race-consciousness based on the hardy Osmanli Turk peasant population of the Anatolian plateau, and adopted a Pan-Turanian policy. Instead of aiming at the subjection of the alien races to the Northwest and South, Turkey be-

gan to look eastward, to her Tatar and Turcoman kinsmen. Direct effects of the Russian Revolution, such as the establishment of the independent republic of Azerbaijan and the opening of Russian Central Asia to Turkish influence, brought this policy clearly within the realm of "Realpolitik." In the very obscure and hazy picture which Central Asia presented in the first five years after the War, strong Turkish influences could be discerned at work and there were many indications that a definite policy was being pursued with the view of creating a Turanian federation, to consist of Turkey, Azerbaijan, Turkestan, and Afghanistan. The actual conclusion of treaties by Turkey with Azerbaijan and Afghanistan in 1922 could be considered as a definite step in this direction. At the same time Enver Pasha, who had been branded a traitor by the Kemalists at Angora and who previously had been active in the Caucasus, pursued in Turkestan a Pan-Turanian policy of his own. In 1921 and 1922 he placed himself at the head of Turcoman bands and attempted to establish in this region a Turanian state in opposition to the Central Asiatic policy of Soviet Russia. His defeat by Soviet troops and his reported death in 1922 were a temporary setback to the Pan-Turanian movement. Notwithstanding apparent coöperation between Angora and Moscow in Central Asia, for purposes of present-day policy, Pan-Turanianism and communism are fundamentally at variance, and clashes between the two policies based on these doctrines are bound to appear in the future. There is more room for harmony between Pan-Turanianism and Pan-Islamism in Central Asia. On the whole the limited Pan-Turanian movement aiming at a union of the Turco-Tatar peoples contained a strong element of realism and had marked political, economic, and cultural possibilities, particularly in view of the unsettled conditions in the Near East and Central Asia. See TURKESTAN, RUSSIAN.

PAPER. See CHEMISTRY, ORGANIC.

PAPER AND WOOD PULP. The growth in the paper and wood pulp industries during the first 25 years of the twentieth century was extraordinary, and the increased production of printed matter of various kinds was remarkable in most of the civilized countries. The United States ranks first among the paper-producing countries of the world and is followed by Great Britain, Canada, and Germany, in the order mentioned, although other countries contribute wood pulp, which is the basis of the industry. The 1920 world production of paper was estimated at some 14,000 000 tons, of which the United States contributed more than half. In fact the paper and printing industries combined ranked sixth in the general census of United States manufactures taken in 1921. Among the four major groups when considered from the standpoint of product, they were worth $3,162,732,000, distributed as indicated in the accompanying table, which gives statistics for the census years 1919 and 1921 and, where comparable, for 1914

PAPER AND PRINTING INDUSTRIES

	Census year	Establishments	Wage earners	Wages	Cost of materials	Value added by manufacture	Value of product

Source Bureau of the Census, 1921 preliminary figures

At the base of paper manufacturing was the production of pulp, which in 1922 amounted to 3,464,258 tons, or slightly less than the record production of 1920, 3,807,656,000 tons. There are four major grades of pulp, and the proportionate production in the United States from 1914 to 1922 is indicated in the accompanying table.

PRODUCTION OF PULP IN THE UNITED STATES
(Tons of 20 00 pounds)

Grades	1911	1919	1920	1921	1922
Total	2,893,150	3,384,768	3,807,656	2,801,438	3,464,258

Other than wood pulp	...	9,903	7,821	7,069	11,470

Sources: Figures for 1914 from the report of the Bureau of the Census, Paper and Wood Pulp; 1919–22 figures from Federal Trade Commission Summary for 1922.

The United States does not produce all the wood pulp used in its paper industry, and considerable amounts of sulphite chemical wood pulp, both bleached and unbleached, and sulphate pulp, principally unbleached, are imported from Canada, Sweden, Norway, and Finland. The amount of sulphite imported in 1923 was

712,393 tons, valued at $48,791,077. This material entered the United States free of duty, and so did the sulphate wood pulp, of which, in unbleached form, 233,503 tons, imported in 1923, were valued at $15,204,012. The principal quantity came from Canada, which supplied 131,168 tons, as compared with 76,552 tons for Sweden. Of the sulphite in 1923, Canada furnished 299,183 tons, followed by Sweden with 201,023 tons, Finland with 70,665 tons, and Norway with 68,071 tons.

In 1921 the United States Census of Manufactures showed that out of 726 mills in the entire country, New York had 155 and was followed by Massachusetts and Wisconsin with 69 and 62 mills respectively. These three States indicated the geographical distribution of the industry, as the Middle Atlantic States were first in the number of mills, while New England and the Lake States were second and third respectively. At the beginning of 1923 there were 1691 paper-making machines with an estimated capacity of 9,560,000 tons per annum, and the normal running time of each machine was stated to be 270 days, about 75 per cent of the actual capacity. It will appear from the following table that the production of paper increased in the United States up to 1920, when the peak was attained with a total output of 7,334,614 short tons. There was a considerable falling off in 1921 due to the carrying over into that year of surplus stock from 1920, and in the years 1922 and 1923 the quantities produced were less, although in 1923 there was an increase in value. The table indicates the distribution of the production for 1914 and the years 1919-22 and also shows the development and production in the various lines.

NEWSPRINT PRODUCTION IN THE UNITED STATES AND CANADA

Sources: Figures for 1914 from the Bureau of the Census; figures for 1919–22, Federal Trade Commission Summary for 1922.

The United States also imported considerable paper, principally newsprint, which entered from Canada free of duty and in 1923 amounted to 2,617,685,620 pounds, valued at $98,021,045. Out of total imports of paper of $116,137,795, the foreign paper entering the United States did not compete seriously with the domestic product as American mills could not supply the great demand for newsprint. In regard to exports, however, American manufacturers do not compete actively on the basis of price but rather on that of quality. The total exports of paper except printed matter in the year 1923 aggregated $25,677,685 in value, of which newsprint accounted for $1,636,937; book paper, $3,001,149. Wrapping-paper, paper-board and straw-board, writing-paper, and photographic paper were among the other leading exports. The production of newsprint in the United States and Canada is indicated in the accompanying table, which shows the steady character of the industry in the United States as well as the marked increase in Canada. In the period under review there was an increase in prices which reached a maximum of about $.0608 in January, 1921, from which it declined to $.0375 in January, 1923. The increased demand for newsprint was due largely to the great extension of advertising, especially in the daily and Sunday papers, and it was estimated that $700,000,000 was expended for newspaper advertising alone in 1922.

The Canadian paper industry from 1914 to 1924 developed extraordinarily, not only for newsprint but also for book paper and writing-paper. The newsprint production, which in 1913 had been less than 400,000 tons, had increased to 875,696 by 1920, and after a temporary decline in 1921, reached a maximum of 1,166,225 tons in 1923, of which 1,043,139 tons were exported. The United States took 102,558 tons. For Conservation movement, see FORESTRY.

PAPINI, GIOVANNI (1881–). An Italian writer (see VOL. XVIII). He was the editor of *Lacerba* from 1913 to 1915 and *La Vrate Italie* in 1919. Converted to Catholicism in 1920, he published in the following year a *Life of Christ* which was translated into several languages and had a tremendous sale all over the world. In 1922 *Four and Twenty Minds* (*Ventiquattro Cervelli*) was published. It was a collection of essays written between 1902 and 1912. In his *Life of Christ* Papini made no attempt to apply any of the learned techniques of modern criticism. He contented himself like a true believer in rewriting the story of the Gospels in an artistic and imaginative fashion. In America the book was highly praised by many clergymen but was at the same time severely criticized by professional scholars. In 1924 Papini was invited to lecture at Columbia Uni-

versity on Italian life and literature, but did not accept. His autobiography, *The Failure*, was translated and published in New York in 1924. See ITALIAN LITERATURE.

PAPUA. See NEW GUINEA.

PAPYRI. See PHILOLOGY, CLASSICAL.

PAQUET, ALFONS (1881–). A German writer and traveler, born at Wiesbaden, and educated there and at the School of Commerce in London as well as the Universities of Heidelberg, Jena, and Munich. He traveled over the greater part of the world. Of his many works may be mentioned: *Auf Erden* (1906); *Held Namenlos* (1911); *Kamerad Fleming* (1911); *Li Oder im Neuen Osten* (1912); *Limo, der Grosse Bestandige Diener* (1913); *Erzahlungen an Bord* (1914); *In Palastina* (1915); *Nach Osten* (1915); *Im Kommunistischen Russland* (1919); *Der Geist der Russischen Revolution* (1919); and *Der Rhein als Schicksal* (1920).

PARAGUAY. A republic of South America with an estimated area of 196,000 square miles. The population was estimated at 800,000. The capital, Asuncion, had an estimated population of 99,836 in 1920. Other large towns are: Villarrica, 34,500; Concepcion, 25,000; Encarnacion, 16,000. Immigration increased little, in 1920 only 330 immigrants receiving state aid, and in 1921, only 576. In August, 1921, in the 27 National Colonies there was a population of 13,808 of whom 7755 were males. Education was still backward and in 1919 the total school registration was only 80,000 pupils.

Industry and Trade. Agriculture and grazing were the leading activities though more than half the total acreage was unexploited. The following products figured in Paraguay's foreign trade in 1922: extract of *quebracho* (used in tanning), 37,799,984 kilos; *quebracho* logs, 1,613,690 kilos; maté (Paraguayan tea), 5,186,587 kilos; oranges, 116,008,267 kilos; tobacco, 4,177,673 kilos. The cattle industry continued to increase up to 1920, there being 5,249,043 cattle in 1916. Other animals included: 600,000 sheep, 478,000 horses, 25,000 asses and mules, 61,000 pigs, and 87,000 goats. In 1922, 299,522 hides were exported and 1,553,572 kilos of jerked beef. Sugar and cotton were receiving greater attention. The sugar production in 1920 was 5230 tons; in 1921, 2579 tons; in 1922, 2400 tons. In 1922, 844,219 kilos of ginned and unginned cotton were exported. The 1922 production of cotton was 7000 metric tons. The country enjoyed great prosperity during the War because of the world demand for meats, but the depression of 1921–22 hit Paraguay particularly because of the low quality of its beef. The result was the absolute disappearance of any market for Paraguayan cattle. The fluctuations are reflected in the following figures (gold peso = $0.96): imports for 1914, 5,149,000 gold pesos; for 1919, 15,835,970; for 1921, 8,358,922; for 1923, 5,514,245; exports for 1914, 4,584,000 gold pesos; for 1919, 14,816,117; for 1921, 9,316,721; 1922, 9,599,007. The following were the proportions in value by countries of origin of Paraguay's imports: for 1913, Great Britain, 29 per cent; Germany, 28 per cent; Argentina, 13 per cent; United States, 6 per cent. For 1920, 1921, and first half of 1922: Great Britain, 19, 21, and 25 per cent; Germany, 3, 7, and 7 per cent; Argentina, 38, 39, and 36 per cent; United States, 24, 17, and 15 per cent. Many of the imports from Argentina were merely reshipped. The greater bulk of the exports went to Argentina for reshipment abroad.

Finance. The 1913 estimated revenue was 3,248,000 gold pesos and 21,688,000 paper pesos (paper peso worth 7 cents); estimated expenditure was 1,863,000 gold pesos and 48,307,000 paper pesos. The 1922–23 estimated expenditure was 1,011,058 gold pesos and 90,338,252 paper pesos (paper peso worth 3 cents); estimated revenue was 778,116 gold pesos and 99,805,100 paper pesos. On Dec. 31, 1922, the outstanding external debt was $5,842,692 and the internal debt (including outstanding paper money), $7,439,180. In 1914, the figures were external debt, $3,757,573; internal debt, $5,091,218.

History. Sr. Eduardo Schaerer (1911–15) was the first president in 40 years to complete his term He was succeeded by Sr. Manuel Franco (1916–19) under whose peaceful administration the country made advances in the development of the packing industry, the products of which, by 1919, became Paraguay's leading export. Sr Manuel Gondra was elected for 1920–24, but he resigned in 1921, and was succeeded by Dr. Eusebio Ayala. These changes were due to threatened revolts. In 1921, it was announced that Paraguay would not meet her external obligations, with the result that an American financial adviser was called in to render assistance. In 1923, Dr. Eligio Ayala was elected provisional president.

PARALYSIS, INFANTILE. See INFANTILE PARALYSIS

PARASITOLOGY. See VETERINARY MEDICINE.

PARAVANE. A naval device developed by Commander C D Burney of the British Navy. Its earlier form, the explosive paravane, was designed mainly for use against submerged submarines and had many resemblances to the old Harvey towing torpedo. It consisted of two cigar-shaped submerged mines, each carrying an explosive charge and a depth mechanism to insure its sustained immersion at the desired depth. The mines were towed by cables, one on each side of the ship, and were deflected outward by fixed vanes on the shell until the towing cables made an angle of 20° to 60° with the ship's course, depending on the speed. The explosion of the charge took place if the hull of a submarine or the shell of a mine were struck or if a firing key on the bridge were pressed. In the later type, the torpedo-shaped floats, or "otters" as they were called, carried no explosive charge but were fitted with saw-like jaws for cutting mine-anchor cables. The towing rope was attached to the stem of the ship a dozen feet or more below water. Any mine which did not squarely strike the stem of the ship was caught by one of the towing ropes pressing against the anchor line. The latter slid along the towing rope until it reached the "otter's" jaws, where it was instantly cut. The mine then rose to the surface clear of the ship and could be easily destroyed by gunfire. This type of paravane was eventually fitted to all large warships and merchant steamers. Paravanes saved many vessels from being sunk by mines and revealed the location of several new and unknown mine fields. They were also used for mine-sweeping and in searching for mine fields. See MINE, SUBMARINE.

PARIS. See WAR IN EUROPE, *Western Front*.

PARIS CONFERENCE. See PEACE CONFERENCE AND TREATIES.

PARK, JULIAN (1887–). An American educator, born at Buffalo, N. Y., and educated at Williams College and the Paris, Columbia, and Minnesota Universities. He was assistant director of the Buffalo Fine Arts Academy from 1911 to 1913 and in the latter year was appointed instructor in French at the University of Buffalo He was successively instructor in history, professor of history, and department head, secretary of the College of Arts and Science, and dean. The last office he held after 1918. He was a member of many historical and learned societies and was the author of *Philatelic Rambles* (1912); *History of the University of Buffalo* (1917); *Subject Peoples under the Teutons* (1918); and *Cuba in the Seven Years' War* (1920). He was a frequent contributor to *The University of Buffalo Studies.*

PARK, WILLIAM HALLOCK (1863–). An American bacteriologist, pathologist, and sanitarian, born in New York City, and educated in the College of the City of New York and Columbia University. In 1897 he was made professor of bacteriology and hygiene in the Bellevue-University Medical College, and after the death of Egbert Lefevre, dean of the faculty there. In 1894 he had been appointed director of the bureau of laboratories of the New York Board of Health. In 1900 appeared his textbook, *Bacteriology in Medicine and Surgery,* while in 1910, in collaboration with Williams, he published *Pathogenic Microörganisms,* which passed through 7 editions in 10 years. He edited the reference work *Public Health and Hygiene* (1920) and was a voluminous contributor, alone or in collaboration, to the periodical press, with special reference to diphtheria and typhoid fever

PARK COLLEGE. A nonsectarian institution at Parkville. Mo., founded in 1875. The size of the college remained approximately the same during the decade between 1914 and 1923–24, with an enrollment of 412 students, a faculty of 24, and a library of 25,000 volumes in the former year, compared with an enrollment of 443 students, of whom 94 were in the preparatory school, a faculty of 28, and a library of 30,000 volumes in the latter. Several buildings were put up, including the president's residence, a men's dormitory, a lighting and heating plant, and a Carnegie Library, as well as a science building which was in course of construction in 1924. The endowment fund was about doubled President, Frederick William Hawley, D.D., LL.D.

PARKER, SIR GILBERT (1862–). An English novelist (see VOL. XVIII). From 1900 to 1918 he was a member of Parliament from Gravesend. He was created a baronet in 1915. During the first two years of the War he had general charge of British publicity in the United States and in this capacity did excellent service in creating favorable sentiment in behalf of the Allies. His later books include: *You Never Know Your Luck* (1915); *The World For Sale* (1916); *Wild Youth* (1919); *No Defense* (1920). He also wrote, in 1915, *The World in the Crucible,* a book on the War.

PARKS, NATIONAL. Congress created in August, 1916, the National Park Service, which placed the national parks and monuments in the Department of the Interior, under the general charge of a director. The act provided also that the Secretary might make rules and regulations for the use and management of the reservations and prescribe punishment for the infraction of such rules and regulations. Up to 1916, 16 parks had been created; the latest up to that time were the Hawaiian National Park in the Territory of Hawaii and the Lassen Volcanic National Park in Northern California. A bill was introduced into Congress in 1916 for the establishment of Mt. McKinley National Park in the Territory of Alaska. A tract of land in 1916 was given by citizens of Maine to the Government of the United States. It has an area of 10,000 acres, on Mt. Desert Island. It was given by President Wilson, the name of Sieur de Montes National Monument, but in 1919 Congress renamed it Lafayette National Park. The number of visitors to the national parks steadily increased during the decade. In 1918 there were 451,691 visitors; in 1920, 1,058,455. In view of the increasing interest and importance of the national park system, the attempts of private irrigation and water power system interests to obtain control gave serious concern to the authorities during the decade Among the various projects considered likely to injure the parks was that for a dam at the outlet of Yellowstone Park. The formal dedication of the Grand Canyon of Colorado as a national park took place on Apr. 20, 1920. In the year 1921 visitors to the national parks numbered considerably over 900,000, while the visitors to the national monuments numbered 164,461 The first national conference on State parks was held in 1920 at Des Moines, Iowa The purpose of the movement is to preserve places in the various States and to maintain them under State control as centres of health, recreation, and education. As a result of the conference, several States which heretofore had no State parks undertook the first steps to secure them. The Hawaiian National Park was formally dedicated on July 9, 1921. This is on the rim of the crater of Halemaumau. The park contains two active volcanoes, Kilauea and Mukuaweoweo. Bills were introduced in Congress during this year for national parks in Utah: the Mammoth Cave in Kentucky; Mt. Katahdin, Me.; Mt. Baker, Wash.; Mt Battell, Vt.; Kill Deer Mountain, N. D.; and Roosevelt National Park, N. D There were also several proposals for national monuments in Colorado, Washington, Nevada, and other States. The visitors to the parks in 1922 numbered 1,216,490. This year marked the fiftieth anniversary of the establishment of Yellowstone Park, the first of its kind in the world. During this year, legislation was passed adding to the area of Mt. McKinley Park in Alaska and to that of Hawaii National Park. Bills were also introduced for the establishment of other parks in Washington, Arkansas, South Dakota, Virginia, and Georgia. A movement was undertaken to increase the area of the Sequoia National Park in California and to change its name to the Roosevelt-Sequoia. No action was taken by Congress. The number of visitors in 1923 (1,280,886) again exceeded that of the previous year; while visitors to the national monuments numbered 212,826. The movement to save the great redwoods of California which was carried on throughout the decade received fresh impetus during 1923 by the action of the California Legislature, which passed, in May, a law calling for a survey of all timber lands available for park purposes by the State Forestry Board. Congress in 1923 empowered the Secretary of the Interior to obtain complete

title to any or all of the private holdings within Glacier National Park, by exchanging them for other public lands of equal value in Montana. Bills were introduced for the Appalachian National Park in Virginia and the Lincoln National Park in Kentucky, Tennessee, and Virginia. By presidential proclamation, new national monuments were established at Fossil Cycad in South Dakota; Aztec Ruin in New Mexico; Hovenweep in Utah and Colorado; and Pipe Spring in Arizona. In addition, the Bryce Canyon National Monument and the Timpanogos Cave in Utah were established under the Department of Agriculture, and the Mt. City Group National Monument in Ohio under the War Department.

PARMOOR, CHARLES ALFRED CRIPPS, first BARON (1852–). An English lawyer, educated at Oxford. He was one of the most prominent laymen of the Church of England. Elected to Parliament in 1895, he was a Conservative in politics but later broke away from his party because of his free trade ideas. He supported Labor, became a strong believer in the League of Nations, and was appointed by Prime Minister Ramsay Macdonald as Lord President of the Council in his cabinet, where he was responsible for matters arising out of Great Britain's membership in the League of Nations. He published *Principles of Compensation* and *Laws of Church and Clergy.*

PARODI, DOMINIQUE (1870–). A French philosophical writer, disciple of Renouvier and Hamelin. He published in 1919 a comprehensive survey of contemporary French philosophy (*La Philosophie Contemporaine en France, Essai de Classification des Doctrines*). His other works include *Le Problème Moral et la Pensée Contemporaine* (1910) and *Traditionalisme et Démocratie* (1909).

PARSONS, FRANK ALVAH (1868–). An artist and critic born at Chesterfield, Mass., who studied art in Italy, France, England, and Austria. He has published many books on art, including *Principles of Advertising Arrangement; Interior Decoration, Its Principles and Practice; The Psychology of Dress; The Art Appeal in Advertising Display.* He was co-author of *Advertising, Its Principles and Practice,* and *Art, Its Principles and Practice Applied to Modern Life.* Besides writing books on art he has delivered lectures in many parts of the United States and written articles and pamphlets on art subjects. He was president and director of the New York School of Fine and Applied Art, after 1905, and one of the most influential art educators in the United States.

PASHITCH, NIKOLA (1845–1926). A Jugo-Slav statesman. For over 50 years he was one of the leading political figures in the Balkan states and was Prime Minister of Serbia more than 12 times. He was twice imprisoned for refusing to lend himself to the former Obrenovitch dynasty in behalf of Austria-Hungary. He was one of the most prominent figures at the Peace Conference in Paris, where largely through his efforts the kingdom of Jugo-Slavia was established. In 1923 an unsuccessful attempt was made on his life. His negotiations with Italy settled in 1923 the long-disputed Fiume question See JUGO-SLAVIA.

PASSY, PAUL EDOUARD (1859–). A French philologist who has made a special study of phonetics (see VOL. XVIII). His later publications include: *Phonetic Reader* (1915); *Premier livre de Lecture* (1917); *Lectures Françaises Phonétiques* (1918), and *Conversations Françaises en Transcription Phonétique* (1919).

PASTOR, LUDWIG (1854–). A German historian (see VOL. XVIII). He lives in Innsbruck and in Rome. His publications during the decade 1914–24 were: *Conrad von Hötzendorf* (1916); *Generaloberst von Danke* (1916); and *Der Staat Rom zu Ende der Renaissance* (1916). He edited *Johannes Janssens Briefe* (1922).

PATERSON. A manufacturing city of New Jersey. The population increased from 125,600 in 1910 to 135,875 in 1920, and to 139,579, by estimate of the Bureau of the Census, for 1923. A comprehensive zoning ordinance was adopted in 1921, providing for four residence and two business districts and a light and a heavy industrial district. Four modern school buildings were completed, 1914–1924, and in the latter year a $1,250,000 high school was in process of construction The number of manufacturing plants increased from 702 in 1909 to 1200 in 1923, and the value of their output from $67,000,000 to $225,000,000. Paterson is the leading silk manufacturing centre in the United States, About 30,000 persons were engaged in the silk manufacturing industry alone in 1924. Bank resources rose from $43,000,000 in 1914 to $110,952,976 in 1924

PATTERSON, JOHN THOMAS (1878–). An American zoölogist, born at Piqua, Ohio, and educated at Wooster University and the University of Chicago. He was professor of biology at Buena Vista College (1903–05); assistant in zoölogy at the University of Chicago (1905–08); and instructor (1908–11), adjunct professor (1911–13), and professor (1913–) at the University of Texas. He published articles in zoölogical journals on the embryology of the armadillo and on polyembryony in insects.

PAUL TEST. See SMALLPOX.

PAVEMENTS. See ROADS AND PAVEMENTS.

PAYNE, GEORGE HENRY (1876–). An American writer, born in New York City, and educated at the College of the City of New York, the College of Pharmacy, and the New York Law School. He was for many years engaged in newspaper work in New York City and took an active part in politics as manager of campaigns for several candidates. In 1917 he was appointed New York City's representative on the State Council of Defense and organized the Committee of American Business Men in 1919. His books include *History of the Child in Human Progress* (1915) and *History of Journalism in America* (1919). In 1920 he purchased *The Forum.*

PAYNE, JOHN BARTON (1855–). An American public official, born at Pruntytown, Va., and educated at Orleans, Va. He began to practice law in West Virginia in 1877. He was active in politics and in 1882 was elected mayor of Kingwood, W. Va. He moved to Chicago in 1883. He was appointed judge of the Superior Court of Cook County, Ill., holding the office for five years. He was appointed general counsel of the United States Shipping Board Emergency Fleet Corporation in 1917 and to the director general of railroads in 1918. He held the post of Secretary of the Interior in President Wilson's cabinet from February, 1920, to Mar. 4, 1921. He was made chairman of the American Red Cross by President Harding on Oct. 1,

1921. In April, 1923, he was one of two commissioners appointed by President Harding to confer with representatives of Mexico with a view to American recognition of Mexico. The negotiations were opened in May, and after weeks of discussion in regard to damage claims, boundary disputes, and the holding of oil and agricultural lands by foreigners, matters were arranged, and recognition consummated by Aug. 31, 1923.

PEABODY MUSEUM OF HARVARD UNIVERSITY. The museum continued active work during the decade 1914–24. Expeditions were sent out in 1915 to the Canary Islands, the Libyan Desert, and Arizona. Researches were continued also in Central America and the Delaware Valley and other parts of the United States. During 1916 the museum was engaged in preparing for publication the first number of the *Harvard African Studies*, six volumes of which were published up to 1924. Much valuable material was received from the Koren Arctic Expedition to northern Siberia. In 1917 the Central American Expedition continued its work and made discoveries of large groups of ruins in Honduras and Guatemala. Field work was carried on in the cliff-house region of northeastern Arizona. The seventh volume of the museum papers dealing with the history of the Spanish conquest of Yucatan was issued. Two of the five large exhibition halls in the new section of the museum were opened to the public. After the entry of the United States into the War, the active work of the museum was largely suspended, but in 1918 an expedition was sent to the Vancouver Islands to study Indian remains there. Explorations were also carried on in various parts of the United States. The normal activities were gradually reëstablished during 1919, but little field work was carried on. Several valuable collections were received, including the Bates Collection from the shell heaps of Maine. The museum issued several important publications during this year The field work in 1920 was confined chiefly to Arizona and Africa. Much important material relating to the cliff dwellers was collected In 1921 extensive field work was conducted in various fields An expedition to Central America visited ruins in northern Yucatan and continued investigations into northern Guatemala Explorations into Arizona were continued, and researches were carried on in France and Belgium. Considerable additions were made to the collections of the museum by purchases and gifts in 1922, and important rearrangements and exhibits were made. Field work in Central America was prosecuted during the year, and the expedition to Arizona continued its investigations. In 1923 the Central American expedition spent three months in Yucatan, Honduras, and Guatemala. One of the results of this work was the discovery of an ancient culture previously unknown to scientists. Valuable collections were received from the New Hebrides group, and the museum received the Theodore N. Vail collection of stone implements.

PEACE CONFERENCE AND TREATIES. A task of world-wide reconstruction and readjustment confronted the statesmen and diplomatists of the victorious Allied and Associated Powers at the end of the Great War. To arrange a settlement of the problems of peace a whole series of conferences has been held from 1919 to 1924 and the results of their deliberations have been registered in numerous agreements, treaties, protocols, and conventions, or have silently woven themselves into the very warp and woof of human society. During the War the Allied cause in general had represented "a most curious combination of lofty idealism with an undercurrent of selfish ambition." The openly avowed ideals were usually at utter variance with the more sordid ulterior aims. "Practical" men—nationalists, imperialists and militarists—insisted that the immediate problem was to punish Germany and her allies for their atrocious crimes against civilization, to exact the greatest possible indemnity, to reduce the Central Empires to military impotence and so to cripple German industry and commerce as to make impossible any effective or dangerous competition by her in the future economic development of the world. The German colonies and the Turkish Empire were to be divided up among the victors and the litigious estates of the Habsburgs liquidated to satisfy the nationalistic aspirations of Italy and the smaller Allies. Most of these aims had been embodied in the secret engagements and commitments negotiated by the various European Allies and Japan at intervals during the years 1915, 1916, and 1917, before the United States entered the War. In regard to Turkey secret discussions continued unabated throughout the conflict and at the time of the Peace Conference in 1919 Lloyd George and Clemenceau were still haggling silently but strenuously over the division of the spoils These secret treaties constituted a comprehensive programme for dividing up the world, a hard and fast basis for the final peace settlement. They "were destined to bear a crop of suspicion, controversy, balked ambition, which twice at least, nearly wrecked the Peace Conference, poisoned its discussions, and warped and disfigured its final decisions."

Entirely opposed to the plans of settlement represented in the secret treaties were the openly voiced aspirations of numerous liberal and labor groups in the various belligerent countries. Some of the statesmen who professed idealistic motives were sincere in their convictions; others utilized idealism as a cloak for their activities while engaged in forging the chain of secret treaties. Yet their utterances outwardly imparted to the Allied cause during the last few years of the War all the moral elevation of a crusade for human righteousness. In particular the various addresses of Woodrow Wilson, President of the United States, served to clarify the fundamental issues of the War and to provide a set of legitimate aims and guiding principles for the inauguration of a more enlightened era of international peace and coöperation. From 1917 on Mr. Wilson enjoyed an unparalleled prestige and influence in the public opinion and counsel of the world. The principles of his war-aims addresses of 1918 were the official basis of the pre-armistice terms agreed upon with Germany and her associates. These terms were binding on all parties and constituted in a technical sense the legal basis of the peace settlement. With two qualifications the Allied Powers bound themselves to impose no conditions of peace inconsistent with Mr. Wilson's "Fourteen Points" of January 8, his "Four Principles" of February 11, his "Four Ends" of July 4, and his "Five Particulars" of September 27. Judgment was reserved by the Supreme War Council on the second of the Fourteen Points relating to the

"freedom of the seas"; this was declared to be open to various interpretations some of which they were unable to accept. In addition it was expressly stipulated that the demands for the restoration of territories invaded by Germany should include compensation for all damages done to the civilian populations of the Allied countries by land, by sea and from the air The Armistice signed with Austria and Hungary was unconditional as finally agreed upon, yet the preceding diplomatic exchanges between the Austro-Hungarian and American governments had created, if not a legal, at least a strong moral obligation to arrange peace upon the basis of the President's addresses except in regard to Point Ten, which was modified by Wilson himself to assure complete and unconditional self-determination to the Czecho-Slovaks and Jugo-Slavs hitherto incorporated in the Dual Monarchy. With Bulgaria and with Turkey Mr. Wilson entered into no negotiations at all, but the Fourteen Points touched upon their cases

The two months which elapsed between the signing of the Armistice with Germany (Nov. 11, 1918) and the first meeting of the major Allied plenipotentiaries in Paris (Jan 12, 1919) were marked by extremely significant developments throughout the world The contemporaneous revolutions in Central Europe which resulted in the establishment of democratic republics in Germany, Austria, and Hungary failed to effect any considerable change in the attitude or plans of the Allies. In Italy a tremendous wave of nationalistic feeling overwhelmed all efforts of liberal and socialist leaders to pledge the support of that country to a peace of conciliation. A ministerial crisis was precipitated in late December and early January, but with the resignation of socialists and moderates, the imperialist group headed by Premier Orlando and Foreign Minister Sonnino strengthened its grip upon the government In France Premier Clemenceau, unmoved by socialist attacks, announced his intention of securing the utmost possible security and indemnification for France together with the maintenance of the old system of alliances His government received an overwhelming vote of confidence as he thus threw down the gage. In Great Britain, Parliament was dissolved in November and a general election held on December 14. Premier Lloyd George, discarding the liberalism of his war-aims speech of Jan 5, 1918, made the issue of his campaign a hard and bitter peace. His platform included recovery of the entire costs of the War—"shilling for shilling and ton for ton" —and punishment of war criminals. The result was a stupendous triumph for his Coalition which secured a majority of over 260 seats. The Labor party advocating a Wilsonian peace secured 61 seats and became the Official Opposition

President Wilson could point to no such popular mandate or parliamentary vote of confidence Indeed, despite his appeal to the American people for support in the shape of a Democratic Congress, the elections of November 5 had returned small Republican majorities in both the House and the Senate. Republican leaders in office and out were bitterly attacking the President's policies Ex-President Roosevelt was particularly vehement. He openly asserted that Mr Wilson had no authority whatsoever to speak for the American people as his leadership had just been emphatically repudiated by them. It was the duty of the Allies to impose their common will upon the nations responsible for the hideous disaster which had almost wrecked mankind. Mr. Roosevelt's manifesto harmonized perfectly with the purposes and plans of Clemenceau and Sonnino. Notwithstanding the fact that recent electoral reverses had thus seriously discredited his leadership at home, Mr. Wilson, against the advice of Secretary of State Lansing, made the momentous decision to go abroad as head of the American commission to negotiate peace. He was animated by a sincere determination to work for the incorporation of his ideals into the substance of the peace treaty, to see to it that no false or mistaken interpretation was put upon them and no possible effort omitted to realize them. He claimed to be under no illusions as to the difficulty of realizing his programme. Arriving in France on December 13, Wilson found that although the date for the Peace Conference had been set for the 17th a month more was to elapse before real work began. He spent the interval visiting the various Allied countries, conferring with statesmen and making speeches, being warmly received by liberal and radical elements which gave whole-hearted support to his reiterated proposals for a peace of justice.

THE PARIS PEACE CONFERENCE

The five Principal Allied and Associated Powers which had contributed most to the winning of the War assumed supreme charge of arranging the Peace. It was early decided to exclude the enemy powers from the impending Congress until preliminary terms had been agreed upon among the Allies. Paris—the shell-shocked nerve-centre of Allied resistance to Germany—was selected as the scene of the Preliminary Conference. Here on Jan. 12, 1919, there finally convened a meeting of the Supreme Council, its membership now comprising the chief executives of Great Britain, France, Italy, and the United States, together with their respective foreign ministers. Two Japanese representatives were admitted on the following day and this "Council of Ten," as it came to be known, definitely inaugurated the work of the Peace Conference and continued to dominate the course of events until the middle of March when it was transformed into the "Council of Four" and a subordinate "Council of Five."

Organization. Quickly the Council of Ten proceeded to the organization of Peace Conference machinery Thirty-two states which had been at war with Germany or had severed diplomatic relations with her were admitted to membership in the plenary Conference, though with varying degrees of representation. Adopting a middle course between the proposals of the extreme militarists who advocated a body made up of delegates from the Great Powers alone which should frame a treaty to be imposed on smaller Allied States and enemy powers alike, and the proposals of the extreme legalists who championed the theoretical equality of nations with uniform representation for all, the Supreme Council apportioned plenipotentiaries to each on the basis of size, military power and prestige and service or suffering in the recent War. Of the 70 officially authorized plenipotentiaries five were assigned to each of the Great Powers—France, Italy, Japan, Great Britain and the United States; three each to Belgium, Brazil, and

Serbia (later officially recognized as Jugo-Slavia); two each to Australia, Canada, China, Czecho-Slovakia, Greece, Hedjaz, India, Poland, Portugal, Rumania, and Siam; and one apiece to Bolivia, Cuba, Ecuador, Guatemala, Haiti, Honduras, Liberia, New Zealand, Nicaragua, Panama, Peru, and Uruguay. While thus allocating the formal representation for plenary sessions, the Council of Ten reserved to itself the power of determining the course of procedure, conducting preliminary deliberations and making the really important decisions. The plenary sessions were to prove almost entirely devoid of any significance save the ceremonial function of ratifying and registering decisions already made. On January 18, at the first plenary session, Premier Clemenceau of France, who presided at meetings of the Supreme Council, was elected as President of the Conference.

In addition to formally authorized participants in the Conference, streams of uninvited and sometimes unwelcome guests from all parts of the world converged upon Paris, in the hope of securing a hearing or at any rate of arousing interest in the aims and ambitions of their respective nationalities. Armenians, Syrians, Georgians, Ruthenians, Esthonians, Lithuanians, Letts, Finns, Albanians, Persians, Egyptians, Koreans, Zionists, Schleswigers, Aland Islanders, Irish-Americans, Negroes, and others came to present ex-parte evidence and plead for justice. "Never before had Europe witnessed such a gathering of rulers and rivals, of realists bent on material gains and idealists striving for a happier world." Realists and idealists alike usually met with disappointment. Small nations were to be allowed to present their cases; even neutrals were to be heard in matters specifically affecting their interests; but the real power was to rest with the chief representatives of the five largest states.

To assume, however, that the treaties emanating from Paris were drafted by a small group of men—the "Ten," the "Four," or the "Three"—and that the terms were fixed by them would be highly erroneous. Each delegation at the Conference had a numerous staff of territorial, ethnographic, and historical specialists, economic advisers and other experts, and these together with the plenipotentiaries supplied the personnel for some 58 technical commissions constituted during the first six months of 1919 to make preliminary investigations and reports on various problems of the settlement. These commissions held over 1600 meetings and their conclusions and recommendations were discussed by the Council of Ten, which held 72 meetings, the later Council of Four, which held 145 sessions, and the subordinate Council of Five, which met 39 times. Most of the articles in the treaty were taken bodily, without change, from the reports of commissions.

Wilson's First Point declaring for "open covenants openly arrived at" was seriously vitiated at Paris. Despite a keen struggle waged by the Americans for a wider measure of publicity, only the plenary sessions of the Conference were opened to the press. Lloyd George, Clemenceau, and Orlando uniting to demand that the executive councils deliberate in secret, it was decided and announced that publicity with regard to their proceedings "must be subject to the limitations necessarily imposed by the difficult and delicate nature of their object." The army of newspaper correspondents was obliged to be content with brief and non-committal communiqués issued each day, the scanty substance of which had to be supplemented with the gleanings of gossip, semi-official conferences with directors of publicity appointed by each delegation, and occasional interviews with important plenipotentiaries. But in devious ways and for ulterior purposes reports of secret proceedings frequently reached the printed page, garbled, perhaps, to advance the interests of those who instigated publication.

"The Big Four." In addition to running the conference machinery and determining final terms of peace, the members of the Supreme Council were burdened with complicated and urgent tasks of administration. Each leader had to consider public opinion and political developments at home, problems of demobilization and economic readjustment. The armistice terms with Germany had to be renewed, measures taken to combat the spread of Bolshevism, and to feed, clothe, and house refugees in a dozen regions of Europe. Eastern Europe was in chaos, Central Europe was in revolution, and Western Europe trembled on the verge of exhaustion and collapse Everywhere the various nationalist groups were attempting to anticipate the decisions of the Conference by seizing as wide an area of debatable territory as possible. At one time American observers counted as many as 14 small wars raging in various parts of Europe. The maintenance of political stability and the restoration of economic processes to more normal functioning had to be accomplished in the face of nationalistic quarrels and social unrest that threatened to plunge all Europe into renewed anarchy and to spread the tenets and tentacles of communism westward to the Rhine and the Adriatic.

The position of Woodrow Wilson and his American colleagues was at once highly advantageous and supremely difficult. Mr Wilson enjoyed great prestige as the head of a wealthy, powerful, and influential nation. The moving eloquence of his lofty declarations on the issues of the Great War and the principles of a lasting settlement together with his vigorous advocacy of a league of free nations coöperating in the fruitful processes of peace had earned him a numerous following among liberal and labor elements the world over. His programme for world settlement had been officially endorsed as the basis of peace at the time of the armistice negotiations, and he came to Paris determined to secure the application of the twin principles of national self-determination and international coöperation.

But speaking broadly one may say that the representatives of the other Allied Powers did not view with entire favor the policies of Mr. Wilson. They might with diplomatic tact, with reassuring cordiality, agree with Mr. Wilson "in principle," yet their manifest purpose was to negative his projects in detail. Throughout the long negotiations during the first six months of 1919 with the endless proposals and counter-proposals, discussions, and decisions, the central ideas of the leaders of the different delegations, except possibly the British, remained fairly consistent. Premier Clemenceau of France, in addressing the assembled plenipotentiaries on January 18, announced that the principles of the peace had been laid down by President Wilson and adjured all to work quickly and well. Yet there was not in Paris a more persistent or dogged opponent of Mr. Wilson's

ideals and policies than Clemenceau A statesman and politician of the realist school, steeled by half a century's experience in French politics, he was cynical of the idealism which had been so widely extolled. Being utterly convinced that the Germans understood nothing but force, he made no pretense of being bound by the Fourteen Points. His one interest was his beloved France and his one dominating purpose the demolition of Germany and the achievement of security for France. "The French position at Paris was set forth and defended with matchless ingenuity and obstinacy. . . . Foch had a military plan of safety, Bourgeois a diplomatic plan, Loucheur and Klotz an economic plan, but the coördination between them was perfect and Clemenceau was the supreme strategist of the entire campaign"

David Lloyd George, the leader of the British delegation, was perhaps the most unstable character at the Conference. No plenipotentiary ever approached the task of readjusting a shattered international order with a more slender equipment of detailed knowledge and though he possessed the capacity of acquiring effective information at lightning speed, he seemed to have no guiding principles Leaping nimbly from extreme to extreme—a human barometer charged with Celtic quicksilver—he seemed to live in constant apprehension of parliamentary repercussions Guided by the dictates of expediency alone, Lloyd George sought always to advance the interests of the British Empire, to prevent the French from getting too much, to render Germany incapable of offense by land or sea, to make her pay for the War up to the measure of her ability, and to surrender her war criminals, yet not to impose terms of such severity that the German government would refuse to sign. The surrender of the German fleet had already secured Great Britain in the supremacy of the seas and this the British determined to maintain. They had specifically reserved approval of Mr Wilson's Second Point relating to the "freedom of the seas" and it was a distinct concession to their susceptibilities that so little discussion of this subject took place at Paris. Outside of that the main interest of the British was in the disposition of the former German colonies and the dismemberment of the Turkish Empire Here their claims clashed both with rival French and Italian interests and with Mr. Wilson's principles. Subject to these modifications and exceptions the British tended to favor a League of Nations

Equally distrustful of the Wilsonian programme of peace and equally importunate in their demands for territorial cessions were the Italians represented in Paris by Premier Orlando and his foreign minister, Sidney Sonnino Though less powerful than their colleagues, these Italian delegates, supported by a strong nationalist and imperialist sentiment at home, determined to complete Italian national unification, obtain strategic security and imperial aggrandizement on the north and in the Adriatic, and share more largely, even though at French and British expense, in the political control and economic exploitation of Africa and Asia Minor.

The Japanese plenipotentiaries came to Paris with two major aims: first, a more complete recognition of the status of their nation as a Great Power on a plane of equality with the others, and second, acquisition of Shantung and the German islands in the North Pacific Ocean. Sphinx-like and reticent they participated but little in the resettlement of Europe, but where their own interests were involved they stood ready to fight for their claims even to the extent of threatening to leave the Conference.

In addition to these aims and interests of the Great Powers there was another grave obstacle to the realization of a Wilsonian peace, namely, the inordinate ambitions and conflicting claims of the smaller nations now newly vindicated, emancipated or unified The representatives of Belgium, Paderewski (the pianist premier of Poland), Bratiano of Rumania, Pasitch of Serbia, and the gifted Venizelos of Greece, all asked for territory which could only be assigned to them on the inveterate, but, to Wilson's mind, iniquitous principle of the division of the spoils among the victors. It was partly because of these overweening pretensions on the part of the smaller states that Wilson agreed to their exclusion from the Supreme Council of the Allies which directed the Conference.

The Russian Problem. The vexatious and long unsolved problem of Russia rose to confront the Supreme Council during the early weeks of the Conference The danger of Bolshevism loomed large on the Eastern horizon, for despite the ring of domestic and foreign enemies which surrounded them the Communists had managed to maintain their position Though they were generally regarded as traitors and outlaws, the inherent difficulties of the problem of dealing with them were rendered still more complicated by the divergent aims and sympathies of the Allies. Early in January, the French, mindful of the billions of francs which they had invested in Russia, urged the utilization of the combined resources of the several countries to overthrow the Bolshevist régime; but the United States and Great Britain refused to furnish any troops for this enterprise President Wilson strongly opposed Foch's plan for sending troops to Poland, saying he had great doubts whether the spread of Bolshevism could be checked by the use of armed force He and Lloyd George suggested a plan for holding a conference with the various Russian factions including the de facto Bolshevist government. Clemenceau refusing to have his capital contaminated, the place and date of meeting were set for the island of Prinkipo in the Sea of Marmora in February, but to the ill-concealed joy of the French the project fell through owing to the contemptuous refusal of the counter-revolutionary leaders Denikin and Kolchak to consider any proposal for a truce and a conference During the several subsequent months the British and the Americans, recognizing the danger of a policy of drift, persisted in their endeavor to make some sort of a settlement regarding Russia, but due to diplomatic tactlessness on the part of the Bolshevists, hostile comment in the Allied press, the vacillation of Lloyd George in the face of this comment, and the unbending rigor of official France, nothing was accomplished, and the Allies finally reverted to the policy of supporting the royalist counter-revolutionists. Much valuable time had been wasted and meanwhile the tide of Bolshevism seemed to be sweeping irresistibly westward, into Hungary, into Austria, into Bavaria The Conference lived throughout under the menacing shadow of impending revolution.

The League of Nations. One of the earliest and perhaps the most vital of the many struggles

at the Peace Conference was the effort to bring into being a League of Nations and relate it definitely to the Treaty of Peace. (See LEAGUE OF NATIONS.) The French were desirous of postponing consideration of a League until the material problems of peace had been settled—new states, boundaries, colonies, disarmament of the enemy, and indemnity. But Wilson placed the league project first on his list of subjects, and in compliance with his demand the Council of Ten passed a resolution on January 22, sanctioning the creation of a League which should be incorporated "in the general treaty of peace." This resolution was approved by the second plenary session on January 25, and a commission constituted to draft a covenant for the proposed league.

On January 23 Lloyd George, supported by Clemenceau and Sonnino, precipitated an acrimonious discussion of the disposition of the German colonies and the dismemberment of Turkey, which consumed the greater part of a week and generated much heat and bitterness. German sea-power and economic rivalry having been crushed, the British moved quickly to their next objective—the division of the spoils of war Wilson vigorously opposed the move, but had to compromise. It was agreed (January 24) that the colonies should not be restored to Germany, though on the question of future control grave differences of opinion developed. The British premier and the Dominion prime ministers demanded outright annexation of the territories which the secret treaties assigned to the British Empire. On the 27th, the Japanese announced their unconditional claim to Shantung and the North Pacific islands as per secret treaty engagements. On the 28th, the French demanded annexation "pure and simple" of Togoland and the Cameroons, basing their claims in part upon the existence of secret arrangements with Great Britain and requesting that France "be allowed to continue her work of civilization in tropical Africa." Belgium presently intimated a desire for territorial increases in Africa, and Italy put forward provisional claims based upon the secret treaty of London. Wilson adhering to his programme of "self-determination" with "no annexations" proposed that the areas in question should be held in "trusteeship by the League of Nations through the appointment of mandatories." Smuts of South Africa had originally proposed the application of the mandatory principle to the Turkish and Hapsburg Empires, but Wilson in adopting his suggestion widened its application, thereby incurring bitter attacks in the French press which denounced him and his "impracticable ideals." The British shifted their attack, accepted the mandatory scheme in principle and attempted to have a preliminary allocation of colonies made before the League came into existence. Hughes of Australia and Massey of New Zealand now uttered a virtual ultimatum, but Wilson stood adamant, and consideration of the problem was postponed pending the drafting of the League Covenant, work upon which was expedited during the first two weeks of February. Simultaneously other commissions which had been appointed, such as those on various territorial problems, responsibility for the War, reparations, etc., immediately commenced their arduous task of preparing the formulas of settlement.

Following the plenary session of February 14, there was a month's interregnum due to the absence of the "Big Four." Lloyd George was absent from the Conference from February 7 to March 5. His place was temporarily taken by Winston Churchill, perhaps the most militaristic and ultra-imperialistic member of the British cabinet. Mr. Wilson, who left for America on February 14, to attend to administrative duties, did not return to Paris until March 14. Premier Clemenceau, wounded by a French anarchist on February 19, was confined to his home until March 10. Premier Orlando went to Italy for some time leaving his more reactionary colleague Sonnino in control.

During the week before his departure, especially on February 7, and February 12, Wilson advocated the immediate imposition upon Germany of military and naval terms providing for her disarmament as a preliminary preparation for Allied demobilization. This would separate military terms from general considerations of peace and tend to remove the Conference from the militarist atmosphere created by the maintenance of large standing armies. Clemenceau bitterly denounced this plan. He desired expansion of the old conditions for Germany but not demobilization for the Allied armies. Balfour of Great Britain supported the President in resolutions renewing the old armistice terms for an indefinite period and providing for a preliminary treaty containing the military, naval and air terms to be drafted immediately by a committee of military experts during Wilson's absence in America. But those delegates who favored imposing general territorial and reparation terms on Germany before considering a League of Nations took advantage of the situation to sidetrack the League project and work for the expansion of the preliminary military, naval and air treaty authorized by the resolution of February 12, into a general settlement. On February 22, Mr. Balfour, responding to pressure by Churchill, introduced a new resolution providing for a preliminary peace treaty with Germany which should include, besides disarmament clauses, the approximate future frontiers of Germany, financial arrangements, post-war economic relations, and responsibility for breaches of the Laws of War. The various commissions which had been constituted to investigate these matters were directed to report not later than March 8 (one week before Wilson's expected return). This resolution received the cordial endorsement of the French and the Japanese. Baron Sonnino of Italy favored the principle though he was averse to having the German settlements made before Italian claims to Austrian territory were satisfied. Mr. Lansing and Colonel House of the American delegation, desirous of securing a speedy peace, acted against their absent chief's wishes and assented to the project. Lord Milner of the British delegation alone opposed the move, but in vain. The foes of the League secretly rejoiced at this victory, and it was openly declared that the League was shelved. On March 1, Marshal Foch presented a report on the military terms of the Treaty. No sooner, however, had the Council of Ten resolved to frame a general preliminary treaty of peace omitting the League than difficulties were encountered. All sorts of controversies began to crop out. The British and the French differed about the disposition of the German war vessels, the British and Japanese about former German cables. Lloyd George no sooner returned to Paris than he had a falling-

out with Clemenceau. To make matters worse, the Italians objected very vociferously to a quick peace with Germany which left Austrian problems in abeyance.

Such was the situation upon the return of President Wilson to Paris on March 14. In many respects his visit home had been discouraging, for he had learned that he could not count with certainty upon the American people's support of his peace programme Circumstances demanding decisive action on his part, the very next day he issued a strong proclamation repudiating American support of the scheme for a preliminary comprehensive peace settlement without the League and announcing that the resolution adopted at the second plenary session on January 25 to the effect that the League should be made an integral part of the general treaty of peace, was of final force

Reports of commissions—territorial and other —were now being received, but they had been prepared for the most part by subordinate members of the various delegations without supervision or direction on the part of the chief plenipotentiaries. The time was rapidly approaching when formal decisions had to be reached on questions on which it was known that grave differences existed among the various statesmen. Secrecy was deemed an essential condition for the arrangement of those compromises by which alone amity and unanimity could be preserved. Many complaints had arisen about the delay of making peace and the slow progress of the Conference seemed to necessitate a radical reorganization of the form and procedure of the Supreme Council Under pressure of the British delegates it was decided about the third week of March to substitute a Council of the Heads of the Four Great Powers of France, Italy, the United States, and Great Britain for the larger and more unwieldy Council of Ten Definite announcement of the change was made on March 25. Marquis Saionji, the head of the Japanese delegation might have claimed a seat in this conclave but abstained from so doing except when his nation's interests were specifically involved on the ground of his ignorance of European languages The foreign ministers who had been members of the Council of Ten henceforth met separately as a subordinate Council of Five to which was intrusted decisions on matters of secondary importance, preliminary preparation of miscellaneous material for the consideration of the Supreme Council of Four and the execution of numerous administrative tasks which had formerly consumed the time and energy of the old Supreme Council of Ten

From March 25 to May 7 the Four worked at high pressure to complete the German treaty. Meeting two or three times a day they decided questions of principle and high policy, consulting the experts on technical points and details of the subjects discussed. The intensified secrecy of their procedure reacted upon the press and public to produce considerable irritation and much confusion Its sole justification was that it concentrated power in the hands of responsible statesmen and promised a more expeditious settlement.

The French Demands. The somewhat cool reception which Wilson had encountered at home did not pass unnoticed in Europe Clemenceau and Lloyd George undoubtedly felt that Wilson's domestic support was so unstable that they who could point to the tangible popular mandates of victorious elections and votes of confidence were justified in adopting a stronger tone. These three chief conferees now faced in all its acuteness the problem of finding some basis of unity among themselves upon which the terms of the peace settlement might rest. In January Wilson had insisted upon immediate steps toward the creation of a League of Nations The French now resolved to carry through in its entirety their formidable programme of security, reparation, and expansion It embraced the following points: (1) French military control of the Rhine; (2) a permanent alliance of the Great Powers to help France hold it, (3) erection of a group of smaller allies to menace Germany from the East; (4) territorial reduction of the German Empire; (5) crippling of the German political organization through the encouragement of separatist movements; (6) disarmament of Germany but not of the Allies; (7) a crushing indemnity to cover not merely restoration of northern France but as much of the French war debt as possible, (8) appropriation of German economic resources; (9) a set of commercial agreements preferential to France, prejudicial to Germany In addition the French were determined to acquire a large share of the economic opportunities of developing parts of Turkey and the former German colonies

Wilson recognized that his programme of permanent world peace based upon sound moral principles backed by mutual guarantees was seriously jeopardized by the French demands He had upset many plans on March 15, by declaring that the League must be an integral part of the Treaty. He consistently opposed Marshal Foch's projects of sending military expeditions to coerce Soviet Russia, and on March 17, during the final consideration of the military, naval and air terms of the Treaty, caused the rejection of an elaborate scheme advanced by the French for perpetual control over the military and naval affairs of Germany. Shortly afterwards he was instrumental in again defeating, in the League of Nations Commission, the plan sponsored by M Bourgeois to make the League practically a military alliance for the defense of France. In addition, while on his way back to France he had refused, by wireless, to consent to the French proposal to include the entire costs of the War in Germany's reparations bill. Such actions, though maintaining his position, served to irritate and consolidate the opposition.

The French determined not to yield on any more points. Though unanimously assured of the return of Alsace-Lorraine, political, military, and economic motives impelled them to demand a more complete "rectification" of their eastern frontier The secret agreement of February, 1917, with Russia had assigned them, first, outright annexation of the entire iron district of Lorraine and the entire coal district of the Saar Valley, and, second, the separation from Germany of the remaining territories on the left bank of the Rhine and their erection into an autonomous neutral state to be occupied by French troops pending final fulfillment of all conditions of peace to be imposed upon the enemy With minor modifications the execution of their agreement together with a proposal for an indefinitely extended inter-Allied control of the Rhine bridges was vigorously advocated by the French delegation at the Conference, and the debate on this subject of fundamental importance was keen and protracted,

lasting off and on for the first six months of 1919. On March 14, Wilson and Lloyd George offered to pledge their respective countries to aid the French in case of an unprovoked attack by Germany. Clemenceau accepted this extraordinary guarantee with much gratitude, but insisted that it supplement rather than supersede the French plan for indefinite occupation of the Left Bank and military control of the Rhine. On March 27, the French finally presented their definitive claim to the Saar, pared down to an irreducible minimum providing first for political annexation of that part of the Saar basin which had belonged to France under the frontier of 1814 but had been relinquished to Prussia as an additional penalty after Napoleon's débâcle at Waterloo, and, second, for full French ownership of the mines in the adjoining regions. The whole controversy on this issue, together with disputes about reparation, amendments to the covenant of the League of Nations, and other points, came to a head late in March. From March 25 to April 7, the Conference seemed to have reached a standstill as the major plenipotentiaries battled for supremacy Affairs had reached an impasse

Working in supposedly strict secrecy, the Council of Four struggled frantically to discover some working arrangement. American experts had recommended granting a portion of the Saar region to France as compensation for the wanton destruction by the Germans of mines in northeastern France. Wilson readily acknowledged the validity of French claims to coal from the Saar, and was early convinced that transfer of the mines was the surest method of just compensation, but could not be brought to consent to French annexation of any part of the Saar or to political separation of the Left Bank from Germany. The British, though sympathetic with French desire for security, unrelentingly opposed a separate buffer state on the Rhine. As regards the Saar they favored the transfer of the mines but instead of direct annexation preferred the creation of a larger autonomous state under French protection To the anger of the French, Lloyd George, in a memorandum circulated on March 25, protested that the Treaty as it was being framed could only operate to cause new and more terrible wars in the future and made a strong plea for moderation and justice in territorial readjustments. Clemenceau in a biting and sarcastic reply complained that all of Lloyd George's proposed concessions were in military and European matters at the expense of French security, not in naval or colonial matters at the expense of British security or aggrandizement.

The opening days of April have truly merited the caption "the Peace Conference's blackest hour." In the Council of Four, Clemenceau was at loggerheads with Wilson and Lloyd George and threatened to resign unless his demands were granted. His fall would probably have resulted in an even more obstinate French resistance. In the sessions of the League of Nations Commission the French were insisting on the adoption of amendments favoring militarization of the League and the maintenance of French security There were grave premonitory rumblings of future disputes with the Italians and Japanese over their respective territorial claims. The inspired French press and certain sections of the English and Italian press uniting in a vituperative attack upon Wilson and to some extent upon Lloyd George, anathematized the former as a pro-German and the sole obstacle to a speedy and satisfactory peace. On April 3, the President succumbed to physical exhaustion and for four days was confined to his bed. On April 4, came news of renewed disorders and aggressive Bolshevist projects in Hungary; on the same day King Albert of Belgium arrived to insist upon Belgian priority in reparations payments. On April 5, it was learned that Bavaria had embraced Bolshevism and on the sixth there were socialist demonstrations in the streets of Paris

Wilson determined to force a showdown. His first action upon leaving his sick-bed was to order the *George Washington* to sail for Brest immediately. This was his ultimatum: either the French had to recede from their extreme demands or he would leave the Conference. The result was an era of compromise Working under the necessity of preserving Allied solidarity and preventing a disruption of the Conference, Wilson and Clemenceau gradually fought out the problems of French security and reparation. On April 10, a solution of the Saar Basin (q.v.) question was attained. The mines were to be given outright to the French, but politically the region was to be administered for 15 years by a special League of Nations Commission after which a plebiscite was to determine its future status. On April 16, Wilson and Lloyd George agreed to a 15-year occupation of the Left Bank of the Rhine, together with Allied control of the three principal bridge-heads, the demilitarization of all this territory and also of a zone stretching 50 kilometers east of the river. Simultaneously it was definitely decided to sign the three-power defensive alliance as an additional guarantee of French security, though in so doing, Wilson laid himself open to serious charges of inconsistency as he had hitherto opposed special alliances within the general family of the League of Nations Meanwhile in the final sessions of the League Commission, April 10 and 11, Wilson carried through certain American amendments that he considered necessary to meet domestic opposition but with Clemenceau's consent the proposed French amendments were rejected On April 12, a compromise was reached on the reparations issue (see REPARATIONS). These decisions in regard to reparations, the Saar Valley, and the Left Bank of the Rhine completed the main outlines of the settlement with France. Though the worst period of the crisis was thereby weathered the compromises on these vital issues satisfied no nation and extraordinary attempts were subsequently made to evade or modify them, for the French never stopped fighting for their full programme, and the British and the Americans, regretting their concessions, endeavored to secure a reconsideration. However, by April 14, sufficiently comprehensive agreements had been reached by Wilson, Clemenceau, and Lloyd George to justify summoning the German delegation to Versailles But three weeks were yet to elapse before the tentative draft treaty was completed and submitted to the enemy plenipotentiaries, for barely had the worst period of the French crisis been safely weathered when another storm—the Italian crisis—burst upon the Conference.

The Italian Demands. The Italians had been growing restive under the apprehension that the German terms would be settled before they had a chance to bargain for concessions in

the Adriatic, Asia Minor and elsewhere as the price of their approval of the settlement. Italian claims for territory were based primarily upon the secret treaty of London of April, 1915, by which Italy was promised the southern part of Austrian Tirol, up to Brenner Pass and including the Bozen district with some 200,000 Austro-Germans in addition to the ethnographically Italian region of Trentino; also Trieste; Gorizia, Gradisca, and Istria, a majority of whose inhabitants were Slavic; part of Dalmatia with all the best harbors except Fiume on the eastern side of the Adriatic; the town and district of Valona in Albania; the Dodecanese Islands in the Eastern Mediterranean, wholly inhabited by Greeks; imperialistic compensation in Africa and Asia Minor; and "a share of the war-indemnity." Subsequent secret arrangements, notably that of St. Jean de Maurienne in April, 1917, had elaborated prospective Italian gains in the Turkish Empire. The Treaty of London, as its terms gradually became known, had a poisoning and disillusioning effect all through the Balkans, and proved to be one of the chief obstacles to a speedy and satisfactory settlement at Paris. "More actual time was devoted by the Council of Four and other councils and commissions to the controversies which raged around this treaty than to any other single subject discussed." In a session of the Supreme War Council on Nov. 4, 1918, at the time of the armistice negotiations, Premier Orlando had made a reservation on Point Nine of Wilson's Fourteen regarding the readjustment of Italian frontiers "along clearly recognizable lines of nationality," but this was not incorporated in the note to Germany on November 5, on the ground that it concerned the peace with Austria-Hungary, not with Germany. The Italians not only refused to abide by the Fourteen Points, but went a step beyond the Treaty of London and claimed in addition the Port of Fiume, the annexation of which they had expressly, though it appears unwillingly, renounced in 1915 At that time it was agreed to offer Fiume to Croatia, Serbia, and Montenegro as compensation for certain sacrifices of Serbian territory to be utilized in enticing Bulgaria into the War on the side of the Allies The latter project falling through, Italy revived her claim to Fiume in order to secure undisputed economic domination of the Adriatic and to prevent any potential rivalry on the part of Jugo-Slavia.

The attitudes of the Big Three toward Italian aspirations were very divergent. Sympathizing with the Jugo-Slavs, Wilson desperately endeavored to attain settlements not only just in themselves but based upon a broad and generous programme of coöperation. Clemenceau and Lloyd George, entangled in the commitments of the secret treaties, tended to recognize the obligations they had thereby incurred though opposing undue greediness on Italy's part. The scholarly and impulsive Orlando and the grim-faced Sonnino, so dissimilar in temperament and training, lacked sufficient unity of purpose and method to secure any substantial diplomatic victory. Hitherto somewhat in abeyance, the Italian claims were taken up in real earnest about the middle of April. Experts of the various delegations prepared reports and recommendations. Wilson intimated to Orlando that he would accept the northern frontier assigned by the Treaty of London and also Italian annexation of Lissa and Valona, but demanded that as the natural outlet for the trade of Jugo-Slavia and Austria, Fiume should be made a free city within the Jugo-Slav customs area. Advocating the assignment of Dalmatia to Jugo-Slavia under guarantees protecting the rights of Italian minorities therein, he rejected a proposal subsequently made by Clemenceau and Lloyd George to award Fiume to Italy if she renounced treaty claims upon Dalmatia. From April 19 to 23, stormy discussions raged upon various phases of the problem. On April 20, Wilson read a memorandum setting forth his views which he proposed to publish if the Italians rejected all compromise. The British and French premiers approved the memorandum and Wilson evidently understood both of them to favor publication. On April 23, Orlando having refused to participate in any further deliberations until the question was settled in Italy's favor, Wilson caused a tremendous sensation throughout the world by publishing an appeal to the Italian people over the heads of their duly authorized representatives. The outraged Orlando threatened to go home and lay the matter before Parliament. To his surprise Wilson eagerly supported the proposal and to save their faces the Italians had to go, receiving cold comfort from Lloyd George and Clemenceau who informed Orlando in a secret memorandum that although against their better judgment they would stand by the Treaty of London they could not admit the justice of the Italian claim in Fiume. This second memorandum, if published, would have completely isolated the Italians, but due to Lloyd George's temporizing it was suppressed, and Italian public opinion skillfully manipulated to confuse the issues and injure Wilson. In the Supreme Council, Lloyd George pressed for compromise and concessions, bringing up the broad subject of spheres of influence in Turkey. But other problems required attention; it was necessary to go on with the work in hand. Though receiving a vote of confidence in his parliament on April 30, the Italian premier, recognizing the futility of further abstention from the proceedings, left Rome for Paris on May 5. The Adriatic question was still undecided. For its ultimate settlement, see FIUME-ADRIATIC CONTROVERSY

The Japanese Demands. Contemporaneously with the Italian crisis over Fiume, there had taken place a sharp encounter with the Japanese over Shantung. The Mikado's representatives had hitherto confined themselves largely to silent observation of the wranglings of other nations and to a protracted though fruitless effort to secure insertion in the League of Nations Covenant of the principles of racial equality. Smarting under their defeat on this issue, the Japanese began strenuously to urge their claims to imperialistic aggrandizement in the Far East. Their diplomatic position was well-nigh impregnable. A secret agreement with Great Britain of February, 1917, subsequently approved by France, Russia, and Italy, assured Japan of the acquisition of Germany's rights in Shantung, and island possessions in the North Pacific, those south of the Equator being assigned to the British. Several secret agreements negotiated with China at the point of the bayonet in 1915 and September, 1918, had secured reluctant Chinese assent to the Japanese plan for eventual restoration of Shantung to China only upon conditions favoring the enhancement of Japanese interests in Shantung and Manchuria. The

Chinese having consented to these arrangements only under duress (see CHINA, *History*, and JAPAN, *History*) now asked the complete abrogation of all these old treaties and the direct restoration of Shantung without the intermediation or interference of the Japanese. The Japanese, bitterly denouncing Chinese participation in the discussion of their claims, and grimly resolved to stand their ground, demanded the absolute surrender to themselves of the former German "rights, privileges and concessions" in Shantung, after which they were to be left free to carry out the provisions of the treaty of 1915 and the arrangements of 1918. They summarily rejected a proposal made by Secretary Lansing in the Council of Foreign Ministers on April 15, and strongly supported by President Wilson in the Council of Four, providing for the blanket cession of all German rights in China to the Allied and Associated Powers for subsequent disposition. Lloyd George adduced the secret treaty of 1917 in justifying the Japanese claims, but his loosely made suggestion for a League of Nations mandate for Shantung was rebuffed by them. The Japanese peremptorily demanded an immediate and definite settlement of the problem in accordance with their stipulations since otherwise they had strict orders from home not to sign the treaty. The departure of the Italians redoubled the gravity and effectiveness of their threat to leave the Conference. The Belgians were simultaneously manifesting discontent over the reparations settlement and a complete break-up again seemed imminent. Against the strong advice of his advisers and fellow-plenipotentiaries, including Secretary Lansing and General Bliss, Wilson finally decided to yield to the practical considerations of the moment and on April 30, it was agreed that Shantung should be ceded to Japan in the actual Treaty, but that Japan in a supplementary verbal agreement was specifically to reaffirm her promise to return it to China under more explicitly defined conditions. This compromise solution saved the day, but was satisfactory to no one except the Japanese It embittered the Chinese and led to their refusal to sign the treaty. It disheartened Wilson more than any other decision at the Conference. It stirred up great criticism in America and furnished a formidable weapon of opposition to the Treaty there. Not until the time of the Washington Conference was an amelioration of the settlement made which mollified the United States and China. (See SHANTUNG and WASHINGTON CONFERENCE.)

The Polish Demands. On the contentious issues of Fiume and Shantung, Wilson received scant support from his colleagues in the Council of Four, but when it came to the extravagant Polish demands supported by the French, Lloyd George entered the diplomatic lists in the guise of an embattled advocate of justice and moderation. In 1917 France in her secret arrangements with Russia had agreed to allow the Czar's government a free hand in drawing Germany's western boundaries, i.e. in annexing Prussian and Austrian Poland. But the advent of revolution in Russia and the subsequent régime of the Bolsheviks profoundly altered French policy. Having lost their powerful ally in the East and being interested in the creation of a ring of buffer states around Germany, the French argued for a great and strong Poland, which would not only hem in the Germans on the East but also form a link in the *cordon sanitaire* to be forged around Bolshevist Russia. The British, while committed to the restoration of Polish statehood, refused to countenance the projects of aggrandizement advanced by the Poles and the French, as they served no direct British interest and promised to cause unrest and possibly war in Eastern Europe. The Territorial Commission appointed to consider the problem of Poland recommended the cession to her of almost the whole of the Provinces of Posen and West Prussia which had anciently constituted parts of the Kingdom of Poland, together with the district of Marienwerder controlling the railroad from Danzig to Warsaw. Poland was also to get the greater part of Upper Silesia, which had not been Polish for centuries. Mr. Lloyd George strongly opposed the transfer of 2,000,000 Germans to Polish rule and, supported by President Wilson, he secured a decision allowing a plebiscite in Marienwerder, and making Danzig a free city under the League of Nations though subject to Poland in customs regulations and conduct of foreign relations.

The essential terms of the treaty were now complete. On April 28, at the fifth plenary session, the League of Nations Covenant and the International Labor Charter were adopted by the Conference, and on May 6, despite a strong undercurrent of dissatisfaction among the smaller powers "with special interests" who felt that their views had not been sufficiently considered, a summary digest of the whole treaty was read and approved

German Reception of the Treaty. Headed by Count Brockdorff-Rantzau, foreign secretary of the republican government at Berlin, the German plenipotentiaries arrived at Versailles on April 29. Here, on May 7, the Preliminary Conference was transformed into a definitive Peace Congress and at a ceremonial meeting the proposed treaty was formally transmitted to the German delegation by Clemenceau whose tart speech declaring that the war had cost the victors too much to allow the remission of any precautions or guarantees necessary to ensure a lasting peace, elicited from Brockdorff-Rantzau an extremely defiant and tactless reply marked by bitter denunciation of the Allies and a vigorous denial that Germany was solely responsible for the war.

Seven weeks of uncertainty ensued, taken up with the analysis of German protests, the formulation of the Austrian peace treaty (see below), and the last great crisis that preceded the signature. Oral discussion being barred, the Germans, commencing May 10, submitted an extended series of notes criticizing various parts of the Treaty, and on May 29 advanced an elaborate set of counter-proposals. Complaining that the principles of the Armistice under which Germany had laid down her arms had been violated in letter and spirit, they asserted that the terms imposed upon their now thoroughly democratic government were intolerably severe. They demanded a plebiscite to determine the future status of Alsace-Lorraine, and suggested that instead of ceding West Prussia, Danzig, and Memel they should be allowed to make Danzig, Königsberg, and Memel free ports under German sovereignty. They offered fixed annual supplies of coal to France in lieu of the Saar mines and argued that the retention of Upper Silesia was absolutely necessary if Germany were to fulfill her obligations. They requested

that Germany be admitted to the League of Nations immediately without conditions, and proposed that she retain her colonies under a League mandate. They advocated general instead of unilateral disarmament and asked the Allies to abolish compulsory military service in two years.

These and numerous other suggested changes and interpretations were considered by the Allied Councils and 13 special committees Of great significance was an eleventh-hour attempt on the part of Lloyd George to secure modification of the terms of peace. Publication of a digest of the treaty had elicited vociferous denunciation of its provisions in liberal and labor circles in Great Britain and to some extent in the United States Certain plenipotentiaries and experts in the British and American delegations at Paris were emphatic in their criticisms Mr. John Meynard Keynes, a financial adviser on the British staff, resigned in protest, as did likewise Mr. William C. Bullitt of the American commission. In Germany all parties denounced the treaty and huge demonstrations of protest led to increasing anxiety about its possible rejection Alarmed by the spread of dissatisfaction and fearful lest the Germans would refuse to sign, the consummate politician, Lloyd George, who on May 9 had been stronger than any of the others for coercion, swung suddenly toward the other extreme and began to demand somewhat radical revisions of the Treaty. He particularly attacked the provisions regarding the army of occupation and the Silesian settlement Clemenceau criticized in France for having already yielded too much, convinced as always that the Germans understood nothing but force, and believing that once a few concessions were made they would insolently demand more, bristled with opposition and refused to agree to a reconsideration Lloyd George turned to the Americans for support Wilson having struggled all through the Conference to abate excessive British, French, Italian, Japanese, and Polish demands, was not impressed by the British premier's periodic conversions to wisdom and sanity. On June 1, Lloyd George consulted his cabinet at a special meeting convened in Paris, and the very next day he threatened to go home and lay the whole matter before Parliament if Clemenceau did not consent to changes. The French premier, himself facing a ministerial crisis, declined to budge. Wilson, at a special meeting of the American delegation on June 3, announced that he was strongly in favor of making any changes that would ensure more complete justice, but he opposed granting any last minute concessions merely to placate the enemy. He feared that the resumption of conversation about French security and other points would imperil the whole delicate structure of the settlement. With the President's consent the American experts did urge that a definite and moderate sum of reparation be fixed; but Lloyd George, remembering his election pledge about recovering the costs of the war—some $120,000,000,000—frankly opposed the move. On June 16, however, he secured a convention providing for supreme civil rather than military control of the occupied territory and a declaration limiting the cost of the Army of Occupation to be assessed upon the enemy The Allied reply to the German observations on the conditions of the Peace which was dispatched on the same day, registered certain additional modifications including the requirement of a plebiscite for Upper Silesia, a slight readjustment of Poland's western frontier, a retardation of the required reduction of the German army, and a provision for the collaboration of a German commission in discussing methods of reparation payments. Despite these concessions the Allied reply was in effect an ultimatum calling for Germany's acceptance or refusal on or before June 23.

The return of the German delegates from Versailles with the modified treaty conditions precipitated a ministerial crisis at Berlin The Scheidemann government which had fomented resistance to the treaty, and threatened not to accept it, resigned on June 21, and was replaced by a transitional ministry under Adolph Bauer pledged to acceptance of the treaty An effort to secure the omission of the articles requiring the confession of war guilt and the surrender of war criminals met with an absolute refusal by the Supreme Council to consider any further modifications and a demand for immediate compliance Marshal Foch was ordered to advance on Berlin with the Allied armies should the German government not submit within the time limit, and preparations were made for tightening the blockade. The Germans reluctantly gave way. On June 23, the National Assembly at Weimar voted 237 to 138 to accept the treaty unconditionally and the next day the Allied Supreme Council was informed of the fact. Dr Hermann Muller, the new foreign secretary, and Dr Johannes Bell, colonial secretary, were prevailed upon to act as plenipotentiaries in place of Brockdorff-Rantzau and his colleagues. On June 28, 1919, five years to a day after the assassination of the Austrian Archduke Francis Ferdinand, the two representatives of the new German Republic attached their signatures to the Treaty of Versailles which, being signed by the delegates of all the Allied nations except China, officially terminated the Great War.

Attacks on the Treaty. The Treaty of Versailles met with a mixed reception in all quarters of the world. It was no peace of reconciliation—in some respects it was a peace of vengeance, for the legacy of hatred left by the war had proved exceedingly potent There were liberals and radicals everywhere who vehemently assailed the Treaty as an "iniquitous document," a surrender to the forces of reaction, "a crime against civilization"; there were nationalists, and imperialists and militarists in every country who scored the leniency of the terms and denounced their respective plenipotentiaries for sacrificing legitimate national interests in return for vague assurances of international cooperation. Many Frenchmen were incensed because their demands for a Rhine frontier had been negatived; certain Belgians complained about the failure of the Conference to arrange to have Holland cede them the left bank of the Scheldt; the great mass of Italians were embittered by the defeat of some of their more extreme projects of aggrandizement in the Adriatic; the Chinese, as we have seen, refused to sign the Treaty because of the unjust Shantung settlement. General Smuts of South Africa, while attaching his signature, openly protested in Wilsonian phraseology against the severity of the terms. Mr. Wilson himself, who had struggled so sincerely for a settlement of a different type, now became an ardent defender of the Treaty, being convinced that it was the

best obtainable under the circumstances. The Treaty was perforce promptly sanctioned by the German National Assembly, which ratified it on July 7. Most of the other nations accepted it at intervals throughout the year, and on Jan 10, 1920, an exchange of ratifications between the Allies and Germany was effected at Paris But among the Great Powers the United States conspicuously abstained from ratifying the treaties and eventually made a separate peace settlement with Germany. (See UNITED STATES, *History*) Thus the three-power defensive pact with France and Great Britain for the maintenance of French security which was signed at the same time as the Versailles Treaty lapsed, for although the Anglo-French treaty had been ratified by the British it was not to come into effect until the ratification of its Franco-American counterpart.

THE TREATY OF VERSAILLES

The Treaty of Versailles, as signed on June 28, 1919, revolutionized the international status of Germany, territorially, politically, militarily and economically. By its terms Germany lost her navy, her merchant marine, her colonial empire, invaluable natural resources; and her army was reduced to impotence. The first 26 articles of the Treaty constituted the Covenant of the League of Nations, but from this Germany was to be temporarily excluded. (See LEAGUE OF NATIONS.) The rest of the large-sized volume of 440 articles and annexes set forth more specific conditions of peace.

Political Terms. Germany recognized the complete independence and unconditional sovereignty of Belgium, Poland, Czecho-Slovakia, and German Austria, denounced the treaties of Brest–Litovsk and Bucharest, and agreed to allow the Allies carte blanche in dealing with Russia, Turkey, Bulgaria, Hungary, and Austria.

Territorial Terms. Germany lost all of her overseas possessions and some 27,500 square miles, or a trifle over 13 per cent of her European domain. Alsace-Lorraine (q.v.) was returned to France, and the Saar Basin (q.v.) placed under a League of Nations Commission for 15 years as described above. Belgium received the small districts of Eupen (q.v.), Malmédy, and Moresnet. Under plebiscites held in February and March, 1920, to determine the status of Northern and Central Schleswig (q.v.), the former, comprising some 1537 square miles, was reunited with Denmark, but the latter remained with Germany. To Poland were ceded large parts of the provinces of Posen and West Prussia. In July, 1920, plebiscites in southern East Prussia and the Marienwerder (q.v.) district of West Prussia produced very substantial majorities for Germany. The plebiscite in Upper Silesia (q.v.) in March, 1921, gave a majority for Germany, but to the disappointment of the Germans, in October, 1921 the Council of the League of Nations, having been invited to settle the controversy, awarded the richest part of the region, some 12.55 square miles, to Poland. A small portion, 110 square miles, of Upper Silesia was ceded to Czecho Slovakia on July 28, 1920. The port of Memel (q.v.) with adjacent territory was ceded to the Allies for ultimate transfer to Lithuania. The port of Danzig was likewise ceded to the Principal Allied and Associated Powers, who in accordance with the agreement described above recognized Danzig as a free city administered under the League of Nations but subject to Polish jurisdiction as regards customs and foreign relations Germany renounced all special rights and privileges in China, Egypt, Siam, Siberia, Morocco and Turkey Her rights and privileges in Shantung were ceded to Japan (See WASHINGTON CONFERENCE for eventual Japanese settlement with China.) Germany ceded to the Principal Powers all of her remaining overseas possessions which in accordance with Article 22 of the League of Nations Covenant were to be administered by the mandatories of the League. Already on May 6, 1919, the Supreme Council had made a provisional distribution of mandates Great Britain was to receive German East Africa On May 30, however, the British government resigned to Belgium the districts of Urundi and Ruanda contiguous to Belgian Congo to be administered under separate mandate German Southwest Africa went to the British dominion of South Africa. France and Great Britain were to receive a joint mandate over Cameroon and Togoland with permission to partition them by mutual agreement German New Guinea was assigned to Australia, German Samoa to New Zealand, the island of Nauru to Great Britain, and the German islands north of the Equator to Japan. On Feb 21, 1921, President Wilson announced that the United States could not agree to have the cable centre on the island of Yap (q.v.) assigned to Japanese control and a new arrangement in regard to it was made at the time of the Washington Conference. (For account of the mandatory system see MANDATES and also LEAGUE OF NATIONS.)

Military Terms. Germany was required to abolish compulsory universal service; to reduce her army to 96,000 men and 4000 officers recruited by voluntary enlistment, to demilitarize all the territory on the Left Bank of the Rhine and also that on the right bank to a depth of 150 kilometers; to stop all importation, exportation, and nearly all production of war material; to limit her navy to six battleships, six light cruisers, and 12 torpedo boats, with no submarines, the naval personnel not to exceed 15,000 officers and men; and to abandon all military and naval aviation by Oct. 1, 1919. The execution of most of these provisions was to be supervised by an inter-Allied Commission of Control endowed with full powers of inspection and investigation. (See below, *Continuation Conferences*) In addition, she agreed to demilitarize the island of Helgoland, to open the Kiel Canal to all nations, to surrender her 14 submarine cables, and, last but not least, to permit the trial of her ex-Emperor by an international high court on the charge of "a supreme offense against international morality," and of other officials for violation of the laws and customs of war.

Economic Terms. The economic and reparation provisions of the Treaty were exceedingly drastic and constituted a perplexing problem which more than any other aspect of the Treaty of Versailles has subsequently disturbed the peace of the world. (See REPARATIONS.) In addition to paying heavy indemnities the Germans were required to grant nonreciprocal most-favored-nation treatment to the commerce of Allied nations for a period of years. As guarantees for the payment of reparations the

Allies were to maintain military occupation of the Left Bank of the Rhine and of the bridgeheads at Cologne, Coblenz and Mainz, with provisions for the evacuation of the latter three districts at five year intervals should Germany be duly fulfilling her obligations. Including the Saar Basin (742 square miles) a total area of 12,338 square miles was to be occupied by the Allies and the subsequent seizure of the Ruhr by the French in 1923 added nearly a thousand more.

THE AUSTRIAN TREATY OF ST. GERMAIN

With the signing of the Treaty of Versailles with Germany on June 28 the major task of the Peace Conference was concluded, and the most important plenipotentiaries except Premier Clemenceau departed from Paris leaving subordinate statesmen and diplomatists in charge Mr. Lansing, succeeding Mr. Wilson as head of the American delegation, stayed until July, when he withdrew, leaving Mr. Polk, Under-Secretary of State, to act for him. Mr. Balfour became the chief of the British delegation, but in September he, too, departed, surrendering the headship to Sir Eyre Crowe. Premier Orlando's cabinet had fallen from power on June 19 as a result of Italian dissatisfaction over the Adriatic negotiations and his successor, Signor Nitti, refrained from visiting Paris.

Claims of the Succession States. Although giving priority to the settlement with Germany during the first six months of 1919, the Peace Conference had simultaneously taken under consideration the problem of arranging terms of peace with Austria, Hungary, Bulgaria, and Turkey. It was planned to have the five treaties form part of the same general settlement, each beginning with the League of Nations Covenant, and employing as far as possible the same form and phraseology The second treaty to be drafted and signed was that with Austria. Italy was the only Great Power with vital interests at stake, although France was insistent on preventing the union of Austria with Germany and carried her point during the era of compromise following the French crisis in April She also favored a confederation of satellite states on the Danube to act as a bulwark against Germany in the southeast. To the numerous other "heirs of the Habsburgs," however, Czecho-Slovakia, Poland, and the Balkan Allies, the disposition of Austrian territory was of supreme importance. As a result of the nationalistic revolution in the Dual Monarchy, the division had already taken place along broad lines by the time the Peace Conference met. But problems of frontiers still remained, some of which occasioned most violent conflicts. In Silesia, Poles and Czechs struggled for the control of the district of Teschen with its invaluable coal mines. (For discussion of this problem see TESCHEN.) In the Adriatic, Italians and Jugo-Slavs came to swords' points over Dalmatia. In the Klagenfurt Basin, Italians, Jugo-Slavs, and German Austrians were ready to come to blows. The conflicting claims and charges of the various litigants, each of which viewed affairs through the colored prism of its own nationalistic ambition, rendered extremely difficult the task which confronted the Supreme Council as regards Austria in the spring of 1919. Despairing of having the disputants arrive at amicable agreements among themselves, the Council of Ten constituted territorial commissions in February, 1919 to study the boundary problems of the various states except Italy. By the time the reports of these commissions were ready the Council of Four had superseded the Ten and with few exceptions the unanimous recommendations of the commissions were approved without alteration. Over points in dispute the Four worked earnestly, paying little attention to the small states. President Wilson finally acknowledged Italy's claim to the Brenner frontier, involving though it did the expatriation of over 200,000 Germans. The approximate boundaries of Czecho-Slovakia and Jugo-Slavia were settled during May, the former being assigned regions of Bohemia inhabited by 3,000,000 Germans, the transfer being dictated by economic and strategic considerations.

Work was rushed on the Austrian treaty so that it might be in the hands of the Austrians before the treaty with Germany was signed, for each contained the provision prohibiting union of Austria with Germany, each was to contribute to the territorial resurrection of Poland, and last but not least, Italians were insistent upon a simultaneous settlement with the two countries. An incomplete draft of the treaty was presented to the seventh plenary session with the intention of communicating it to the Austrians on the following day but the plenipotentiaries of the Succession and Balkan States demanded time to study the document. Two days later at the eighth plenary session, Premier Bratiano of Rumania supported by the Polish, Czecho-Slovak and Jugo-Slav representatives protested against having the Great Powers prescribe regulations for the protection of minorities within their separate states. Mr. Wilson answered that the Principal Powers could not be expected to guarantee the independence and integrity of the new states unless the latter would on their side guarantee equality of rights to racial or religious minorities transferred to their control under the peace settlement. Rumania and Jugo-Slavia, though greatly enlarged by the new readjustments, were old states and denied the right of the Conference to limit their sovereignty by special restrictions. Mr. Venizelos of Greece suggested that a joint meeting of the Council of Four with the smaller Allies ought to be held to consider the legitimate anxieties of the latter. But all objections were overruled by Clemenceau, Lloyd George, and Wilson. The Austrian delegates had arrived at St. Germain near Paris on May 14, and on June 2, the preliminary draft of the treaty was transmitted to them. On July 20, the Supreme Council transmitted a more complete and revised draft of the treaty to the Austrians, informing them that Burgenland or German West Hungary for whose annexation they had asked would be ceded without a plebiscite. (See BURGENLAND.) The Austrians formulated and presented their observations on the revised terms on August 6, still protesting against the patent violations of the principle of self-determination. In their final reply of Sept. 2, 1919 the Allied and Associated Powers made few additional concessions—perhaps the most noteworthy being the return to Austria of the important railway junction of Radkersburg originally assigned to Jugo-Slavia. On September 8, the Austrian National Assembly authorized its delegates to sign the treaty, and this ceremony took place at St. Germain on September 10. But the opposition of Rumania and Jugo-Slavia to acceptance of Minorities Treaties to which they

would have pledged themselves by underwriting the Austrian treaty led them to refuse to sign, until some time later. Though the Austrian National Assembly had already perforce ratified the Treaty of St. Germain on October 17, ratifications were not exchanged until July, 1920.

Political and Military Terms. The Treaty of St. Germain required Austria to recognize the complete independence of Jugo-Slavia, Czecho-Slovakia, Poland and Hungary, to make liberal cessions of territory to various victorious neighbors including Italy, and to accept elaborate regulations for the protection of such racial, religious, or linguistic minorities as remained within her much-diminished territorial confines. As described above the cession of lands to Italy included not only *Italia Irredenta* but also for strategic reasons the Brenner Pass frontier in the Tirol with about 250,000 German inhabitants. One-fourth of the inhabitants of the new state of Czecho-Slovakia were Germans in Bohemia and Moravia, this violation of the principle of self-determination being motivated by economic and strategic considerations and justified on historical grounds. Eastern Galicia, inhabited by a Ruthenian majority with a strong Polish minority, had been bitterly contested between these two nationalities, and had been seized by the Poles during the Conference; it was renounced by Austria in favor of the Principal Allied and Associated Powers, who acquiesced in Poland's de facto possession of the region, without definitively settling the question of sovereignty. The Duchy of Bukovina, with 300,000 Ruthenian and 273,000 Rumanian inhabitants, was renounced by Austria in favor of Rumania. As a result of the Klagenfurt plebiscite of October, 1920, the whole of that much-contested area remained Austrian. An additional solace was the award of German West Hungary (Burgenland). Thus through revolution and dismemberment the state of Austria shrank from its pre-war expanse of 116,000 square miles to the diminutive area of 32,000 square miles. The Austrian army was reduced to 30,000 men recruited by long-term voluntary enlistments; military aëronautics were prohibited; all war vessels were surrendered and future maintenance of naval forces obviated through loss of maritime ports. Commercial clauses of general similarity to those in the Treaty of Versailles were imposed upon Austria. She was guaranteed free access to the Adriatic. A commission on which Great Britain, France, Italy, Rumania, and the riparian states were represented was established to regulate traffic on the Danube. All transferred territories were made responsible for their fair shares of the pre-war Austrian debt. Austria was obligated to pay such indemnities as might be prescribed by the International Reparation Commission, but so crippled was the new republic politically, industrially, and commercially that in a few years intervention by the League of Nations proved necessary to straighten out her finances (see LEAGUE OF NATIONS; AUSTRIA; REPARATIONS).

THE BULGARIAN TREATY OF NEUILLY

Following the settlement with Austria, the Supreme Council devoted more attention to the task of arranging peace with Bulgaria—the first of the Central Powers to lay down its arms at the end of the Great War. The protracted delay which intervened between the arrival of the Bulgarian delegation on July 26 and the formal presentation of a preliminary draft of their treaty on Sept. 19, 1919, led to considerable exasperation on the part of their truculent leader, M. Theodoroff Learning the substance of the treaty conditions from the press he lodged strenuous objections with the Supreme Council on September 2, denying that Bulgaria was the one "guilty, imperialistic and aggressive nation" in the Balkans and protesting against the violations of the principle of self-determination prefigured in the proposed dismemberment of Bulgaria. These objections to the territorial terms were reiterated in the formal observations submitted on October 24. The Bulgarians also complained about their exclusion from the League of Nations and demanded changes in the military provisions so as to permit the retention of conscription. The reply of the Supreme Council on November 3 promised speedy admission to the League but otherwise made no substantial concessions. Further remonstrances from the Bulgarians had no effect other than the issuance of an ultimatum on November 5 demanding acceptance or rejection in ten days. Meanwhile in Bulgaria a general election held in August had resulted adversely to the government and a new ministry recruited from the Agrarian party under the leadership of M. Stambulisky came into power in the midst of the agitation about the treaty. On November 13 the Bulgarians still protesting yielded to superior force. Premier Stambulisky declared that he had "no illusions" and would sign "even a bad peace." He was the sole signatory for Bulgaria when the Treaty was signed at Neuilly on November 27. Jugo-Slavia and Rumania were not permitted to sign until they had accepted the Minorities Treaties supplementary to the Austrian Treaty. Ratifications of the Treaty of Neuilly were exchanged on Aug. 9, 1920.

Many clauses of the treaty were identical with those of the Treaties of Versailles and St. Germain, notably the League of Nations Covenant, the Labor Convention, aëronautical provisions, penalties, etc. Politically, Bulgaria was required to recognize the independence of Jugo-Slavia, to renounce the benefits of the Treaties of Bucharest and Brest-Litovsk and to accept regulations for the protection of racial, national, religious, and linguistic minorities. Territorially, Bulgaria was deprived of most of her gains resulting from the Balkan Wars and all of her conquests made during the Great War. The Dobruja went to Rumania, as before 1914, leaving for future consideration the problem of inducing Rumania to relinquish such Bulgarian districts as it included. Thrace was ceded to the Principal Powers for ultimate assignment to Greece. Particularly embittering to Bulgaria was the loss of the small districts of Tsaribrod, Bosilegrad, Strumitsa, and Timok Valley—all predominantly Bulgarian but all transferred to Jugo-Slavia for strategic reasons. Jugo-Slavia had suffered grievously from Bulgarian attack and domination during the recent war, and in the bitterness of retaliation demanded other territorial annexations, but these were denied to her on ethnographic grounds. A small district of former Turkey was added to Bulgaria on the southeast. Bulgaria was obliged to abandon conscription, to reduce her army to 20,000 officers and men together with gendarmes and other police to a number not exceeding 13,000.

All war vessels except four torpedo boats and six motor boats were to be surrendered or destroyed, military aëronautics prohibited, and the manufacture of munitions strictly limited. In addition Bulgaria was to pay extensive reparations (two and a quarter billion gold francs in 37 years), supply live stock for devastated areas, and ship large allotments of coal to Jugo-Slavia annually for five years. Commercially, she agreed to give the Allied and Associated Powers most-favored-nation treatment and freedom of transit for goods and persons, receiving in return the guarantee of freedom of transit to the Ægean with which her territory was no longer contiguous.

THE HUNGARIAN TREATY OF TRIANON

The conclusion of peace with the Hungarian wing of the old Habsburg Dual Monarchy was a protracted and difficult task, complicated alike by perplexing boundary disputes among the victors and by political instability and intransigeance upon the part of the vanquished. The democratic republican régime established in Hungary by the revolution of November, 1918, was supplanted in March, 1919, by a Bolshevist dictatorship on the Russian soviet model just at the most critical moment of the Paris Peace Conference (See above) The communist leader, Bela Kun, defied the Supreme Council during the crucial months of April, May, and June However, due to the exigencies of diplomacy and the nationalistic ambitions of the Balkan Powers, early decisions were arrived at regarding the territorial dismemberment of Hungary. Great difficulty was encountered in reconciling and adjusting the divergent interests and conflicting claims of Jugo-Slavia and Rumania. The secret treaty of August, 1916, which purchased Rumania's entrance into the Great War proved a source of much bickering and bitterness Premier Bratiano of Rumania asked for the complete fulfillment of treaty stipulations, but the Big Four, arguing that all previous commitments were cancelled by Rumania's signature of the Treaty of Bucharest in May, 1918, refused to accede to his demands The Banat of Temesvar (q.v.) all of which had been assigned to Rumania by the Treaty of 1916, was now partitioned between her and Jugo Slavia Despite reiterated Rumanian claims and objections the terms of this settlement were definitely arranged in June, 1919. On June 13 the Supreme Council informed the Hungarians of the proposed cessions of territory to Rumania, Jugo-Slavia, and Czecho-Slovakia, and on July 20 as recounted above the rich district of Burgenland (German West Hungary) was promised to Austria. (For Hungarian political developments during this period, see HUNGARY.) On January 7 the Hungarian delegates, after the establishment of a home government satisfactory to the Supreme Council, arrived at Trianon, France, and here January 15 they were formally presented with a preliminary draft of their treaty the main terms of which had been ready as early as September, 1919.

Council of Ambassadors. One week later —on January 21—the Supreme Council convened for the last time and the Peace Conference of Paris was thus formally dissolved approximately one year after its sessions had begun To the Council of Allied Ambassadors in Paris was intrusted the task of completing the settlements with the remaining enemy powers of Hungary and Turkey though periodic conferences of the Allied premiers were shortly to be inaugurated for the purpose of dealing with other unliquidated problems of the peace. (See below: *Continuation Conferences.*)

On February 12, the Hungarians submitted a set of observations and counter-proposals which breathed a spirit of hostility and recalcitrance. They demanded the retention of the Czechlers (Magyars) of East Transylvania, and asked that no territories be transferred without plebiscites according the inhabitants the right of self-determination. All transferred territories were to be retained in the Hungarian customs régime for a period of years, and better safeguards provided for the protection of Hungarian minorities. The Allies were in no mood to make concessions. The strong reactionary nationalist and monarchist sentiment rampant in Hungary elicited a joint statement from Great Britain, France, and Italy on February 12 to the effect that a Habsburg restoration would ipso facto violate one of the fundamental conditions of the peace settlement and call forth condign punishment. The new parliament elected early in 1920 designated Admiral von Horthy as "Protector of the Magyar Republic" but despite the emphatic pronouncement of the Allies the monarchical character of the constitution was reaffirmed on March 23 Hungary was a kingdom without a king Such being the situation the requests of her delegates for more moderate treatment met with scant consideration. The reply of the Council of Ambassadors on May 6 contained but slight alterations though it was asseverated that the League of Nations would be free to make such minor modifications of boundaries on ethnological or economic grounds as the future might reveal as feasible or desirable. The treaty was formally signed at Trianon on June 4. Hungary ratified the treaty on Nov 13, 1920 and was admitted to the League of Nations in September, 1922

The Treaty of Trianon duplicated the main features of the Austrian treaty except as regards territorial adjustments By its terms Hungary was transformed from a maritime, imperialistic country of 125,000 square miles into a landlocked fourth-rate power of some 35,000 square miles On all sides liberal cessions were to be made to neighboring states The region of Slovakia on the southern slope of Carpathian mountains, though containing a large minority of Magyars, was incorporated in the new state of Czecho-Slovakia for economic and strategic as well as ethnic reasons To Rumania was assigned Transylvania with its compact Magyar minority in the East A broad strip of Hungarian plain was also detached to secure Rumania's railroad communications with the Danube. Of the much contested Banat of Temesvar (q.v.) Jugo-Slavia received the county of Torontal in the west, the remainder going to Rumania. Jugo-Slavia also received Croatia-Slavonia, Bosnia and Herzegovina Fiume (q v) was renounced, to be disputed by Italy and Jugo-Slavia. Likewise to Czecho-Slovakia, almost purely for strategic reasons, was given the region called sub-Carpathian Ruthenia, autonomy being stipulated for the benefit of the 572,000 inhabitants To Austria was renounced the region of Burgenland (see above) Hungary was precluded from alienating her independence except with the consent of the League Council. Compulsory military service was abolished and her army was reduced to 35,000 men together

with police to a number not exceeding 31,500. She was required to pay a reasonable sum of reparations before May 1, 1921 and such total sums in sixty semi-annual installments thereafter as might be decided upon by the Reparations Commission. All of her merchant shipping and up to 20 per cent of her river fleet were to be surrendered, an indefinite quantity of live stock was to be furnished for devastated countries; and Jugo-Slavia was to be supplied with annual allotments of coal for five years. Deprived of two-thirds of her territory and population, crippled economically and surrounded by more or less hostile states, Hungary yet constituted a potent menace to the future peace of the Balkans. Three million Magyars, now aliens in adjacent countries, created a new irredentist problem so dangerous that in 1920 the Succession States of Czecho-Slovakia, Jugo-Slavia and Rumania formed the so-called "Little Entente" to meet it—an alliance calling for the indefinite maintenance of standing armies to guard against the restoration of the Habsburgs or Hungarian war of revenge. (See LITTLE ENTENTE.)

CONTINUATION CONFERENCES, 1919–1924

The Paris Peace Conference, as we have seen, adjourned on Jan 21, 1920, before the Hungarians had decided to accept their treaty and before the Adriatic question including the problem of Fiume and the disposition of Dalmatia, Albania, and Thrace had been settled. Even more important, no agreements had been reached upon three outstanding and vital issues, viz, the terms of the treaty with Turkey, the question of future relations with Soviet Russia and the fringe of states on her western border, and the enforcement of the treaties already signed or projected, especially the Treaty of Versailles with Germany, the task of executing which embraced a whole range of subjects such as reparations, disarmament, punishment of war-criminals, plebiscites, etc. These three major problems to say nothing of a host of subsidiary and secondary issues engaged the attention of the world continuously from 1919 to 1924 and necessitated a protracted series of difficult and delicate negotiations during which the appearance of Allied unity which had been so precariously maintained hitherto was even more seriously undermined On Jan 16, 1920, pursuant to the call of President Wilson the first session of the League of Nations Council convened in Paris, but though inextricably interwoven with the terms of the peace treaties and specially devised as a convenient and indispensable instrument of international coöperation and adjustment, the League was destined to play a relatively insignificant rôle in the controversies growing out of the territorial and economic settlement. (See LEAGUE OF NATIONS) Rather the work of carrying on diplomatic arrangements at the termination of the Peace Conference devolved upon the two agencies already mentioned: the Council of Ambassadors and the Council of Allied Premiers and Foreign Ministers. These councils held a rapid succession of formal and informal conferences during the ensuing years, now dealing with Russia, now with the execution of the German Treaty, then again with Turkey, Fiume, or Upper Silesia It was impossible to confine attention to any one problem until it was solved Others simultaneously pressed for adjustment and the divergence of national interests led inevitably to the use of the traditional and time-honored diplomatic methods of quid pro quo, compromise and compensation, interjected with accusations, threats, economic retaliation, ultimatums and armed clashes. The liquidation of two of these problems, i. e. the Turkish peace and the enforcement of the treaties, is discussed below. Under RUSSIA will be found an account of the handling of the Russian problem.

THE SETTLEMENT WITH TURKEY

The Turkish Secret Treaties. Of all the spoils of the Great War, the Ottoman Empire was among the richest. "Her undeveloped wealth in minerals and fuel, her potentialities as a producer of foodstuffs, cotton, and other agricultural products, her possibilities as a market —these were alluring as war time necessities and peace-time assets. Her strategic position was of inestimable importance to any nation which hoped to establish colonial power in the eastern Mediterranean Her future as a sphere of influence promised unusual opportunities for the investment of capital and the acquisition of exclusive economic rights" A long series of secret agreements were negotiated among the Allied Powers from 1915 to 1919 concerning the future political control and economic exploitation of Turkey. In March, 1915, Russia was assured of the annexation of the Straits and of Constantinople in return for assent to the assignment of the neutral zone of Persia to Great Britain and concessions to British interests in Mesopotamia and Egypt On Apr 26, 1915, by the Treaty of London, Italy was promised, among other things, a share in the Turkish Empire equal to that of Great Britain, France, and Russia, and including the port of Adalia and its hinterland. A more specific delimitation of interests took place in 1916. On April 26, one year after the Treaty of London, France and Russia signed the secret Sazonov-Paléologue Treaty dealing with their respective interests in northern Asiatic Turkey Russia was awarded a vast domain of 60,000 square miles between the Persian frontier and the Black Sea, with immense deposits of silver, salt and copper. The French were assigned a large slice of territory reaching south and west to the Mediterranean, the exact boundaries to be arranged with the British Two weeks later on May 9, the famous Sykes-Picot Treaty prospectively partitioned the southern part of Asiatic Turkey, allotting Syria, Cilicia and Southern Armenia to France in full sovereignty and establishing a French sphere of influence over the extensive and valuable provinces of Aleppo, Damascus, Deir, and Mosul Great Britain was given complete control over the Mediterranean ports of Acre and Haifa and the region of lower Mesopotamia stretching from Bagdad to the Persian Gulf. Italy was excluded from these pacts, but learning of them in roundabout ways manifested such grave discontent that on Apr. 17, 1917, a new secret agreement, that of St Jean de Maurienne, was signed. As subsequently modified in August, 1917, it provided that Italy was to get almost complete possession of the southern half of Anatolia, including the cities of Adalia, Konia, and Smyrna, together with an extensive sphere of influence in the region northeast of Smyrna inhabited chiefly by Greeks and Turks.

Curiously enough it was at this same time that the United States entered the war and that Allied statesmen were issuing fresh declarations

of unselfish war aims. To be sure the Russian Revolution and subsequent socialistic renunciation of all imperialistic ambitions combined with growing labor unrest to complicate the situation. In his address of Jan. 5, 1918, Mr. Lloyd George, speaking for the British government, disclaimed any intention of depriving Turkey of its capital, "or of the rich and renowned lands of Asia Minor and Thrace . . . predominantly Turkish in race," but did advocate a recognition of the separate national conditions of Arabia, Armenia, Mesopotamia, Syria, and Palestine. Three days later Mr. Wilson in his Fourteen Points speech stated that the Turkish portion of the Ottoman Empire "should be assured a secure sovereignty," but that submerged nationalities should be accorded "unmolested opportunity of autonomous development" and the Dardanelles should be permanently neutralized under international guarantees. This very definite pledge formed part of the pre-Armistice agreement which both Germany and the Principal Powers agreed to be morally binding for the Peace Settlement. Secret negotiations, however, continued to vitiate professed idealism. Lloyd George's speech in addition to reassuring British labor, mollifying Indian Moslems, and supporting Wilsonian internationalism served the ulterior but no less effective purpose of intimidating the French in secret dealings with regard to Turkey. In December, 1918, Clemenceau having visited London to secure confirmation of the Sykes-Picot arrangement of 1916, Lloyd George demanded the transfer of the valuable oil region of Mosul from the projected French sphere of influence to British control and also permission to determine the future of Palestine. Secret conversations continued unknown to "allied" Italians and "associated" Americans, and on February 15, a month after the Peace Conference began, the French were eventually obliged to accept the British proposal. On Mar. 20, 1919, just on the eve of the great French crisis described above, the finely spun network of secret treaties seriously entangled the Big Four in its meshes, when in secret session of that supreme conclave Lloyd George pressed for the dismemberment of Turkey. A heated controversy ensued between the British and the French. Wilson refused to acknowledge the validity of the secret engagements and proposed a settlement on the basis of his Twelfth Point. The matter was eventually compromised by the application of the mandate principle to transferred territories.

Other disputes arose continually. Early in February, 1919, the Italian claim to the Smyrna area having lapsed owing to the failure of Russia to sanction the St. Jean de Maurienne arrangement, the Greeks put in a claim to that region and also disputed Italian occupation of the Dodecanese. Italy sent expeditions to Smyrna and otherwise showed a disposition to anticipate decisions by the Conference. But when the Italians were absent from Paris in late April and early May, 1919, during the Fiume impasse, Venizelos pressed his claim and on May 6, unknown to the Italians, secured the secret authorization of the Big Three to occupy Smyrna. This move, being duly executed in the space of a fortnight, further embittered the Italians, and contributed to arousing Turkish nationalism with the dire consequences noted below. Lloyd George advanced numerous sordid schemes for solving the Fiume situation by granting Italy concessions in Asia Minor and Africa but they all fell through. The collapse of Russia caused a long and acrimonious discussion of the future disposition of Constantinople and the Straits. France, Great Britain and Italy being seriously distrustful of one another, the United States was offered a mandate as early as February, 1919. Wilson favored the idea, but refused to pledge the American people. The subsequent course of events in America led to the abandonment of the project, caused great fluctuations in Allied policy and indefinitely delayed the signing of the Turkish Treaty. In November and December, 1919, while the Supreme Council was yet functioning, the Turkish settlement was discussed by representatives of Italy, France, and Great Britain in special conferences, and on Feb. 16, 1920 at a conference held in London, it was finally announced that Constantinople would be left under Turkish suzerainty. The work of drafting the treaty was then pushed.

The San Remo Conference. On April 24, at the Conference of San Remo the main outlines of the settlement were completed. Mandates for Syria, Cilicia, and Lebanon were promised to France; for Adalia and Rhodes to Italy; for Palestine and Mesopotamia (including Mosul) to Great Britain; and for Armenia offered first to the League of Nations and later to the United States, both refusing to accept. Simultaneously the French and British delegates at San Remo signed a secret agreement providing for an equal division of interests and exploitation in Rumania for the transfer of the formerly German owned quarter interest in Mesopotamia oil, together with a quarter interest in Anglo-Persian oil piped to the Mediterranean through territory under French mandate in return for the provision by France of pipe lines and branch railways for the movement of their oil. The terms of this agreement gradually transpired despite denials by the signatories, and on November 20, Secretary of State Colby (successor of Mr. Lansing) lodged a vigorous protest refusing to recognize the establishment of these oil monopolies in Mesopotamia and elsewhere. This merely stimulated the British to negotiate a new secret convention with France on Dec. 23, 1920, confirming the previous agreement. On May 11, the preliminary draft was handed to the Turkish delegates at Sèvres, France. Its terms produced great excitement among the Nationalists in Turkey, who, under the leadership of Mustapha Kemal Pasha, evinced a determination to defy the Allies and work for the regeneration of their country's fallen prestige and power. (See TURKEY)

Boulogne and Spa Conferences. During May and June, the Nationalists, in control of Asiatic Turkey, drove the French to the coast of Cilicia and then threatened the Straits zone. So menacing did the situation become that on June 21, the Conference of Boulogne at which were represented France, Great Britain, Italy, Japan, Belgium, and Greece, authorized the Greeks to undertake military operations against the Nationalists. At the Conference of Spa Turkish requests for modifications in the peace conditions were rejected and an ultimatum was issued to coerce the Sultan's government, whose authority, due to the nationalist revolt, now scarcely extended beyond the confines of Constantinople, where it was both bolstered up and seriously limited by Allied occupation. On Aug. 10, 1920, the Treaty was signed at Sèvres, simul-

taneously with the signature of a secret tripartite agreement among Great Britain, France, and Italy and also of a special convention between Italy and Greece. Representatives of the United States and of Hedjaz were not present, and the Jugo-Slav delegates refused to sign.

Treaty of Sèvres. By the terms of this Sèvres Settlement of Aug. 10, 1920 the century-long devolution and dismemberment of the Ottoman Empire was virtually consummated. Territorially it was reduced from its 1914 area of 710,000 square miles to a small Turkish national state confined mainly to the interior of Asia Minor and embracing an area of less than 100,000 square miles. The Arab State of the Hedjaz was emancipated from Turkish sovereignty though subjected to British control. Armenia became a free Christian Republic, her boundary with Turkey to be arbitrated by President Wilson. Palestine, including Transjordania, under a League of Nations mandate held by Great Britain, was to afford a national homeland for the Jews. Syria, with Cilicia, was likewise detached from Turkey and made a mandate of France. Southern Anatolia, including the port of Adalia, was constituted as an Italian "sphere of influence," being a sorry remnant of the princely domain marked out for Italy by the St. Jean de Maurienne agreement Smyrna and its hinterland were transferred to Greece together with Thrace, Adrianople, the peninsula of Gallipoli, and the islands of Tenedos and Imbros. By special arrangement with Italy the Dodecanese Islands in the Ægean which had been occupied by Italy since the end of the Tripolitan War in 1912, were to be yielded to Greece with the exception of Costellorizo and Rhodes whose status was to be determined by plebiscites In the case of the latter the plebiscite was to be held only in case Great Britain, whose sovereignty over Cyprus was recognized by Turkey, ceded that Island to Greece. The French protectorates over Tunisia and Morocco were validated as were also those exercised by Great Britain over Egypt and the Sudan The coasts of the Dardanelles, the Sea of Marmora, and the Bosporus were erected into a neutralized "zone of the straits" controlled by a League of Nations commission consisting of British, French, Italian, Japanese, Rumanian, Greek, and Turkish members The Capitulations which the Sultan had abrogated in 1914 were revived and amplified; Turkey was made responsible for the costs of the Allied military occupation, and her own army was to be reduced to a maximum size of 50,000 men A Financial Commission was instituted to supervise taxation, customs, loans, and currency, to control the Turkish budget, and ratify or reject proposed economic concessions and all of this was to be done in the language of the tripartite agreement, "to help Turkey, to develop her resources, and to avoid the international rivalries which have obstructed these objects in the past."

Rejection of the Sèvres Treaty. Despite the acceptance of the Treaty of Sèvres by the Sultan's government at Constantinople, the divergent interests of the Great Powers created a serious lack of unity on the Near Eastern question which proved fatal when the Turkish National Assembly at Angora refused to ratify such an unjust convention. By October, 1920, through a series of successful military campaigns (see TURKEY) Mustapha Kemal Pasha obliterated the Armenian Republic, rendered the French position in Cilicia untenable, forced the British army of occupation back into the Ismid peninsula, and compelled the Italians to withdraw their troops to Adalia. Menaced by an Arab rebellion in Syria, unable to protect Cilicia against the Nationalists, unwilling to increase the size of their Syrian military establishment which already numbered 100,000 men, dissatisfied with the distribution of spoils in the Near East, fearful of the augmenting power and prestige of British imperialism, the French decided to scrap the Treaty of Sèvres and come to terms with the Angora government of Mustapha Kemal Pasha. Having broached the project to the non-committal Lloyd George at the London Conference of February–March, 1921, they negotiated directly with the Angora delegation and on March 9, there was signed at London a Franco-Turkish agreement terminating hostilities in Cilicia. The Nationalists recognized the special social and cultural interests of France in Turkey, confirmed French interests in the Bagdad Railway and promised favorable concessions to French capitalists in Cilicia and southern Armenia. France on her part was to evacuate Cilicia, readjust the Turco-Syrian boundary, and adopt a more benevolent attitude toward the Grand National Assembly (See CILICIA; BAGDAD RAILWAY.)

The Italian situation in Turkey was also very menacing for Italian troops had been driven out of Konia and maintained but an increasingly precarious position at Adalia. The Treaty of Sèvres was distinctly unpopular in Italy for it had registered a subversion of Italian prospects in Asia Minor to the advantage of the hated Greeks Accordingly on March 13, a Turco-Italian agreement was signed at London providing for the withdrawal of Italian troops from Ottoman soil and for economic collaboration between Italy and Turkey in the Adalian hinterland, together with the granting of certain valuable concessions to Italian capitalists. The Italian Government also pledged itself to support effectively Turkish demands for untrammeled sovereignty and the restitution of Thrace and Smyrna. Their valiant resistance having elicited a sympathetic response from Bolshevist Russia, on Mar 16, 1921, the Turkish nationalists achieved another diplomatic triumph when a treaty was signed at Moscow with the Russian Socialist Federated Soviet Republic. Russia refused to recognize the validity of the Treaty of Sèvres, disavowed all imperialist ambitions in Turkey, ceded outright the Caucasian territories of Kars and Ardahan, and declared the capitulatory régime null and void as being incompatible with the autonomous national development of Turkey

Further negotiations conducted between France and Turkey during the summer of 1921 for the purpose of confirming and elaborating their March agreement culminated in the signing of the Treaty of Angora, on October 20. The British were outraged at what they termed this breach of good faith and stimulated the Greeks to renewed efforts against Turkey. The Franco-British Entente Cordiale was strained to the breaking point, not alone by antithetical policies in the Near East, but by acute differences simultaneously manifested over relations with Russia, naval disarmament, and German reparations. During the protracted and sanguine war between Greece and the Turkish Nationalists in

Asia Minor during 1921–1922, the British supported the Greeks as convenient tools for the advancement of their own interests, but the French and Italians aided and abetted the Turks even to the extent of withdrawing their troops from Constantinople. The decisive victories of Mustapha Kemal Pasha during the late summer and autumn of 1922 swept the Greeks out of Smyrna. An armistice between the Turks and the Allies was signed at Mudania, Oct. 10, 1922, permitting the former to retain Smyrna, take over the administration of Constantinople, and reoccupy Eastern Thrace, pending the formulation of a new peace treaty, to replace the thoroughly discarded Treaty of Sèvres.

Lausanne Conference. A conference of the Turks and the European Powers was convened at Lausanne, Switzerland on Nov. 20, 1922 and was in session for eleven weeks, when it broke down, on Feb. 4, 1923, owing to the peremptory refusal of the Turkish delegation to accept a treaty drafted by the allied leaders. All hopes of destroying Turkish power by fostering Greek imperialism in Asia Minor had been dissipated, but Great Britain was determined to maintain control of Mesopotamia (particularly Mosul) and to secure continued neutralization of the Straits. The French supporting the Turks on these territorial questions, nevertheless aroused their suspicion and opposition by insisting on the maintenance of the Capitulations and the confirmation of all Allied concessions in Turkey. French prestige received a substantial setback with the granting (April 10) to American interests of the Chester concessions which authorized railroad construction and industrial developments throughout Eastern Asia Minor. The breach between France and Turkey grew wider with the lapse of time and when at Turkish suggestion and with Allied acquiescence the Conference of Lausanne was resumed on April 22, the French steadily lost ground, but, their power being almost wholly absorbed in the contemporaneous occupation of the Ruhr, they were unable to coerce the Turks into any measurable recognition of their claims. On May 15, it was disclosed that a syndicate of British interests had purchased a controlling interest in the Bagdad Railway.

The Lausanne Treaty. On July 24, 1923, the treaty was finally signed at Lausanne by representatives of Great Britain, France, Italy, Japan, Greece, Rumania and Turkey which constituted a drastic revision of the whole Near Eastern Settlement as registered in the Treaty of Sèvres. Jugo-Slavia alone refused to sign because of dissatisfaction with the Ottoman debt settlement Turkey definitely resigned all claims to Hedjaz, Palestine, Transjordania, Mesopotamia and Syria, but she retained all of Anatolia, Turkish Armenia, Cilicia, Adalia, Smyrna, Constantinople, Gallipoli, Adrianople and Eastern Thrace to the Maritza River. Along the new European frontier a neutral or demilitarized zone 60 kilometers wide was created, to prevent border conflicts. Likewise, but for a different purpose, the Gallipoli peninsula and the shores of the Straits were demilitarized and the Straits themselves were placed under an international commission supervised by the League of Nations. The "freedom of the Straits," for which the British foreign minister, Lord Curzon, had so valorously battled, was assured by a separate convention, bearing all the earmarks of compromise, by which merchant and war vessels, the latter in restricted number, were permitted liberty of passage in peace and war, except in case Turkey should be one of the belligerent powers. Disposition of the coveted oil fields of Mosul, in dispute between Britain and Turkey, was to be decided by diplomatic agreement, or, that failing, by reference to the League. Not only were the fettering restrictions which the Allies had attempted to place on Turkish finance, army, and navy, struck off, but reparation claims were canceled and the Allies recognized the abolition of the Capitulations, stipulating merely that Turkey should appoint for a transitional period of five years four legal councilors, from neutral states, to observe the working of the Turkish courts. The Nationalists, in short, won a remarkable diplomatic victory in their single-handed diplomatic combat with the powers of Europe. The erstwhile aggressive Greeks were thoroughly humiliated. Not only were they compelled to surrender Smyrna, Gallipoli, and Eastern Thrace to Turkey, but also to resign again to Italy the Greek-speaking Dodecanese islands in the Ægean. Some 600,000 Greek nationals were to be deported from Turkish territory in exchange for Turkish nationals.

As the United States had not participated in the Lausanne Conferences except through an "observer" (Mr. Grew), it was necessary to negotiate a separate treaty between Turkey and the United States, recording the consent of the latter to the abrogation of the Capitulations and other changes made by the treaty above described. Accordingly, on August 2 Turkish and American delegates at Lausanne signed a treaty of commerce and amity. Ratification by the Senate being delayed, this treaty was subjected to the buffets of political controversy in the United States, and its ultimate acceptance was far from certain in August, 1924.

ENFORCEMENT OF THE VERSAILLES TREATY

Some portions of the Treaty of Versailles such as the guarantees of its execution prescribed in Part 14 were merely recognitions of *faits accomplis*, and others were speedily put into operation. The League of Nations and the International Labor Organization authorized by Parts 1 and 13 respectively were early established—the first International Labor Conference being held in 1919 and the first session of the League of Nations being convened in 1920 Part 7 relating to penalties proved practically impossible of execution. On the ground that no existing International Court possessed legal jurisdiction, the Dutch government refused to comply with reiterated allied demands for the extradition and trial of the former German Emperor, and in March, 1920, the "solemn farce" was terminated by an understanding that William II would be indefinitely interned in Holland and prevented from participating in any further international mischief. A similar demand made upon Germany in February, 1920, for the extradition of some 882 war criminals, including civilians and military and naval officers of high rank, was finally abandoned in favor of a German proposal that the accused be tried by a German Federal Court at Leipzig. The Inter-allied Justice Commission promptly transmitted to Berlin the names of some 46 offenders against whom

the evidence was most conclusive, the Allies reserving the right to hold retrials should they consider the verdicts palpably unjust. The Germans were very dilatory about proceeding to try these men and though the matter was discussed at the Spa Conference (July 5–16, 1920) it was not until after the Allied ultimatum of Apr. 30, 1921, demanding action on this point among others, that trials began at Leipzig. A few convictions resulted but the whole proceeding was rather farcical.

Territorial cessions and boundary readjustments prescribed under Parts 2, 3, and 4 were effected as far as Germany was concerned without great difficulty except in the case of Upper Silesia. The economic sections of the treaty relating to Ports, Waterways and Railroads, etc., occasioned some difficulty, but the really great conflicts took place over German disarmament, involving the all-important issue of French security, and over reparations involving a whole complex of issues such as time and methods of payment, inter-allied allocation of the proceeds, inter-allied cancellation of debts, the restoration of northern France, Belgium etc., the economic rehabilitation of Europe, French security, extension of Allied occupation of German territories (e.g. seizure of the Ruhr), and the maintenance or disruption of Allied solidarity. (See REPARATIONS.)

The treaties of 1919–1920 as we have seen, provided for the unilateral application of the principle of disarmament with the avowed purpose of attaining that long sought objective—the destruction of German militarism. Throughout 1920, the Allies had to insist on reduction of the German army to the 100,000 limit imposed by the treaty. At the Spa conference (April 18–25) Premier Millerand, yielding to an Italian demand for trade negotiations with Russia, and to Lloyd George's Near Eastern importunities, secured as the price of his consent on these two points, a joint demand upon Germany for immediate disarmament, a refusal of a German request for a permanent army of 200,000 men, and a severe warning against future infractions of the Treaty. At the Spa Conference (July 5–16) German disarmament was the first question considered. After a heated discussion Germany in return for her promise to disband immediately certain auxiliary forces such as the *Sicherheitspolizei* and *Einwohnerwehr*, was finally granted (July 9) permission to postpone until Jan. 1, 1921 the reduction of her army to the prescribed limit, though it was stipulated that it should not exceed 150,000 effectives after Oct. 1, 1920. As a guarantee of her faithful execution of these requirements, the Allies reserved the right to invade and occupy the Ruhr Valley or other regions. After the Spa Conference the question of German disarmament continued to be the subject of numerous notes exchanged between the Entente Powers and the German government. The Germans, however, failed to live up to their promises, and disarmament along with reparations again came to the fore at the Paris Conference Jan. 24–29, 1921, at which time they were given until July 1 to comply with the Spa agreement. Persistent dilatoriness on this point together with non-payment of reparations and postponement of war-criminals trials, led to the issuance of an ultimatum (May 7, 1921) by the London Conference threatening invasion of the Ruhr should not the Germans without reservations comply with treaty requirements by May 12. On May 10 the Reichstag voted to submit. Thereafter better progress was made. The work of disarmament continued under the supervision of the inter-allied military control commission. French security constituted an important subject of discussion at the Cannes Conference January, 1922. As the best method of adequately protecting France against attack and of fostering peace in Europe, Lloyd George, voicing English opinion, advocated a tripartite agreement embracing England, France, and Germany. Premier Briand vehemently opposed this plan and demanded an Anglo-French military alliance. After considerable parley, a 10-year treaty was signed (but never ratified) by which both powers reaffirmed their common interest in those provisions of the Versailles Treaty relative to German fortifications and military activities along the Rhine; both powers undertook also to act in concert should Germany take any measures incompatible with the Treaty, and Great Britain specifically promised to place her naval, military, and aërial forces at the disposal of France in the event of direct and unprovoked aggression by Germany. Bitter opposition in the French Chamber of Deputies to Premier Briand's promises to moderate his attitude toward Germany led to his supersession by the nationalistic Poincaré. This change in the French government put an end temporarily to the chance of recementing Entente solidarity and foreshadowed the military occupation of the Ruhr. At the Genoa Conference (Apr. 10–May 15, 1922) Lloyd George proposed a 10-year European non-aggression compact, but the French refused to accept this plan unless every other European nation agreed to sign, unless Russia recognized all her existing boundaries during the 10-year period and unless France forfeited none of her rights for enforcement of the Versailles Treaty. During 1920–1921, France and Great Britain had drifted apart due to divergence of interests and policies, as regards German reparations, Poland and relations with Russia, and Turkey and the Near Eastern settlement. On January, 1923, the Franco-Belgian seizure of the Ruhr further undermined their relations, and by 1924 the *entente cordiale* of 1904 had been definitely transformed into suspicion and dislike, exacerbated not only by the above-mentioned differences on questions of policy but also by a keen rivalry in aëronautical expansion. France, meanwhile, in an endeavor to stabilize the treaties of which she had been the most active and powerful defender, had forged a network of alliances with other European states. In July, 1920, a defensive alliance was concluded with Belgium; in February, 1921, with Poland; and in 1924 with Czecho-Slovakia and Rumania. France therefore, became by the spring of 1924, the leading spirit in a system of European alliances maintaining standing armies aggregating nearly 2,000,000 men, and consecrated to the preservation of the newly made peace treaties by force if necessary. However, with the advent to power of the Labor ministry in Great Britain (January, 1924) and the replacement in France of the Nationalistic government of Poincaré by a Radical-Socialist ministry under Herriot (June, 1924), the prospects of a European settlement perceptibly brightened. The avowed intentions of

Premiers Macdonald and Herriot to pursue more pacific policies and to utilize the League of Nations as a universal guarantee of national security and an instrument of international cooperation, the favorable reception of the Dawes Report, the evidence of a new coöperative spirit in Germany regarding reparations and disarmament, the more widespread resumption of amicable relations with Russia, and the favorable outcome of the London Conference of July–August, 1924, all seemed to presage a new era in the liquidation of post-war problems of reconstruction and readjustment. Other phases of international post-war problems are discussed under the following heads: LEAGUE OF NATIONS; LABOR ORGANIZATION, INTERNATIONAL; MANDATES; REPARATIONS; WASHINGTON CONFERENCE; RACIAL MINORITIES TREATIES. For national points of view, see the history sections under the articles UNITED STATES; GREAT BRITAIN; FRANCE; GERMANY; RUSSIA; TURKEY; AUSTRIA; HUNGARY; etc Detailed treatment of the territorial and political disputes that arose out of the making of the Peace and its application will be found under the following: TIROL, GERMAN SOUTH; BURGENLAND; FIUME-ADRIATIC CONTROVERSY; KLAGENFURT; THRACE; BANAT; TRANSYLVANIA; BESSARABIA; BUKOVINA; SILESIA, UPPER; TESCHEN, ZIPS, AND ORAVA; DANZIG; ALLENSTEIN–MARIENWERDER; GALICIA; VILNA; MEMEL; LITTLE ENTENTE; SAAR BASIN; EUPEN, MALMÉDY, AND MORESNET; LIMBURG, SOUTHERN; LUXEMBURG; SCHLESWIG; RHINELAND; DODECANESE; SMYRNA; CILICIA; DARDANELLES AND BOSPORUS STRAITS; KURDISTAN; SHANTUNG. See the articles EUROPE and AFRICA for a general presentation of the territorial readjustments effected by the War in these two continents.

For preliminary discussions of peace, see WAR, DIPLOMACY OF THE.

PEACH BORER. See ENTOMOLOGY, ECONOMIC.

PEAR THRIPS. See ENTOMOLOGY, ECONOMIC.

PEARL, RAYMOND (1879–). An American biologist and statistician, born in Farmington, N. H., and educated at Dartmouth and the the University of Michigan He taught at the latter and the University of Pennsylvania until 1907, when he received the appointment of biologist and head of the department of the Maine Agricultural Experiment Station. He resigned this position in 1918 to become professor of biometry and vital statistics at the Johns Hopkins University School of Hygiene and Public Health. He was also made official statistician of the university and consultant in vital statistics and epidemiology to the United States Public Health Service. His published works comprise: *Modes of Research in Genetics* (1915); *The Nation's Food* (1920); *The Biology of Death* (1922); *Introduction to Medical Biometry and Statistics* (1923). In collaboration with Mitchell he wrote the *Reference Handbook of Food Statistics.*

PEARSE, ARTHUR SPERRY (1877–). An American zoölogist, born at Crete, Neb., and educated at the University of Nebraska and Harvard. He was Austin teaching fellow at Harvard (1907–08); instructor in zoölogy (1909–10) and assistant professor (1910–11) at the University of Michigan; assistant professor of zoölogy at the University of the Philippines for three months in 1911; and associate professor (1912–19) and professor of zoölogy (1919–) at the University of Wisconsin. Professor Pearse published articles on animal behavior, fishes, and crustacea, as well as *General Zoölogy* (1917).

PEGRAM, GEORGE BRAXTON (1876–). An American physicist, born at Trinity, N. C., and educated at Trinity College, Durham, N. C., at Columbia University, and at Berlin and Cambridge. In 1900 he became assistant in physics at Columbia, where in 1916 he became full professor and in 1917 dean of the faculty of applied science. He was a magnetic observer with the United States Coast and Geodetic Survey (1902–06). Dr. Pegram made original studies on the electromagnetic theory and on radioactivity.

PEIXOTTO, ERNEST CLIFFORD (1869–). An American artist, born in San Francisco. He studied in Paris as a pupil of Benjamin Constant and Jules Lefebvre at the Académie Julien. He spent much of his time in Europe writing and illustrating for American periodicals and during the War directed the American Expeditionary Forces art training centre at Bellevue, France. He was elected Associate of the National Academy in 1919 and Chevalier of the Legion of Honor in 1921. Besides having exhibited many pictures at the Paris Salon and in leading American galleries, he produced many books on travel in Europe and America. He executed mural friezes and was director of mural painting at the Beaux-Arts Institute of Design, New York, after 1919. His later books include: *By Italian Seas; Through the French Provinces; Romantic California; Pacific Shores from Panama; Our Hispanic Southwest; A Revolutionary Pilgrimage,* and *The American Front.*

PELLAGRA. The nature of this strange malady was not cleared up in the interval between 1914 and 1924; if anything, less was known about it in 1924 than ever. In the south of Europe, pellagra was known continuously for centuries and seemed to be nothing more than a form of poisoning by spoiled maize. Study in the United States showed many facets of the disease, and now it is known that many who have been committed to insane asylums in the northern States, Canada, Great Britain, and other cool countries in which pellagra has never been recognized, have in reality been sufferers from this same affection. Cases were reported in England, where maize is not eaten, and once attention had been focused on the possibility of further cases, numbers were recognized among the insane population, and the supposition that this is nothing new asserted itself. The theory of spoiled maize which was reasserted in connection with new cases of the disease in Rumania gave way to another, after the discovery of vitamine, to the effect that pellagra is not a form of food intoxication but is due to the absence of some vitamine-like principle in the food. This view was soon shown to be fallacious, but it was found that the disease could at times be prevented by a well-balanced, nutritious diet, while pellagrins also improved and even appeared to recover on such a diet. The theory of a deficient diet was partly exploded by the discovery that in California and Louisiana prosperous and well-nourished people were developing the disease. Despite all negative evidence, it cannot be denied that in one locality spoiled maize and in another a merely defective diet has precipitated the dis-

ease, and that when the cause was withdrawn the disease receded. In 1924 it seemed that several quite dissimilar factors could either predispose to or excite the disease and that the essential causal factor was as yet unknown.

PELLE, M. C. J. (1869–1924). A French soldier and diplomat, born in 1869. During the War he was chief of staff to Marshal Joffre and in 1920 was appointed High Commissioner to Constantinople. He endeavored to bring about a cessation of hostilities between the Turks and the Greeks and to promote harmony between the Turks and the Allies. He was one of the signers of the Treaty of Lausanne Later he was sent to Czecho-Slovakia as chief of the French mission, and on Mar. 15, 1924, the French government conferred on him the Grand Cross of the Legion of Honor in appreciation of his services.

PELLIOT, PAUL (1878–). A French archæologist and Orientalist, born in Paris. In 1899 he was made a member of the Archæological Mission to French Indo-China, subsequently the French School of the Far East. In 1905 he was named by the Minister of Education to head an archæological expedition to Central Asia and China, to investigate traces of pre-Islamic Buddhism in China. At Tunchuk, in the Chinese Turkestan, Pelliot discovered the ruins of a Buddhist temple built in the Græco-Buddhist style, and from there he was directed to a monastery at Tuen Huang, where he made an amazing find of some 15,000 manuscripts and silk paintings. He brought back most of the manuscripts as well as other objects of historical value to Paris. The collection of Chinese manuscripts which he organized at the Bibliothèque Nationale was larger than any to be found in China proper. The manuscripts, which all date before the eleventh century, are in Chinese, Tibetan, and Sanskrit The French government rewarded Pelliot for his expedition by creating for him at the Collège de France a chair on the languages, history, and archæology of Central Asia. In 1921 he was elected to the Academy of Inscriptions. A catalogue and description of the findings of his expedition was published under the title *La Mission Pelliot en Asie Centrale,* 5 vols. (1914–21).

PENANG. See STRAITS SETTLEMENTS.

PENNELL, JOSEPH (1860–1926). An American etcher, illustrator, and author (see VOL. XVIII). His later publications include *Pictures of War Work in America* (1918) and *Etchers and Etching* (1919). With his wife he edited *The Whistler Journal* (1921). He was chairman of the jury of the International Exhibition at Leipzig in 1914 and also at the Panama-Pacific Exposition in 1915, where he was awarded a commemorative medal. He won the Grand Prix in Florence in 1915 and was elected to the American Academy of Arts and Letters in 1922. In recent years he has conducted a wide and influential propaganda for better education in the graphic arts in the United States.

PENNINGTON, MARY ENGLE (1872–). An American chemist, born at Nashville, Tenn., and educated at the University of Pennsylvania, where she was a fellow in botany. During 1897–98 she was a fellow in physiological chemistry at Yale. In 1898 she became director of the chemical laboratory of the Women's Medical College of Pennsylvania, meanwhile serving as chief of the Philadelphia Chemical Laboratory. These positions she resigned in order to accept the office of chief of the food research laboratory of the Bureau of Chemistry in Washington (1908), which she held until 1919, when she became manager of the research and development division of the American Balsa Company of New York. Her original investigations pertained to the chemical, bacteriological, and histological study of flesh foods, as well as of milk, on which she published her results in the publications of the American Chemical Society, the Society of Biological Chemists, and other scientific organizations.

PENNSYLVANIA. Pennsylvania is the thirty-second State in size (45,126 square miles) and the second in population; capital, Harrisburg. The population increased from 7,665,111 in 1910 to 8,720,017 in 1920, a gain of 13.8 per cent. The white population increased from 7,467,713 to 8,432,726; negro, from 193,919 to 284,568; native white, from 6,028,994 to 7,044,876. The foreign-born white population decreased from 1,438,719 to 1,387,850. Both urban and rural populations increased in the decade, the former from 4,630,669 to 5,607,815; the latter from 3,034,442 to 3,112,202 The growth of the principal cities was as follows: Philadelphia, from 1,549,008 in 1910 to 1,823,779 in 1920; Pittsburgh, 533,905 to 588,343; Scranton, 129,867 to 137,783; Reading, 96,071 to 107,784; Erie, 66,525 to 93,372. See articles on these cities.

Agriculture. Pennsylvania is one of the greatest of the eastern agricultural States, but in common with nearly all of them it showed a general decline in agriculture during the decade 1910–20. While the population of the State increased 13.8 per cent in that decade, the rural population decreased from 45.3 per cent in 1900 and 39.6 per cent in 1910, to 35.7 per cent in 1920 The total acreage in farms in 1910, 18,586,832, fell off to 17,657,513 in 1920, or 5 per cent. The number of farms decreased from 219,295 to 202,250 or 7.8 per cent, the improved land in farms, from 12,673,519 acres to 11,847,719, or 6.5 per cent. The percentage of total land area used for agricultural purposes decreased from 64.8 in 1910 to 61.5 in 1920; the percentage of land improved, from 68.2 to 67.1. The total value of all farm property showed an apparent increase, from $1,253,274,862 to $1,729,353,034, or 38 per cent, the average value per farm, from $5715, to $8551. In interpreting these values, however, and, indeed, all comparative values in the decade 1914–24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 202,250 farms in 1920, 153,498 were operated by owners, 4490 by managers, and 44,262 by tenants. The comparative figures for 1910 were 164,229, 3961, and 51,105. White farmers in 1920 numbered 201,799, of whom 187,277 were native and 14,522 foreign-born. The negro farmers numbered 451. Farms free from mortgage in 1920 numbered 93,804, compared with 112,156 in 1910. Those under mortgage numbered 48,498, compared with 50,699 in 1910. The total number of dairy cows in 1920 was 1,049,763; 933,640 in 1910. "Beef cows" numbered 57,440, compared with 99,220 in 1910; and sheep declined in number from 637,541 to 508,711. There were 977,637 hogs in 1910, and

1,190,951 in 1920 The estimated production of the principal farm crops in 1923 was as follows: corn, 62,062,000 bushels; spring wheat, 221,000; winter wheat, 24,168,000; oats, 31,-996,000; rye, 3,655,000; barley, 282,000; potatoes, 20,539,000; sweet potatoes, 235,000; tobacco, 57,408,000 pounds; buckwheat, 4,434,000 bushels; and hay, 3,019,000 tons. Comparative figures for 1913 are: corn, 57,057,000 bushels; wheat, 21,862,000; oats, 35,774,000; rye, 4,900,-000; barley, 182,000; potatoes, 23,320,000; hay, 4,146,000 tons; and tobacco, 46,680,000 pounds. The apple crop in 1909 amounted to 11,048,430 bushels; in 1919, to 5,512,795. The production figures for peaches in those years were 1,023,570 and 1,099,737 bushels, respectively.

Mining. Pennsylvania, in point of value of products, is most important of the mineral-producing States. In the order of their importance, these products are coal, cement, natural gas, and clay products. Petroleum, of which the State was the original and for many years the chief producer, lost importance through the gradual exhaustion of the wells and the discovery of large areas of petroleum land in other States. Pennsylvania is the only State which produces both anthracite and bituminous coal. All the anthracite coal produced is obtained from the Pennsylvania fields. The progress of the coal mining industry during the decade 1914-24 is indicated by the following production figures: 1914, bituminous, 147,983,294 net tons valued at $159,006,296; anthracite, 90,821,-507 net tons valued at $188,181,399. 1915, bituminous, 157,955,137, $167,419,705; anthracite, 88,995,061, $184,653,498. 1916, bituminous, 170,-295,424, $221,685,175; anthracite, 87,578,493, $202,009,561. 1917, bituminous, 172,448,142, $421,268,808; anthracite, 99,611,811, $283,650,-723. 1918, bituminous, 178,550,741, $463,159,-736; anthracite, 98,826,084, $336,480,347. 1920, bituminous, 170,607,847, $642,630,000; anthracite, 89,598,249, $434,252,198. 1921, bituminous, 116,013,942, $322,538,300; anthracite, 90,473,-451, $452,304,903. In 1922 the bituminous production was 113,148,308 net tons; the anthracite, 54,683,022. The greatly increased value of coal in the later years of the decade was due partly to conditions arising from the coal miners' strikes and partly to the inflation of the currency. In shipments of Portland cement Pennsylvania ranks first among the States, with 25,985,106 barrels, valued at $20,944,787, in 1914; 28,748,546 barrels, $27,915,298, in 1916; 22,238,689 barrels, $33,600,956, in 1918; 27,662,116 barrels, $52,632,082, in 1920; and in 1922, 34,023,695 barrels. The production of petroleum during this period averaged about 8,000,000 barrels per year: In 1914 it was 8,-170,335 barrels; 1916, 7,592,394; 1918, 7,407,-812; 1920, 7,438,000; 1922, 7,425,000. In addition to the minerals noted above, the State produces large quantities of clay products, natural gas and natural gas gasoline, sand and gravel, and stone. The total value of the mineral products in 1921 was $944,688,650, compared with $1,314,332,585 in 1920; $918,048,917 in 1919; $979,245,098 in 1918, and $452,824,034 in 1914.

Manufactures. Pennsylvania, ranking second among the States in industrial importance, was surpassed only by New York. There were, in 1920, 77 cities having more than 10,000 inhabitants, which formed 50.8 per cent of the total population of the State and which reported, in 1919, 63.7 per cent of the State's manufactured products. There were in the State, in 1909, 27,563 manufacturing establishments; in 1914, 27,521; and in 1919, 27,973. Persons engaged in manufacture numbered 1,002,171, 1,060,562, and 1,323,662; and the capital invested amounted to $2,749,005,975, $3,149,411,089, and $6,177,-729,968, in those years. The value of products in 1909 was $2,620,742,034; in 1914, $2,832,-349,437; and in 1919, $7,315,702,867. The large increase in the value of products in 1914–19. was, however, due largely to changes in industrial conditions brought about by the War and cannot properly be used to measure the growth of manufactures during the period; but the increase in number of wage earners clearly indicates a decided growth in the manufacturing activities of the State. Steel works and rolling mills, chief in point of value of product, had an output valued, in 1909, at $500,344,000; 1914, $448,106,000; 1919, $1,296,412,000 Foundry and machine shop products rank second in this respect, amounting in 1909 to $210,746,-000; 1914, $233,616,000; and 1919, $624,415,-000. Iron and steel blast furnace production is third in value of output: in 1909, $168,578,-000; in 1914, $135,806,000; in 1919, $311,080,-000. Ship and boat building, in fourth place, in 1909 amounted to $6,178,000; 1914, $9,540,-000; and in 1919, $237,325,000. The extraordinary increase in the value of the shipbuilding industry from 1914 to 1919 was due, of course, to the unusual demand for ships during the War, and cannot be taken as an index of the normal increase of the industry. The most important manufacturing cities of the State are Philadelphia, Pittsburgh, and Reading. There were (1909), in Philadelphia, 8375 manufacturing establishments, with a product valued at $743,720,000; in 1914, 8545, with $784,500,000; and in 1919, 9064, with $1,996,481. In Pittsburgh, in 1909, there were 1658 with $243,392,-000; in 1914, 1741 with $246,694,000; and in 1919, 1875 with $614,727,000. Similar figures for Reading are: in 1909, 482, with $51,135,000; in 1914, 486 with $53,232,000; and in 1919, 527 with $141,561,000. Other manufacturing cities are Allentown, Altoona, Bethlehem, Erie, Scranton, and Wilkes-Barre.

Education. While Pennsylvania has always been aggressive in the education of its citizens, in many respects the laws under which its system was administered both previous to and during the decade 1913–23 were unsatisfactory. To remedy this condition the Legislature of 1921 passed a number of laws. These provided for the raising of the standard qualifications of teachers; established a higher schedule of salaries; added to the support of the normal schools, increasing their facilities and improving their work; increased the length of the school term, especially in fourth-class districts; reënforced compulsory school attendance; established State aid to local communities for the maintenance of new and higher standards; established a budget system in every school district; encouraged the consolidation of rural schools; and centralized and unified the State school administration by abolishing the State Board of Education and the college and university council and creating in their place the State Council of Education. These new measures were proving most beneficial in their results. One of the best evidences of the results was the remarkable response of the teachers to

the new demands for improved qualifications; for nine weeks during the summer vacation in 1922, more than 25,000 school teachers attended summer school, taxing the colleges and normal schools of the State to their utmost capacity. The total number of pupils in the State in 1913–14 was 1,401,325. This had increased in 1920–21 to 1,709,077 The enrollment in kindergarten and elementary schools in the latter year was 1,514,825, in the high schools, 194,852. The total expenditures for education increased from $52,544,036 in 1913–14 to $129,344,699 in 1921–22. The percentage of illiteracy in the State decreased from 7.3 in 1910 to 6 in 1920; among the native white population, from 1.8 to 1; among the foreign-born white, from 20.8 to 20.1; and among the negro population from 11 to 7 3

Finance. For finance, see article on STATE FINANCES.

Political and Other Events. Pennsylvania remained strongly Republican as heretofore in the decade 1914–24 In 1914 elections were held for United States Senator and for Governor and other state offices. Martin G. Brumbaugh, Republican, was elected governor, against Vance G. McCormick, Democrat. The Republican candidate for reëlection to the Senate was Boies Penrose. He was opposed by A. Mitchell Palmer, Democrat, and Gifford Pinchot, Washington party Senator Penrose received 519,801 votes; Pinchot, 269,265; and Palmer, 266,415. In 1916 Philander C. Knox, Republican, was elected to the United States Senate. In the presidential election that year Charles E. Hughes received 703,823 votes; Woodrow Wilson, 521,784. The 1917 municipal primary elections in Philadelphia and Pittsburgh were marked by more than ordinary factional bitterness which had not been entirely eliminated up to 1924. There was serious trouble in Philadelphia, where a number of officials were accused of having brought gunmen from New York into one ward to influence the election. In 1918 William Cameron Sproul, Republican, was elected governor, together with the entire State ticket of that party. At the same election the people approved a constitutional amendment providing a $50,000,000 bond issue for highways In 1920 Boies Penrose was reëlected to the Senate, with 1,067,989 votes. John A. Farrell, Democrat, received 484,362 votes, while 132,610 were cast for Leah Cobb Marion, Prohibitionist, the first woman in a Pennsylvania State-wide political contest. In the presidential voting Warren G. Harding received 1,218,216 votes; James M. Cox, 503,843 President Harding appointed two Pennsylvania Republicans to cabinet positions. They were Andrew W. Mellon, Secretary of the Treasury, and James J. Davis, Secretary of Labor. In 1921 the people rejected a proposal to hold a constitutional convention. Senator Knox died suddenly in October, 1921, and William E. Crow of Uniontown was named by Governor Sproul to succeed him. Senator Penrose, the recognized leader of the State Republican organization, died on New Year's Eve of the same year. George Wharton Pepper of Philadelphia was appointed to his place In August, 1922 Senator Crow died. He was succeeded by David Aiken Reed of Pittsburgh. The Republican primary election in May, 1922, was marked by a bitter contest for the gubernatorial nomination between Gifford Pinchot, supported by the Progressive element, and Attorney General George E. Alter, whose chief support came from the Philadelphia and Pittsburgh organizations. Pinchot's majority was 9259 votes, and he was elected Governor in November over John A. McSparran, Democrat, head of the State Grange. Senators Pepper and Reed were elected at the same time. In 1923 Governor Pinchot was largely instrumental in averting the threatened anthracite coal miners' strike. In the spring election of 1924 the people approved another constitutional amendment providing an additional $50,000,000 bond issue for roads The most interesting event of that election was the defeat of Governor Pinchot for delegate-at-large to the Republican national convention by an eleventh-hour attack on the part of disgruntled political leaders and liquor interests led by Representative William S Vare of Philadelphia. In June, 1924, W. Harry Baker was reëlected chairman of the Republican State Committee without opposition, while Joseph F. Guffey, after a bitter fight, seized control of the Democratic organization in spite of opposition from the faction headed by Judge Eugene C. Bonniwell and Judge Samuel E Shull and from the wing led by Vance McCormick and Bruce F. Sterling. John Bigelow, a Guffey adherent, was elected Democratic chairman. Before the general election of 1924 the political complexion of Pennsylvania's congressional delegation was: Senate—Republican, 2; House—Republican, 30; Democratic, 6.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. The Legislature of 1915 approved a resolution for a State constitutional amendment providing for woman suffrage; this was voted down by the people by a 55,686 majority. In 1917 a direct inheritance tax law was passed. As a war measure a State council of defense was created and $5,000,000 provided for it. The 1919 Legislature ratified the woman suffrage amendment to the national Constitution on January 24 and the prohibition amendment on February 25. In 1921 bitter opposition developed to a legislative programme proposed by Governor Sproul On April 25 his supporters held a rump session, ousted the Speaker, elected another in his place, and passed all administration measures. These included taxes on anthracite coal and gasoline, a measure repealing non-partisan election laws in Pittsburgh and Scranton, and a bill creating a State department of public welfare. The 1923 Legislature, with eight women members, repealed the high license law for saloons and adopted one more in harmony with the Volstead Act. It passed a modified old-age pension bill, approved a measure providing for a constitutional convention in 1926, subject to the approval of the voters, and favored a constitutional amendment providing a $35,000,000 bond issue for a soldiers' bonus, which had been approved by the 1921 Legislature also. The gasoline tax was increased and a small tax placed on profits, but proposals to tax bituminous coal and the capital stock of manufacturing corporations and to repeal the anthracite coal tax were defeated. An extensive reorganization of the State government, proposed by Governor Pinchot, was adopted. A series of 12 election reform bills was defeated In 1924 the State Supreme Court ruled that owing to technical defects the proposed soldiers' bonus amendment could not be

submitted to the people. In July, 1924, the Dauphin County court held the old-age pension bill unconstitutional. Constant legislative efforts to improve the educational facilities of the State resulted in an elaborate educational system for which the 1923 Legislature appropriated $46,401,881 to be administered by the Department of Public Instruction.

PENNSYLVANIA, UNIVERSITY OF Located in Philadelphia, Pa.; founded in 1740 and developed by Benjamin Franklin. During the 10-year period from 1914 to 1924 the university developed in every line. The student enrollment increased from 2245 in 1914 to 8302 in the regular courses, and 7438 in the extension courses in 1923–24. The faculty increased from 241 to 1100 members including administrative officers and research workers The library increased from 75,000 to 548,387 volumes The development of the university during this period was shown by the establishment of the following separate schools, each with its own dean or director: (1) the School of Education, established in 1914; (2) the Graduate School of Medicine, said to be the only one of its kind in existence, formed in 1919 by a merger with the university of the Medico-Chirurgical College and Hospital and the Philadelphia Polyclinic Hospital and College for Graduates in Medicine, (3) the School of Hygiene and Public Health, developed in 1920 from the former Laboratory of Hygiene; (4) the School of Fine Arts, formed in 1920 by a merger of the former separate departments of music and architecture; (5) the Moore School of Electrical Engineering, established in 1923 by a merger of the courses at the university in electrical engineering with the School of Electrical Engineering provided for in the will of the late Alfred Fitler Moore. The new school had an endowment of approximately $1,600,000. Other developments were the establishment of a course in military science and tactics in 1917 and the construction in 1922, at a cost of $825,000, of the new stadium on Franklin Field, which had a seating capacity of 55,000.

A number of important gifts were received by the university during this period. Among them was a gift of $400,000 from the estate of Dr J. William White to establish the White professorship of surgical research; a gift of $500,000 from Helen T Massey to increase the salaries of faculty members in the College; a gift of $549,736 from the estate of William B. Irvine to construct an auditorium; and a gift of $113,518 from the estate of Abraham S. Wolf through the generosity of Miriam H. Wolf for a ward in the University Hospital. New buildings erected included the J. William White Surgical Pavilion; a maternity building for the University Hospital, and a new wing for the University Museum.

The dismissal of Prof. Scott Nearing in 1915, on the ground that he made speeches of a radical nature which injured his usefulness as a member of the faculty, attracted wide attention, and much was published in defense and criticism of the action. Fifteen hundred of the students signed a petition asking the Board of Trustees to recall Dr. Nearing, but they declined to reconsider their decision.

During the War the university conducted its regular courses in military science and tactics and maintained training units for the United States Army and Navy. It also organized a base hospital in France, seven Red Cross units, and three ambulance units.

Edgar Fahs Smith, Ph.D., Chem.D., Sc.D., Litt.D., L.H.D., LL.D., resigned as provost in 1920 and was succeeded by Josiah H. Penniman, Ph.D., LL.D, as acting provost. Dr. Penniman was elected provost in January, 1923, and president of the university in October, 1923.

PENNSYLVANIA STATE COLLEGE. A nonsectarian, coeducational institution at State College, Centre County, Pa., founded in 1859. The student enrollment of the college increased from 2245 in 1914 to 3300 undergraduates and professional students and 150 graduate students in the year 1923–24, with more than 2000 in the summer session of 1923, the faculty increased from 241 to 631 members, with 320 resident members, 31 research workers, and 280 extension workers; the library increased from 75,000 to 81,000 volumes A group of four large engineering buildings was completed in the decade in addition to a mechanical engineering building finished in 1920. A new residence hall for men and a new beef cattle barn were completed in 1923, and an 18-hole golf course was laid out. Farm land holdings were increased to 2000 acres and the campus proper to 200 acres. A Graduate School was authorized in 1922, and a School of Education was created in 1923. John Martin Thomas, D.D., LL.D., formerly president of Middlebury College, Vt., in 1921 succeeded Edwin Erle Sparks, LL.D., as president.

PENNSYLVANIA UNIVERSITY MUSEUM. See EXPLORATION.

PENOLOGY. The outstanding event in penology within the decade 1914–24 was the extension of the plan of inmate self-government to prisons for male adults. This plan was not of sentimental origin, as some critics have charged, but was based on the therapeutic principle that to reform law-breakers it is wise to hold them during confinement in a social *milieu* similar to that into which they will later be discharged, and further to give them an opportunity to use, under such limits as restraint imposes, those faculties or qualities of self-reliance, initiative, judgment, and responsibility which normal life requires. As such, it is opposed to the traditional system of autocratic discipline or rule in prisons, by which substantially every movement of the prisoner's day is fixed for him. Self-government had been a feature of the George Junior Republic, founded by William R George at Freeville, N. Y., in 1895, and in 1912 Calvin Derrick had adapted the plan to the State reformatory at Ione, Cal. The first extension of the idea to adult male prisoners was made at the New York State prison at Auburn, N. Y., in 1914 under the unofficial inspiration and guidance of Thomas Mott Osborne, who later in the same year became warden of Sing Sing, another prison for confirmed male offenders in the same State, and incorporated the plan there. In both instances the self-governing body was named the Mutual Welfare League. Each incoming prisoner became a participant in the self-governing activities and could be expelled by the members. The activities consisted of advising and to a large extent conducting the routine affairs of the prison; this was done both through elected officials from the mass of prisoners and through committees. The prisoners handled much of

the discipline of the prison also and punished their own members through inmate courts. Later, Osborne put the plan into effect at the United States Naval Prison at Portsmouth, N. H., where he was commandant for two years. At none of these three places did it remain in effect in 1924, except in a somewhat emasculated form at Sing Sing. The State reformatories at Rahway, N. J., and Cheshire, Conn., adopted the plan for a time but abandoned it It is now in effect at the Westchester County Penitentiary at White Plains, N. Y., and at the New Jersey State Reformatory for Women at Clinton, N. J. A beginning toward its adoption was made at the Detroit House of Correction. At a number of other penal institutions there were modifications in the traditional autocratic régime in response to the educational effect of the self-government idea

Unquestionably the decade saw a rapidly growing interest in the law-breaker and a more scientific approach to the difficulties of his treatment. This was evidenced by a number of careful studies of State and municipal penal systems in the United States In 1916 the New Jersey Prison Inquiry Commission made a searching study of all correctional and penal institutions in that State. A similar study was made in Pennsylvania in 1917–18 The National Committee on Prisons and Prison Labor made a study of the District of Columbia's penal institutions, and the Prison Survey Committee of New York State published the results of a survey of the penal system of that State in 1920. A very thorough study of the penal system of Texas was begun by the Texas Committee on Prisons and Prison Labor in 1923 In all these studies the aim was to supply information in regard to the disciplinary, educational, vocational, dietetic, medical, and other aspects of penal and correctional systems on which improvements calculated to make offenders better members of society could be based. The Cleveland Foundation, after an exhaustive study of criminal justice in Cleveland, published its report in 1922; this covered police administration, prosecution of accused persons, criminal courts, correctional and penal treatment, medical science and criminal justice, legal education, and newspapers and criminal justice. The range of this and other studies showed a growing realization that whatever society does to an offender, from his first apprehension to his ultimate release from prison, is part of a continuous process, and that from the point of view of its effect on him, each step in the process must be taken into account

In general, actual treatment in penal and correctional institutions may be said to have responded slightly to the doctrine that, since all prisoners except those who are killed or actually confined for life, are ultimately restored to society, they should be so treated as to make them better members of society This has led, with other things, to an agitation for more vital education and a more educative vocational life Farm prisons on wide acreage have been established in several States, and more careful assignment of prisoners to work has been made in some prisons. The principles of the indeterminate sentence, probation, suspended sentence (especially for first offenders), separate or juvenile courts for children, and parole or after-care attention for released prisoners were accepted to a somewhat greater extent by judges, lawmakers, and prison officials; probation was slightly extended to adult offenders. On the other hand, the United States Supreme Court held that Federal courts did not have power to suspend sentence or to use probation; bills granting such power were presented at each subsequent session of Congress. The county jail, in which both sentenced prisoners and persons merely awaiting trial were commonly kept, was increasingly seen in a bad light, although little actual attempt was made to improve it or to alter its function. Under the influence of so-called "crime waves" in a number of cities, some Legislatures increased the severity of penalties; four States which had abolished capital punishment restored it. The War, too, had a deterrent influence on reform, although both in the United States and Great Britain it had in one way a good effect; prisoners sentenced under espionage and other war-time acts have, on their release, written vividly about prison evils and so awakened public consciousness toward them.

It is already evident that penology will in time be profoundly affected by developments during the decade in criminology These have to do with closer study of the heredity, environment, and mental peculiarities of individual offenders The purpose of such studies is twofold: first, to discover general causes of crime, secondly, to discover those causes operating in an individual which may make successful treatment more assured In such studies every branch of psychology is called into play. William Healy made perhaps the first notable contribution to the study of mental peculiarities in offenders when he published *The Individual Delinquent* (Boston, 1915), based on a study of juvenile law-breakers in Chicago Some earlier research had been done in Germany, and since then numerous detailed investigations of other groups have been undertaken The Bureau of Social Hygiene, originally organized at the New York State Reformatory for Women at Bedford Hills, N. Y., conducted several such studies A psychiatric clinic for the study of offenders was formed at Sing Sing under Osborne, and psychiatric work was done at other prisons Several States created the position of State criminologist In general, the theory underlying this development is that crime, like all conduct, is the reaction of a particular personality to a particular environment, and that successful therapy or reformative treatment requires the discovery of those factors in the personality or the environment, or both, which cause crime, and their removal or modification. Some courts made much use of diagnostic mental reports on offenders before sentencing them, and some prisons used such studies of inmates in treatment in prison. In general, however, actual application in institutions of psychiatric information and methodology was slight

Although the United States is the only great civilized country which does not gather its criminal statistics, a special committee of the American Bar Association made interesting comparisons in 1923. From 1910 to 1922, according to this committee, the general population in this country increased 14.9 per cent; the criminal population 16.6 per cent. Crime decreased noticeably during the War but afterward rose. The country continued to have far more crimes than western Europe. In all England and Wales in 1921 there were 63 murders,

and in 1922 there were 17 murders in London; the number of murders in France in 1919 was 585. In New York City alone there were 260 murders in 1921, and in Chicago 137; the estimated number of homicides in the whole United States in 1922 was 14,640. Of robberies, 95 were committed through England and Wales in 1921, and 121 in France. In 1922 New York City alone reported 1445 robberies; Chicago, 2417. The total number of persons in penal and correctional institutions in the country on July 1, 1922, according to the United States Census, was 163,889.

PENSIONS. See LABOR LEGISLATION; MOTHERS' PENSIONS; OLD AGE PENSIONS, SOCIAL INSURANCE

PEPPER, GEORGE WHARTON (1867–). An American legislator (see VOL. XVIII). In 1914 he participated in the movement for national preparedness. During the War he was chairman of the Pennsylvania Council of National Defense and in 1920–21 a member of the Commission on Constitutional Revision in Pennsylvania In 1915 he was Lyman Beecher lecturer at Yale Following the death of Senator Penrose he was appointed by the Governor of Pennsylvania to succeed him and held office until after the popular election in November, 1922, when he was elected by a plurality of more than 350,000 votes In June, 1922, he was chosen a member of the Republican National Committee to succeed Senator Penrose. On taking his seat in the Senate he assumed a prominent place in the debates and work of that body.

PERAK. See MALAY STATES, FEDERATED.

PERCEPTION. The problem of perception has been the stumblingblock of scientific psychology ever since its inception. The reason for this is quite simple. Positive science has always been committed to the atomistic analysis and to the mechanistic explanation in general. In the physical sciences the perception of objects, i e the perception of unities over and above the conglomeration of atomic elements, was always taken for granted; but psychology, so far from avoiding this problem, attempted to deal with it by the orthodox method of atomic divisions. Metaphysically, the task was complicated by the relation of body and mind, or matter and consciousness At the very outset of modern science the paradoxes of Descartes' mechanistic dualism had become apparent to every reflective thinker, and not even Leibnitz's ingenious hypothesis of preëstablished harmony could bolster up the belief in a strict causal correspondence between physical and mental events The psychological analysis of Locke, Berkeley, and Hume had later transformed the problem, and when nineteenth century psychology took the field, it had the great advantage over the Cartesians of coupling an improved physiological technique with a more refined method of psychological introspection. Withal, it was committed to psychophysical parallelism, and although this doctrine was discredited philosophically, it seemed to impose itself scientifically by the very necessities of experimentation

The orthodox method of explaining perception was to split up the problem into sensation, image, memory association, and attention The sensation was a unit element of psychological experience corresponding to a specific physical stimulus. As the sensation fades out of consciousness, it becomes a potential image, for the stimulus leaves a residue in the nervous system which is capable of arousing a faint copy of the original sensation. Since each sensation leaves behind it a separate residuum, there is a vast number of such residua in memory, each of which may be separately aroused, thus allowing for a certain independence of the original arrangement in which the sensations were experienced. At this point the doctrine of association is invoked to provide an *ad hoc* explanation for the selection of certain memories on the occasion of a particular stimulus instead of any others The doctrine of association dates back to Aristotle, and the reason for its long life is its ambiguous meaning, expressing as it does both a dynamic process and a static law of memory According to the doctrine, sensations or images tend to call up memory images which are similar or which have once been experienced in spatial or temporal contiguity with the present sensations or images All attempts on the part of modern psychologists to reduce similarity to spatio-temporal contiguity which could be measured quantitatively and statistically in the laboratory have failed. Now similarity of meaning in experience is not something that can be determined in advance, but *ex post facto* one may always say that a bond has become established between the old bit of experience and the new, in this case we are speaking of association as a dynamic process. It is questionable whether by this explanation we are really adding knowledge or whether we are not merely picturing the act of mnemonic imagination itself.

Similarity of meaning is thus seen to be the very nature of the associative process, for contiguity in time and space is but one of the lowest forms of this similarity and fortunately a form whose properties can be studied in advance of objective content. But for modern psychologists, as Koffka points out, meaning is itself explained by the working of associations which in themselves are meaningless. There is perhaps no better commentary on this attitude than the vast amount of experimental work which has been done on the memorization of nonsense syllables This work was performed on the theory that one was getting at the fundamental conditions of memory, but actually all that was accomplished was the formulation of statistical and contingent laws for the memorization of specific nonsense syllables, more laws and more nonsense syllables than even the most modern theories of education will have need for in the next 1000 years One may contrast with this type of experimentation the direct clinical methods invoked by the new psychology. So far from attempting to determine the conditions of memory and association along merely spatial and temporal lines, which must necessarily be limited at best to nonsense syllables, a psychiatrist like Jung attempts to determine concretely for a given person in a given situation the method behind that person's imagination. (See ASSOCIATION TESTS) He does this by noting down the random associations, together with any expressions of emotion, which certain words call forth from a patient The task here falls entirely on the psychiatrist, for there is no mechanical rule by which to measure the minds of all men; some general notions and a practical sympathy and skill on the part of the observer simply enable him to pic-

ture in his own mind the processes of his patient. It is, moreover, significant to point out the failure of the attempts made by Freud's disciples and by Freud himself to take the master's solution of specific dreams on the basis of certain symbolisms as scientific and all valid for all cases, instead of as suggestive examples to incite the use of one's creative imagination.

Turning now to attention, we find here the great scapegoat of experimental psychology. While every direct study of attention has sought to define it in terms of the stimulus and the physiological process, yet in experiments on perception it was treated as a mental element, as an unpredictable determining tendency which prevented the expected reaction from taking place. In short, so far from using a strict parallelistic procedure, experimental psychologists explained conscious phenomena in a physiological fashion whenever they could and then invoked mental concepts to explain discrepancies. Behind these mental concepts, such as attention, association, and memory, they indeed postulated corresponding physiological entities; but these were in no wise observable and amenable to scientific measurement. In Germany the school of the *Gestaltqualitat* or form quality, following up Wundt's conception of creative synthesis, had given up the attempt to maintain psychophysical parallelism in the higher mental processes. They emphasized the fact, well-known in music and duplicated in other phases of psychological experience, of the form of a perception existing over and above the so-called objective content. Thus a melody has a real quality over and above the physical notes of which it is composed, since it may be transposed to totally different notes, provided the order and rhythm are maintained. On this theory all higher perceptual acts are instances of forms which have reality of their own, although they are ultimately "founded" on sensations with their psychophysical relationship of stimulus and consciousness

Between the *Gestaltqualitat* psychologists, such as Meinong, Ehrenfels, and Witasek, and their radical descendants, the school of *Gestalttheorie*, there may be traced an evolution almost identical with that which occurred in philosophy in the descent from Locke to Berkeley and Hume. Locke began with sensation produced by external substances, and with reflection which the mind contributed to the ordering of its external impressions. Berkeley and Hume found the Lockian conception of external substances completely useless inasmuch as these substances could not be known except through the "higher" faculties of reflection, which in the nature of the case are subjective. And so the final result of the current of criticism which Locke started was the development of empirical or phenomenal idealism. In point of fact, what the *Gestalt* psychologists have done was to apply experimentally the idealistic criticism to structural and physiological psychology. Only recently Dr. J. S. Haldane, the eminent Oxford biologist, had publicly declared that although he was a physiologist he "could not for a moment agree with the assumptions on which what is called physiological psychology is ordinarily based. These assumptions appear to me as a mixture of very rudimentary physiology with a psychology which has been obsolete since Hume and Kant. It is doubtless the case that a very wide public is still ready to accept the assumptions in question, but a still wider public would accept the assumption that the sun goes around the earth." (*Proc. Aris. Soc.*, Sup. Vol. III, p. 65.)

Among the assumptions that Dr. Haldane had in mind is the constancy hypothesis, according to which a definite conscious sensation corresponds to every single stimulus. This assumption having been riddled experimentally by the proponents of form-quality, it remained for the more radical psychologists to show that the whole notion of an objective physical or physiological stimulus is quite misleading. They did this by reinterpreting in a new fashion the standard experiments with changing figures and perceptions of movement. In his laboratory studies of visual movement, Wertheimer showed how both the illusion and direction of movement could be obtained by preparing a pattern in the mind of the observer. Thus, if in the tachistoscope the experimenter exposes in succession two lines, first an oblique line making an acute angle with the horizontal, and then the horizontal itself, the observer will see the oblique line rotate in the direction of the horizontal, passing through the acute angle. Now if the experiment is repeated and the size of the angle is increased gradually until it passes a right angle and becomes an obtuse angle, the observer will still see the oblique line rotate in the original direction. If the experiment had been started with the oblique line making an obtuse angle, the illusion of rotation would have come about in the other direction, the illusion of movement being produced in the direction of the supplementary acute angle.

In the case of changing figures, which structural psychology had never been able to explain satisfactorily, even the subsequent distinction between form and objective content was valueless. Here there was no fixed physical content with a perceptual form superimposed, but rather there was an alternation of figure and ground, with the figure becoming the ground and the ground the figure when the meaning of the experience changed Add to these experiments the investigations of Köhler on the perceptual experiences of animals, the last resort of old-time physiological psychology, and the foundation was laid for a new systematic approach to psychological experimentation. The question which Köhler set himself to answer was this: if an animal is confronted with two stimuli and is trained to react positively to the one and negatively to the other, what has it learned? According to traditional theory the animal has formed a connection between the one sensation corresponding to the first stimulus and the positive reaction, and likewise between the other sensation and the negative reaction. Köhler, however, introduced an experimental variation which tested this theory. He placed before the animal two stimuli, *b* and *c*, the one lighter and the other darker, with variations in their spatial arrangement. From *b* food could be taken but not from *c*. After a certain amount of training, the animal invariably chose the positive *b*. Then this pair of stimuli was replaced by another pair, *a* and *b*, with *a* lighter than *b*. The animal now reacted not to the stimulus *b*, as the older theory would suppose, but to *a* as the lighter stimulus. The conclusion was

inevitable that animals learned to perceive structures and forms rather than identical physicochemical stimuli. The same set of experiments was repeated in the case of fowls, chimpanzees, and a three-year-old child, and the results were the same; this showed that the principle was sufficiently fundamental to be continuous in the biological realm.

The theory of perception which the new school of *Gestalt* psychology has built up is that in the act of perception the entire configuration is cognized and not an isolated object. If we see a specific object, we see it in much the same way that we appreciate the subject of a tableau. The centre or focus of the picture is unintelligible without the background. Carrying this analysis further back, the theory holds that in every act of perception the general psychological state constitutes the field or screen and the external stimulus the picture on the screen. Field and object are thus relative to one another, but the relation of relativity, if we may so speak, is not constant and predetermined. For certain configurations one may alter the background within various limits and not change the perception of the object. Again, object and background are relatively interchangeable but not absolutely so. This interchangeability or reversibility reaches its maximum in the case of the angular drawings and changeable figures mentioned above, which may be seen facing either "inward" or "outward at the will of the observer, provided his frame of mind has not been prepared According to this theory the experimental psychology of perception has for its task the determining of specific relationships existing between so-called objective stimuli and the various frames of reference in which they happen to be put. In other words, experimental psychological analysis would be no different from analysis of the artist who steps back from his picture and tries to see it at the distance from which it would be seen in the salon. The picture, we may say, remains the same, but the perception of the picture, which is what actually counts, varies in accordance as it is seen at six inches or at three feet distance, in accordance as it is seen with the eye of a connoisseur or with the untutored eye of the man in the street.

The *Gestalt* school has produced a number of echoes from America. R. M. Ogden in numerous articles expounded a theory of meaning embracing the general view of the new psychology. But the mass of experiments on perception will probably continue to be interpreted from the methodological approach of introspective structuralism with its postulate of psychophysical parallelism. See PSYCHOLOGY, GENERAL.

Bibliography. For the theoretical discussion of the problem of perception, consult the article by Kurt Koffka, "Perception: an Introduction to the 'Gestalttheorie,'" together with the appended references, in the *Psychological Bulletin*, vol. xix, 1922, p. 531. For additional references on the experimental side of perception, consult the *American Journal of Psychology*, vols. xxxiii and xxxiv, particularly the articles of F. L. Dimmick, M. Zigler, L. W. Cobbey, A. H. Sullivan, E. Bershansky, L. Knight, and E. Shults

PERIODIC SYSTEM. See CHEMISTRY.

PERKINS, FRANCES (1882–). An American sociologist, born at Boston, and educated at Mt. Holyoke College, the University of Pennsylvania, and Columbia University. From 1907 to 1909 she was secretary to the Philadelphia Research and Protective Association, and from 1910 to 1912, executive secretary of the Consumers' League. She was director of investigations for the New York State Factory Commission in 1912–13 and executive director of the New York Council of Organizations for War Service from 1917 to 1919. In the latter year she became a commissioner of the New York State Industrial Commission. She was a member of many sociological and economic societies and wrote *Life Hazards from Fire in New York Factories* (1912); *The Problem of Mercantile Fire Hazards* (1914); *A Plan for Maternity Care* (1918); *Women as Employers* (1919); and *A Social Experiment under the Workmen's Compensation Jurisdiction* (1921).

PERONNE. See WAR IN EUROPE, *Western Front.*

PERRY, RALPH BARTON (1876–). An American philosopher (see VOL. XVIII). After 1914 he concerned himself largely with practical and ethical problems. His books, *The Free Man and the Soldier* (1916) and *The Plattsburg Movement* (1921), deal with the problem of military preparedness in a democracy. *The Present Conflict of Ideals* (1918) is a companion volume to *Present Philosophical Tendencies*, and surveys the clash of consciences in the contemporary world. Professor Perry's other publications since 1914 include *An Annotated Bibliography of the Writings of William James* (1920) and numerous studies in American and French philosophical periodicals.

PERSHING, JOHN JOSEPH (1860–). An American army officer, born in Linn County, Mo., and educated at the United States Military Academy. He served in the Apache Indian campaign in Arizona and New Mexico in 1886, in Cuba in 1898, and in the Philippines from 1899 to 1903. In 1905 he was with Kuroki's army in Manchuria. In 1916 he was appointed major-general. In 1917 President Wilson made him commander-in-chief of the American forces in France, and he conducted their operations in the War with conspicuous success. In 1915 the tragic loss of his wife and three daughters, who were burned to death in a fire during his absence, roused the sympathy of the country. He was appointed chief of staff of the United States Army in 1921 and retired on Sept. 12, 1924.

PERSIA. A monarchy of southwestern Asia extending north from the Persian Gulf and the Gulf of Oman to the Caspian Sea. Area, variously estimated at from 628,000 to 635,135 square miles; population, from 8,000,000 to 10,000,000. The population was polyglot, and being scattered in widely separated centres, was difficult of control. In the west, Kurds, Armenians, and Arabs were to be found; in the northeast, Turks from Russian Turkestan; along the shores of the Persian Gulf, Arab and Negroid elements. Nomads numbered about 3,000,000; Europeans, 1200, of whom 600 were British. Populations of the principal cities were estimated as: Teheran, the

capital, 220,000; Tabriz, 200,000; Isfahan, 80,000; Meshed, 70,000; Kerman, 70,000. About 90 per cent of the population were Mohammedans of the Shiah sect.

Industry and Commerce. The large desert areas and the dependence upon irrigation for the cultivation of crops accounted for the comparative unimportance, economically, of agriculture. Grain crops and rice were raised for local consumption, while fruits, tobacco, cotton, and opium were exported to some extent. The keeping of sheep and sericulture supported the native carpet and silk stuff establishments. Wool and prepared skins also entered into the foreign trade. Mineral resources were extensive and included oil, iron, coal, copper, lead, manganese, marble, nickel, and cobalt, though none was worked except oil. The Anglo-Persian Oil Company (controlled by the British government) held concessions covering all but five northern provinces and though the workings were as yet confined only to a single area, the wells yielded 2,959,000, tons in 1922–23 and 3,775,000 tons (estimated) in 1923–24. The indications were that the Persian oil fields were among the richest in the world. In December, 1923, it was reported that the American company, the Sinclair Consolidated Oil Corporation, had received concessions in four of the five northern provinces. Complete ratification was to depend, however, on the approval of the Persian Parliament as well as on the ability of the American group to raise a loan of $10,000,000 for the government. The importance of oil in the economic life of the country may be gauged from the fact that while before the War its export was negligible and in 1915–16 was valued at only 21,758,000 krans (1 kran = 9 cents), by 1922–23 the oil export totaled 429,000,000 krans, being nearly 60 per cent of the entire exports. Exports for 1913–14 were 455,839,635 krans; imports, 647,164,841 krans. For 1922–23 exports were 733,982,943 krans and imports 619,201,046. The changing emphasis in the economic life was indicated by the following comparative figures in articles exported for 1913–14 and 1922–23 (in thousands of krans): fruits, 70,000 and 34,000; carpets, 54,000 and 93,000; cotton, 85,000 and 17,000; rice, 42,000 and 13,000; opium, 38,000 and 41,000; skins, 12,000 and 10,000; petroleum, 17,000 and 429,000. Leading imports remained cotton tissues, sugar, tea, yarn. Up to 1917 the country was barely touched by the War but following that year it suffered severely. The presence of the demoralized Russian troops through 1917, the depredations of the Turk in Azerbaijan and the rich plains of the Urumiah, and the flight of the Assyrian Christians accounted for great losses. Drought and famine visited the country in 1917; the influenza took its toll in 1918. Flocks and herds fell off greatly and through the shortage of forage many beasts of burden were lost. The interruption of commerce with Russia visited great distress on all industries. Before the War, imports from Russia totaled 355,000,000 krans and exports to it, 300,000,000 krans; in 1922–23 imports were 73,446,237 krans and exports 62,122,678, showing considerable improvement over 1921–22. Great Britain, Egypt, and Mesopotamia had in the interim forged ahead so that by 1922–23 they were taking the great proportion of the Persian products and supplying as well most of the country's wants. In 1922–23 exports to the United States were about $5,000,000; imports about $500,000. These more than trebled the 1913 trade.

Communications. Internal transport was carried on by caravan. To 1914, only 6 miles of railway were in existence. In 1916, a Russian constructed railway from Julfa (Perso-Russian frontier) to Tabriz (85 miles) was opened; another line from Pirebazar to Resht, 7 miles long, was also opened; a military railroad in southern Persia, 52 miles long, was constructed from Bushir to Borazjan; the railroad from Quetta to Nushki, in India, was extended to Duzdab. The total railway mileage was 350 miles. Before the War, Great Britain and Russia had launched ambitious projects for the railway development of the country, but the collapse of Russia and the outbreak of the War made the realization of any programme impossible. But the dependence of the economic exploitation of the country upon a decent system of transport turned British capitalists once more to the railroad problem. A scheme for a line from Teheran to Kuraitu on the Persian frontier to connect with the Kuraitu-Bagdad line and thence with the whole Bagdad system was under consideration.

Finance. The latest available figures for revenues were those of 1912–13 which amounted to £1,055,792. The increase in revenues may be ascertained from the gross customs receipts (a little less than half the total receipts) which were £1,398,725 in 1920–21. In addition to the loans made before the War, the following foreign debts were contracted British advances, 1912–14, £490,000, Russian advances, 1,891,500 rubles; British advances, 1915–17, £817,000; ditto, in krans, 1,000,000; ditto, 1918, in krans, 92,500,000; British loan of 1919, £2,000,000 (not advanced). By the treaty with Soviet Russia, of 1921, all Russian loans and advances were canceled. In 1920, a British financial adviser was appointed to the Persian government but he never actively functioned; in 1922, because of the increasing friendliness toward the United States, an American adviser was attached to the administration The first year's activity, 1923, showed a balanced budget, an increase in revenues by a better control of assessment and collection, and a movement toward the revision of taxation. The 1924 budget estimate carried $20,700,000 for revenue and $20,661,500 for expenditure. The Russian Banque d'Escompte was, in March, 1921, handed over to the Persian government by the Soviet officials as a result of the understanding that had been effected.

Army. The refusal of Persia to ratify the Anglo-Persian agreement of 1919 which provided for a uniform military force under British officers caused the collapse of the military establishment. All British officers and men were withdrawn after 1921. It was fortunate, for internal security, that the American fiscal commission was able to put finances into a decent order and allow for the creation of an army; it was equally fortunate that Persia had at hand an administrator to construct an efficient machine almost overnight. Under Riza Khan, and aided by an appropriation of two-fifths of the annual income, an army, with tanks, airplanes, mobile artillery, and wireless, was created, which in three years was able to pacify the province of Khorassan, disband the followers of the bandit Kuchik Khan, and the

Kurd robbers on the west, and subdued the long defiant Sheik of Mohommeseh. Pacification and tax-collecting went hand in hand.

History. That Persian Azerbaijan should become a theatre of war was inevitable in spite of the declared neutrality of the government. Turks aided by the Kurds marched on Tabriz and took it in January, 1915, only to be driven out soon after by Russian forces. Urmia was the scene of severe fighting in 1915, the Christian inhabitants in particular suffering at the hands of Kurds and Turks. Meanwhile British forces, beginning operations to the southwest in Mesopotamia, pushed into Persia to defend the pipe lines running from the oil wells at Maidan-i-Naftun and here encountered tribesmen in sympathy with the Turks The British were successful in expelling the hostile forces who fell back on Amara, thus leaving southwest Persia clear In the west and north the struggle continued between the Turks and Russians In 1916 the Turks had succeeded in dislodging the Russians from Kermanshah and Hamadan, which they held until the end of the year. In 1916, on the other hand, British operations became more aggressive A column under Sir Percy Sykes marched from Bandar Abbas to Kerman, put an end to the German influence among the tribesmen, and then penetrated into the heart of Persia to Isfahan Throughout 1917, Sir Percy Sykes worked effectively in the restoration of order in the province of Fars. Looting was stopped and the caravan routes opened Early in 1917, the fall of Bagdad in Mesopotamia had rendered the Turkish position at Kermanshah a precarious one so that a retreat back to the frontier followed. The British now pushed north to effect a juncture with their Russian allies but the disintegration of the Russian forces after the Russian Revolution put an end to what seemed an easy triumph The danger to India now seemed indeed real The impossibility of dispatching a heavy military force to the northern Persian frontiers compelled the British to resort to political measures. A mission was sent into the north in 1918, its objective being Baku, but was compelled to stop at Enzeli on the Caspian Sea, and then soon after, to retire to Hamadan. In the autumn the mission, reinforced, held Baku for a time, but Turkish forces compelled it to fall back on Enzeli once more. Meanwhile a second mission, working its way from Afghanistan through the northeast, reached the Transcaspian province in Turkestan and united with the Mensheviks against Soviet Russia. However, southern Persia once more began to present a serious problem. In early 1918, the Kashgais tribesmen in force attacked Sir Percy Sykes's small column at Shiraz and for months the British position was a precarious one. The support of the Persian government and the preaching of a holy war for a time presaged the complete destruction of the British unit But some sensational successes, and the gradual defection of the tribesmen, effected a triumph for Sir Percy Sykes and by October, 1918, the Kashgais were completely overthrown. The route from Bushire on the Persian Gulf to Shiraz was reopened by 1919

The continual presence of the British in the country, with the threat of complete submergence now that the Russian hold had been broken, prompted Persian leaders to appeal their case to the Peace Conference. Their demands included complete economic and political independence, territorial expansion, and reparation for the very heavy losses suffered at the hands of the warring nations. British intervention, however, prevented the presentation of these matters before the Conference so that the way lay clear for the Anglo-Persian Treaty of August, 1919. By the terms of this convention, the British government promised to respect the independence of Persia—with the following reservations: the British government was to supply expert advisers to the Persian government at the latter's expense; the British government was to furnish and equip a military force for the preservation of order in the country and on the frontiers, the British government was to grant a loan to be guaranteed by the customs revenues and other sources, railroads were to be built by British enterprise; the tariff was to be revised by Persian and British experts The agreement never received ratification, however. The growing influence of Soviet Russia in Persia strengthened its irreconcilable temper. In May, 1920, Bolshevist forces occupied Enzeli and by the end of the year the greater part of the province of Gilan was under their influence. The growing movement against Great Britain finally forced the British evacuation of Kazvin early in 1921; the last remnants of British participation in internal affairs disappeared with the departure from the capital of the British controller of Persian finances and the disbanding of the South Persian Rifles (September, 1921). In March, 1921, a treaty between Russia and Persia was signed by which diplomatic rights were accorded to the former while the Russian loans and advances were completely canceled, Russian concessions were abrogated, and Russia's special rights in the northern zone under the Anglo-Russian agreement of 1907 were renounced, the Capitulations were terminated, and the Russian discount and land bank was turned over to the Persian government. Free from Anglo-Russian domination, Persia in 1921 again turned to the United States for unofficial assistance and obtained the services of an American, Mr. A. C. Millspaugh, as financial adviser; other American experts were secured to aid in sanitation In 1923, boycotts were launched against British goods as well as imports via Mesopotamia. In this case anti-British sentiment was accentuated by a boundary dispute which opened old sores, for negotiations were begun regarding the revision of the former Turco-Persian frontier In measure as the Persian leaders grew more antagonistic toward Great Britain, they displayed a definite orientation toward the United States. The success of Mr. Millspaugh in reorganizing Persian finances and the cordial cooperation of Persian authorities with American experts helped to strengthen this policy Moreover, in the hope of securing ready capital, of which the country stood in desperate need, the government turned to American oil companies There ensued a tortuous series of quasi-diplomatic oil negotiations. When, in 1921, the Standard Oil put forth claims to exclusive oil exploitation in the five northern provinces, the Anglo-Persian Oil Company countered by presenting concessions which had been obtained by a certain Russian, Khostaria, in 1896 and 1916, and sold by him to a subsidiary of the Anglo-Persian; but the latter was willing to compromise by sharing the northern field equally with the

Standard. The Persian Mejliss, however, discountenanced this amicable arrangement, and, in December, 1923, the Persian government made a preliminary contract with the Sinclair interests for oil exploitation in four of the northern provinces, on condition that the concessionaires advance $10,000,000.

It was natural that the ferment of nationalism should begin to work soon in internal affairs. Young Persians, learning their lesson from Western methods, gained control of the government early in 1923 and agitated for a strengthening of the military establishment. Riza Khan, the leader of this movement, became prime minister on October 25, and with funds gained as a result of the fiscal reforms effected by the American controller, applied himself to reorganizing the army and establishing domestic tranquillity. Press reports early in 1924 indicated that the premier was fostering a republican agitation, inspired doubtless by the example of Nationalist Turkey; but so strong was the monarchist sentiment of the more conservative classes that Riza had to content himself with the deposition of the reigning but absentee Shah, and the succession of the latter's infant son to the throne.

PERU. A South American republic on the Pacific coast between Ecuador and Chile. No official census was taken after 1876, with the result that estimates must be unscientific in the extreme An estimate in 1922 put the population at 4,620,000 (as compared with 2,597,604 in 1876), though any increase in population was questioned in many quarters. The boundaries in 1924 were not definitively settled, estimates placing the area at from 679,600 to 722,461 square miles Lima, the capital, has a population of 173,000 and Callao, 52,000, according to a census of 1920; Arequipa was estimated to have a population of from 35,000 to 40,000.

Industry and Trade. Sugar, cotton and coffee continued to occupy the most important places in Peruvian agricultural life. Cotton culture in 1921 brought in 36,000 tons as compared with a crop of 26,170 tons in 1913. The values of cotton exported in the two years were: 1913, 1,424,000 Peruvian pounds; 1920, 11,190,061. In 1923, the value was 6,027,849 Peruvian pounds. The 1923–24 crop was greatly reduced by a severe drought. (The Peruvian pound equals the pound sterling at par. On Jan. 1, 1920, it stood at $4.74; in 1921, it averaged $3 64; in 1922, $4.10; in 1923, $4:135) Sugar production in 1921 totaled 300,000 tons as compared with 192,754 tons in 1912. Sugar exports in 1913 were valued at 1,380,000 Peruvian pounds; in 1920, 15,584,888; in 1923, 6,266,209 Among the minerals, copper up to 1920 occupied the leading place, the 1920 output being 32,982 metric tons with a value of 2,358,243 Peruvian pounds. This showed a negligible gain over 1913 output. The production in 1922 was 36,408 tons. On the other hand, petroleum production in the decade 1914–24 forged steadily ahead so that by 1920 the value of the output exceeded that of copper. In 1905, the petroleum production was worth not much more than £p125,000. In 1920, it reached £p2,494,570 and in 1921, £p3,618,955. In 1923, petroleum was exported to the value of £p4,446,561. Other important industries included: silver, vanadium ore, wool, cacao, guano, coca, and the making of Panama hats. Exports totaled $165,929,441 in 1920, $93,464,350 in 1922, and $99,037,331 in 1923, as compared with $45,871,504 in 1912. The leading imports were, in 1923, foodstuffs, cotton goods, metal goods, and machinery of all kinds. Imports for 1920 were valued at $86,283,654, for 1922 at $52,962,770, for 1923 at $58,437,089 as compared with $25,015,460 in 1912. The excess of exports over imports regularly mounted during the decade 1910–20, reaching the high figure of $79,645,787 in 1920. In 1921, for the first time the trade record showed an unfavorable balance of $42,520 In the period 1910–24, the United States forged ahead of Great Britain in Peru's commerce. The typical years shown in the table reveal the situation (in Peruvian pounds).

VALUES IN PERUVIAN POUNDS

	Imports from Great Britain	Imports from United States
1910	1,676 543	1,128,395
1914	1 598,605	1,570,723
1917	1,934,665	8,792,710
1920	2,694,195	10,168,937
1922	2,024,903	4,212,971
	Exports to Great Britain	**Exports to United States**
1910	3,403,127	2,032 510
1914	3,403,109	3 033 259
1917	3,792,750	10 942 407
1920	12,681,632	16,265,092
1922	6,592,071	6,582,712

In 1913, the United States furnished 28.8 per cent of the imports and received 33 2 per cent of the exports of Peru. In 1923, that country furnished 40.4 per cent of Peru's imports and took 40.1 per cent of Peru's exports. Other countries took the following portion of Peruvian exports: Great Britain, 32 9 per cent; Chile, 8.7 per cent; Argentina, 3.6, and Germany, 3 per cent. Great Britain supplied 20 2 per cent of Peru's imports, Germany, 10.5, Italy, 4.2, and Argentina, 3.7 per cent.

Communications. In 1922, there were 1935 miles of railway in operation. This was a gain of 216 miles over 1912. The Peruvian merchant marine consisted of only 15 steamers of 14,248 tons. The trade of the country was carried in foreign bottoms, the nationality of the 575 ships calling at Callao in 1921 being: 179 British, 106 Chilean, 25 Japanese, 112 American. In March, 1921, the Marconi Company took over the management of the Peruvian postal, telegraph, and wireless services for 25 years. In 1920, there were 8817 miles of telegraph line, 723 post offices and 19 wireless stations

Finance. In 1922, the revenues of the government amounted to £p7,032,506 and expenditures to £p8,083,183 (compare with the 1912 figures of £p3,425,543 and £p3,493,629). In 1913, the internal debt amounted to £p3,792,855, and in 1921 to £p4,641,290; the foreign debt in the two years was £p1,162,700 and £p934,840; the floating debt, £p5,302,457 and £p2,261,644. On Dec. 31, 1922, the total debt had increased to £p11,125,093 This was due to two loans contracted in 1922: a petroleum loan of $2,500,000 and a guano loan of £1,250,000. In 1922, also, a bill was passed authorizing a sanitation loan of $25,000,000. In the same year an important step was taken for the stabilizing of business affairs in the creation of the Reserve Bank of Peru (Banco de Reserve

del Peru), a central bank of issue and discount.

Government. Up to 1920, internal affairs were the exclusive concern of the central government located at Lima, and provincial matters were handled through a corps of prefects and subprefects, responsible entirely to the president. The new constitution of Jan. 18, 1920, the result of a movement toward decentralization, provided for the installation of three regional congresses in the north, south, and centre, with considerable local autonomy. The president's term was increased to five years and he was made ineligible for a succeeding term. (This provision was amended in 1923 to permit one reëlection.) The number of senators was fixed at 57; deputies at 128. An important step taken was the grant of absolute political and religious liberty, though Roman Catholicism was still retained as the state religion.

History. During the administration of Dr. José Pardo, 1915–19, Peruvian affairs centred, of course, on two main concerns; i e. the War, and the country's economic status which was so much dependent upon foreign markets. In spite of sympathies for Germany which so many of the upper class entertained, the infectious democratic doctrine of President Wilson gained great popularity in Peru, with the result that diplomatic relations with Germany were broken in 1917. After a single year's depression, 1915, Peru rapidly adjusted itself to the war situation, its raw products being greatly sought after by the belligerents; so that by 1919 imports had doubled, and exports trebled the figures of 1913 Because of its favorable trade balance in 1917, Peru received $13,505,-068 in bullion from the United States. The disputed election of May 18, 1919, resulted in the seizure of President Pardo by adherents of Augusto B. Leguía and the installation of the latter, first, as provisional president, and then as regularly elected president. Under Sr. Leguía (1919–24) ambitious projects were set under way for the modernization of the country. The president, committed to an extension of the federal principle, promulgated the new constitution (above) and invited foreign countries, through expert commissions, to participate in Peru's reconstruction. An attempt was made to attract immigrants in 1919 by an offer of free transportation; the construction of the Ayacucho-Cuzo railway to put the capital in touch with southern Peru was pushed; and a movement was made to withdraw the paper notes issued during the War for the establishment of a stable currency. In 1921, negotiations were started with a British-Canadian company for the construction of some 1500 miles of railway in various parts of the country. In 1922, a programme for important irrigation works was projected to centre around the Cañete and Moche Rivers. An American sanitary expert, beginning with 1919, was given full powers to stamp out malaria and yellow fever, and in 1919, General Gorgas was requested to undertake the sanitation of Peru's important cities. The General's death temporarily checked the plan. The reorganization of the army during 1919–21 was placed in the hands of a French commission and the navy, in 1920, under an American commission with full powers. In 1921, several American educational experts went to Peru and one of their number was made director of instruction. Finally, the beginnings of a labor code were attempted in 1924 with the passage of laws for workmen's compensation and the arbitration of industrial disputes. Results of these progressive activities were at once evident. By 1922, foreign interest had increased so enormously that it was estimated British holdings totaled $125,000,000, American $90,000,000, Italian $50,-000,000 and German $10,000,000.

In South American affairs, Peru's position was affected by its long outstanding controversy with Chile over the Tacna-Arica provinces. For the ramifications of this dispute see CHILE, BOLIVIA, TACNA-ARICA. The protocol signed by the disputants at Washington on July 15, 1922, to hasten the arbitration of the controversy was accepted in October by the Peruvian national congress, though by 1924 no settlement had yet been effected. Other boundary questions were settled more amicably; that with Bolivia in 1912, that with Colombia in 1922, and in the same year the Brazilian frontier.

PESTS, INSECT. See FORESTRY; HORTICULTURE.

PETAIN, HENRI PHILIPPE (1856–). A French army officer, educated at the Ecole de Guerre. In 1914 he headed an army corps in masterly retreat from Charleroi to the Marne, and in 1916, in command at Verdun, he defeated the great effort of the Germans to capture it. He became commander-in-chief of the French forces on the western front, May 15, 1916; infused new life and spirit in his men, maintained close relations with his allies in the same field, and struck the Germans with great energy at Verdun in August and at Chemin des Dames in October. He was made marshal of France at the end of the war and also became vice president of the Conseil Supérieur de la Guerre. See WAR IN EUROPE.

PETRIE, SIR WILLIAM MATTHEW FLINDERS (1853–). An English Egyptologist (see VOL. XVIII) He continued his excavations in Egypt till 1920. Among his later writings are: *Amulets* (1914); *Heliopolis* (1914); *Scarabs* (1917); *Tools and Weapons* (1917); *Eastern Exploration* (1919); *Some Sources of Human History* (1919); *Prehistoric Egypt* (1920); *Social Life in Ancient Egypt* (1923). See ARCHÆOLOGY.

PETROLEUM. In the ten-year interval from 1914 to 1924 few industries had experienced so great a development as that having to do with the production, refining, and utilization of petroleum. In 1913 the world's total production amounted to 385,347,000 barrels of 42 United States gallons, but by 1923 this had increased to 1,010,995,000 barrels, of which the United States produced 735,000,000, or 73 per cent of the total output of the world. The unprecedented demand for petroleum was due in great measure to the widespread use of the internal-combustion engine, especially as employed in motor vehicles. Along with this increased demand had come improved processes in refining as well as the exploitation and development of new fields. Outside of the United States, Mexico was the greatest producer, supplying, in 1923, 149,472,000 barrels, though in 1921 it had achieved a record of 203,521,000 barrels. From 1913 to 1923 Rumania had dropped from 13,554,000 barrels to 10,930,000, and Russia from 62,834,000 to 38,167,000. Persia on the other hand had increased from 1,-857,000 to 27,300,000, the Dutch East Indies

from 11,172,000 to 15,000,000, Peru from 2,133,000 to 6,375,000, and Argentina from 130,000 to 3,330,000 barrels

At the end of 1913 the total assets of the American petroleum industry were $1,136,718,000. At the close of 1921 they had increased to $6,383,632,000, and at the end of 1923 the total assets were estimated in excess of $9,000,000,000. In the 10 years from 1914 to 1924 the petroleum industry in the United States had attracted new capital to an amount between $2,500,000,000 and $3,000,000,000 which was used in the opening of new fields, for such purposes as drilling, pipe lines, and storage, not to mention the erection and equipment of numerous refineries.

In the decade under review one of the most important influences on the American petroleum industry was the great increase in the number of automotive vehicles (See MOTOR VEHICLES.) On Jan. 1, 1914, there were in operation in the United States 1,250,000 automobiles, which, by the close of 1923, had increased to more than 15,250,000, or a gain of 1100 per cent, while so far as the refineries were concerned the increase in the amount of crude oil to run them was but 176 per cent. In 1913 the average consumption per day in the United States averaged approximately 573,000 barrels, as compared with 1,592,000 barrels in 1923. The improvement in technical processes, and in particular the evolution and development of the cracking processes, brought a yield of 12 5 per cent of naphtha from the crude oil in 1913, up to nearly 31 per cent in 1923.

Important American Oil Fields. The years 1914–24 saw the development of many important fields in the United States, especially in California, Oklahoma, and Texas. Previously the most important fields under production had been the Sunset Midway in California, which was developed in 1900 and at the close of 1913 produced 140,000 barrels daily; Healdton, in Oklahoma, which came in early in 1912 and was producing 40,000 barrels; and the famous Cushing Pool in Oklahoma, which was producing in excess of 180,000 barrels, reaching its maximum in 1915 with 310,000 barrels. The Salt Creek oil field in Wyoming had been opened up in 1912, when it produced less than 20,000 barrels daily. Another important field developed in this period was the Santa Fé near Los Angeles, in California. It established a record of 340,000 barrels per day. Then Powell, Texas, brought into production in the latter part of 1921, and destined to be the world's largest producing field, produced a maximum of 315,000 barrels in the middle of 1923, but this declined in a few weeks to 145,000 barrels In 1915 both Augusta and Eldorado, Kan., were important fields which came into production, and in 1917 the Burkburnett, Texas, oil fields were added In 1917 came the Ranger oil field, also in Texas, and in 1918 and 1919 there followed West Columbia, Hull, and Desdemona, all in Texas, Hewitt, in Oklahoma; and Homer, in Louisiana.

The famous Huntington Beach field in California began production in 1919 and by 1923 had increased its output to 115,000 barrels In 1920 Burbank, Okla., an important mid-continental field, was brought in. Two other fields of that year were Eldorado, Ark., and Haynesville, La., together with Long Beach, Cal, Mexia, Texas, and Tonkawa, Okla Another field developed early in 1922 was Smackover in Arkansas. In 10 years the American petroleum industry had developed 23 active pools of major importance, of which all but two reached a maximum and then fell back to a position of secondary importance. The important petroleum fields in California contributed materially to the increasing production of the United States, but it was the opinion of geologists that the maximum production in California would soon be reached, as at the end of 1923 all the fields except three had passed their peak; and although new fields might be discovered and developed, it was thought that the final decline would be rapid when it came.

Mexican Production. In Mexico, the development of oil had begun only since 1901, with the first shipments taking place about 1904 In 1913 the total production had reached 25,696,000 barrels, of which 21,330,868 were exported. By 1921 it amounted to 193,398,000 barrels, from which it had declined to an output of about 150,000,000 barrels in 1923 This extraordinary decline seemed to indicate that the production of several of the producing areas in Mexico was at an end and that another source of bunker fuel oil must be looked for.

Persian Oil Fields. An even more rapid development has taken place in Persia, where petroleum on a commercial basis was not produced much earlier than 1913, when 1,758,000 barrels were produced. By 1923 this output had increased to approximately 27,300,000 barrels, and there were in operation pipe lines for delivering the oil to Abadan, at the head of the Persian Gulf, whence tank steamers carried the crude oil to the refinery of the Anglo-Persian Oil Company at Suez, which supplied the market of the Near East Crude petroleum was also loaded on tankers for shipment to Europe, and during the year ending July 31, 1922, a total of 69 tankers carried 607,248 tons of crude oil in bulk, passing northward to the Suez Canal and bound from the Persian Gulf ports for Swansea in Wales, where the Anglo-Persian Oil Company had constructed and completed in 1922 a refining plant, one of the largest in the world outside of the United States and Mexico With this plant and with other refining works contemplated in England, this company, which enjoyed the support of the British government would soon, it was believed, be in a position to take care of the demand for petroleum products throughout the British Isles.

The wells of this company are in the Maidan-i-Naftun district, about 50 miles northeast of Ahruz on the Karun River, and in 1922 they produced in excess of 50,000 tons a month. In addition to these fields, which lie in southeastern Persia, there are important other fields in northern and eastern Persia for which the Anglo-Persian Company in 1923 were applicants for concessions, as were also the Standard Oil Company of New Jersey and the Sinclair Consolidated Oil Corporation. The Persian government objected to additional grants to the Anglo-Persian Company on the ground that further influence in Persian affairs was not altogether wholesome, and accordingly the concessions at the end of 1923 for the absolute control and development of oil deposits of four of the northern provinces of Persia was awarded to the Sinclair Consolidated Oil Corporation. The government retained one of the northern provinces for its own purposes. Naturally such rich oil fields attracted the large

oil corporations, and their respective governments were active in their behalf. See PERSIA.

South American Petroleum. In South America there had been developments in several of the states, and the large world oil companies were looking for concessions wherever conditions were promising. In Peru the production in 1923 was estimated at 5,508,985 barrels, an increase from 2,071,000 in 1913, and oil concessions were sought in the departments of Amazonas, San Martin, Loreto, and Pinra. In Colombia a law of Jan. 31, 1923, made more liberal land-leasing regulations, and numerous American companies were seeking concessions. After Peru, the leading South American source of production was Venezuela, which had developed rapidly up to some 4,000,000 barrels, and the Argentine Republic, where out of an estimated production of 3,200,000 gallons, the government reserve at Comodoro Rivadavia, which first became an important producer in 1914 with 275,131 barrels, contributed some 2,343,000 in 1923 The government owned and operated a fleet of five tankers with a capacity of more than 27,000 tons of oil, which transported the oil from the port of Comodoro Rivadavia, 1000 miles south of Buenos Aires, to that city, and to Rosario, Sante Fé, Bahia Blanca, or other cities where storage facilities are maintained.

Transportation of Oil. That the American oil industry is highly organized is particularly evident in connection with the transportation. At the very outset there were required pipe lines, which take the oil from the wells and carry it to the refineries where it is treated. From a total mileage of a little less than 40,000 at the close of 1913, the American pipe lines had increased to approximately 75,000 miles at the close of 1923 This figure represented all the pipe lines employed by gathering and transporting companies engaged in the business of carrying oil. The main oil pipes alone aggregated in excess of 34,000 miles. These pipe line companies must either build into a new field or extend their existing lines to take care of the new production. In 1923 about 2,000,000 barrels of crude oil were gathered and transported for producing purposes every 24 hours, if moved in tank cars, this amount would have required at least 10,000 such carriers on sidings adjacent to the fields every day in the year. Of course a certain number of tank cars are employed to move the crude oil or the subsequent products, and in 1921 approximately 137,500 tank cars were so employed in the United States and Canada for this purpose

Marine Transportation. As California increased its crude oil production, it developed storage and bunkering facilities at Los Angeles harbor. It was found that oil could be shipped from Californian ports by tank vessels through the Panama Canal eastward cheaper than the pipe line charges from the mid-Continent fields to the same destination. Likewise it could compete with oil brought to the Atlantic coast of the United States from Mexico, notwithstanding the fact that each shipment involved a round trip of approximately 10,000 miles. As the distance was so much greater, more than twice the tonnage necessary to transport the same amount of oil from Mexico to the Atlantic coast refineries must be employed in this traffic. Nevertheless in 1923 tank steamers made a total of 1704 transits through the Canal and constituted about 34 per cent of the total number of ships passing through the Canal during the year. These vessels paid an aggregate of nearly $9,000,000 in tolls, or 39 per cent of the total annual revenues. Their movement, both ways, aggregated 9,625,714 tons of cargo, 38 per cent of the total shipment through the Panama Canal. A modern tank vessel can now be loaded at the rate of 25,000 barrels per hour and discharged at a rate of 10.000 barrels per hour, or 6 and 14 hours respectively for a tanker of 140,000 barrels capacity. The use of these tankers has not been exclusively to transport oil from the oil fields to refineries but also for the use of oil-burning ships, which have increased materially in numbers and capacity in the merchant marine not to mention the various navies. In 1913, out of a total world's merchant tonnage of 24,444, 23,779 burned coal. In 1923, out of 29,246 vessels 24,380 burned coal and 4866 burned oil, or an increase in oil-burning tonnage of 1030 per cent as against the two per cent increase in coal-burning tonnage It was estimated that the fuel consumed by such vessels in 1913 was less than 3,000,000 tons, whereas for 1923 it was over 23,000,000 tons, or an increase of 710 per cent, while the consumption of coal for steamship bunkers increased to 3 per cent. See INTERNAL-COMBUSTION ENGINES.

Increase in American Refining Capacity. In 1913 the total consumption of crude oil in the refineries in the United States amounted to 573,000 barrels. Ten years later this figure had risen to 1,587,000 barrels, and from this amount nearly 150,000,000 50-gallon barrels of naphtha, or nearly 31 per cent of the crude oil handled, were obtained, whereas in 1913 a volume of about 22,000,000 50-gallon barrels, or 12 5 per cent naphtha, was obtained from the crude oil distilled. The chief reason for this large increase was the development of the cracking process, designed to secure the largest possible amount of naphtha, as previous to 1913 the crude oil treatment was mainly with the object of producing illuminating oil. With the production of naphtha limited to the natural naphtha content of the crude oil, and the small percentage secured through cracking or decomposition of the heavier applications in the ordinary fractionated still, in order to secure a greater output of gasoline and in view of the fact that there was no adequate outlet for the production of the other products, a pressure still was developed by Dr. W. N. Burton of the Standard Oil Company, in which "cracking" could be carried on in an efficient manner, so that in 1922 about 25 per cent of the total gasoline production of the United States was obtained through cracking at pressures above that of the atmosphere.

In 1923 there were something like 2000 pressure cracking units of various designs in operation, with an estimated production capacity of 45,000,000 50-gallon barrels of naphtha a year, about twice the total production of naphtha in 1913. The annual production of naphtha would be divided approximately somewhat as follows: 132,000,000 barrels of crude oil in refinery operations, 22,000,000 barrels recovered from natural and casinghead gas, and 40,000,000 barrels in cracking operations at or above atmospheric pressures The demand for gasoline with the increased number of motor vehicles, tractors,

airplanes, motor boats, etc., led to the development of various means to provide gasoline in addition to those mentioned. In the first place it was found possible to remove the light volatile naphtha from natural gas and then at the crude oil wells at so-called casinghead plants, where absorption by compression methods was used to save the light naphtha, and finally a combination of these last two methods. This work was developed so that where once it was hardly possible to handle the volatile naphtha on account of evaporation loss, and it was permitted to go back into the gas system for burning as fuel, there were derived in 1923 about 22,000,000 42-gallon barrels by these methods. (See NATURAL GAS.) Another method of extracting gasoline was to treat the noncombustible gases in the refinery operations, where the gas had been previously burned as fuel, and then the development of cracking methods where pressures up to 350 pounds or more were employed, where, as in the case of the Standard Oil Company of New Jersey's processes, it was found possible to crack the whole range of petroleum products from refining distillate to the heavy fuel residues of the crude oil itself.

Oil Production. Reference has been made to the increase in the amount of gasoline products and the decline in the amount of illuminating oil This is also shown in the export statistics of the United States, where, in the year 1913, there was a total of 40,751,416 50-gallon barrels of crude oil and products exported, of which 23,388,825 barrels were illuminating oil and 3,760,867 barrels were gasoline, in addition to which there were over 7,000,000 barrels of gas oil and fuel oil During the War, when some 90,000,000 barrels of oil were used in the fighting area, of which at least 95 per cent was American oil, the export figures of course were abnormal, but up to the year 1923 the total exports had reached 79,743,740 barrels, an increase of 96 per cent over the 10 years previous. At this latter point the exports of illuminating oil (kerosene) were about 17,000,000 barrels, or but three-fourths of what they were in 1913, while the exports of gasoline, naphtha, and other oil products amounted to nearly 17,000,000 barrels, or a 350 per cent increase, and the exports of gas oil and fuel oil amounted to 24,571,880 barrels, or a 242 per cent increase.

Fuel Oil. By 1913 the Mexican crude oil, the production of which in that year amounted to 25,696,000 barrels, not only became available in quantity but with the increased output could be used for fuel oil for steamship bunkers. This led to the extensive use of fuel oil in the shipping industry of the world and also for boiler furnaces. The method of treating the Mexican oil is to top the lighter crude oil for naphtha, retaining perhaps 85 per cent of the crude for fuel oil, while in the case of the heavier Mexican crude oil it has been topped merely to give the necessary flash test. In 1914 the gas and fuel oil business of the United States amounted to 74,681,000 50-gallon barrels, while in 1923 the United States Bureau of Mines recorded its business as having increased to 241,483,834 barrels. In connection with the Mexican crude oil it was possible to derive a number of asphalt products used for roofing, street paving, and other purposes. This asphalt business, which in 1914 was 465,000 tons, in 1923 had increased to 2,373,000 tons. See ASPHALT.

Public Aspects of the Industry in the United States. It has already been suggested that the great demand for petroleum and petroleum products which developed in the 10 years following 1914 led to many national and international political developments. It was realized that the supply of oil was variable and that many sources would be exhausted in comparatively short periods, even with appropriate conservation measures. In the United States in particular, the rapid exhaustion of the oil lands was regarded as a national question. On Sept. 27, 1909, President Taft, in response to the general demand for conservation, withdrew 3,000,000 acres of public lands in California and Wyoming from "location" under the Placer Mining Law, especially to meet the future needs of the government, of which quite important was the matter of oil fuel for naval vessels. It was also realized that fuel oil was an important asset and necessary for the operation of a fleet with modern engines. To conserve an adequate supply for the future, President Taft on Sept. 2, 1912, created Naval Oil Reserve No. 1, at Elk Hills, Cal, to contain 38,969 acres, and followed it on December 3 of the same year with Reserve No. 2, near Buena Vista Hills, Cal., containing 29,341 acres It was considered desirable that further national oil reserves should be established, and on Apr. 30, 1915, President Wilson created Reserve No. 3, near Casper, Wyo., containing 9481 acres, which then and afterward was popularly known as "Teapot Dome." In the shale oil regions in Utah Reserves No. 4 and No. 5 were established.

After the conclusion of the War the administration of the naval oil reserves was turned over by Secretary of the Navy Denby to Secretary of the Interior A B. Fall in spite of the protest of several naval officers. From this time on, the oil reserves became a matter of considerable interest and figured extensively in political developments in the United States This was due principally to the fact that Secretary Fall leased Naval Reserve No. 3 (Teapot Dome) to H. F. Sinclair, the head of the Sinclair Oil Company, who turned it over to the Mammoth Oil Company in exchange for $106,000,000 worth of stock. This was early in April, 1922, and in April, 1923, the Doheny interests included under the direction of Edward L. Doheny, head of the Mexican Petroleum Corporation, received a preferential right to lease Naval Reserve No. 1 under a contract to perform certain work for the United States Navy at Pearl Harbor, in the Pacific, where a naval base was located and where oil supplies were considered of strategic and practical importance.

Toward the end of the year 1923 the Senate Public Lands Committee engaged in an investigation of the entire subject, which by this time had developed into a considerable scandal, involving former Secretary Fall, who had retired from the cabinet in March, 1923. A subcommittee of the Senate continued the investigation, which brought out considerable sensational testimony but much difference of opinion as to the advisability of making the leases in view of surrounding circumstances. This committee submitted a report which criticized the leases and the part played by several officers of the government, and these leases were canceled and a commission appointed to investigate the en-

tire matter. It was unfortunate that the essential facts were obscured in the political aspect of the situation, and by the middle of 1924 the actual merits of the matter had not been determined outside of the laxity of certain government officials.

During the War there was a great demand for petroleum and petroleum products, but the post-war peace requirements for oil were considerably in excess of the war demands In 1923 the oil wells of the United States produced one-tenth of all the oil hitherto forthcoming in the country up to 1924, and in that year it was estimated by petroleum geologists that the original supply of the United States was more than 40 per cent exhausted.

Bibliography. The frequent reports of the United States Geological Survey and of the United States Bureau of Mines, also the annual issues of *The Mineral Industry*, afford considerable information, particularly on the statistics of the petroleum industry. From time to time the American Petroleum Institute in New York also publishes valuable bulletins and technical papers presented at its annual meetings. A most complete and useful work is *Handbook of the Petroleum Industry*, 2 vols., D T. Day, editor (New York, 1922). Other recent volumes of value are V. R. Garfias, *Petroleum Resources of the World* (New York, 1923); L C Uren, *Petroleum Production Engineering* (New York, 1924); J. M Macfarlane, *Fishes, The Source of Petroleum* (New York, 1923), Dorsey Hager, *Practical Oil Geology* (New York, 1919); id., *Oil Field Practice* (New York, 1921); R. H. Johnson, L. G. Huntley, and R. E Sommers, *The Business of Oil Production* (New York, 1922); J. E. Pogue, *The Economics of Petroleum* (New York, 1921); Victor Ziegler, *Popular Oil Geology*, 2d ed., (New York, 1920); United States Geological Survey, *World Atlas of Commercial Geology*, Part I, *Distribution of Mineral Production* (Washington, 1921); United States Bureau of Standards, *National Standard Petroleum Oil Tables, Circular No 154* (Washington, 1924). See MEXICO, MESOPOTAMIA, CHESTER CONCESSION; SAKHALIN; SHIPBUILDING, *Oil Fuel;* CHEMISTRY, ORGANIC; GEOLOGY.

PETROVA, OLGA (1886–). An actress born in Warsaw, Poland, and educated at Paris, Brussels, and London. She began her theatrical career at the age of 20 in Shakespearean productions and later appeared in plays of Ibsen, Bernstein, and Strindberg. After making her American stage début in New York City in 1911, she gave some time to motion pictures and appeared in *The Daughter of Destiny; The Orchid Lady; Bridges Burned*, and *More Truth than Poetry*, written by herself. She herself wrote *The White Peacock* and *The Hurricane* in which she starred

PETRUNKEVITCH, ALEXANDER (1875–). A Russian-American zoölogist, born at Pliski in Russia, and educated at the University of Moscow and at Freiburg. He was lecturer in zoölogy at Harvard (1903–04); acting professor (1906) at the University of Indiana; honorary curator of arachnida at the American Museum of Natural History (1909–11); and professor of zoölogy (1918–) at Yale. He published· *Gedanken uber Vererbung* (1903), *Free Will* (1905); *Index Catalogue of Spiders of North Central and South America* (1911); *Terrestrial Palæozoic Arachnida of North America* (1913); and *Morphology of Invertebrate Types* (1916).

PETZOLD, JOSEPH (1862–). A German university professor (see VOL. XVIII). He contributed numerous articles to philosophic journals on the physical theory of Einstein as viewed from the standpoint of positive relativism. He also published a volume on *Biologische Grundlagen des Strafenrechts* (1920).

PHASE RULE. See CHEMISTRY, PHYSICAL.

PHELPS, ALBERT CHARLES (1873–) An American architect and educator, born at Lockport, Ill., and educated at the University of Illinois and in Germany. In 1899 he was appointed instructor in the College of Architecture of Cornell University and was successively assistant professor, professor, and World War Memorial Professor of architecture (1920) there. He contributed to architectural journals and lectured at the Metropolitan Museum of Art.

PHILADELPHIA. The third city of the United States. The population rose from 1,549,008 in 1910 to 1,823,779 in 1920 and to 1,922,788 by estimate of the Bureau of the Census for 1923. Much was done between 1914 and 1924 to improve the port. In 1915 the two Southwark piers were completed by the city as the first units of a scheme to give the city a municipally owned water front of more than a mile. The complete development of the plan involved a series of piers, each with a railroad track down the centre connecting with the belt lines on Delaware Avenue, giving access to all the industries along the river. It was expected to cost $24,000,000. The Delaware River was dredged to the sea to a depth of 35 feet. The Navy Department in 1916 began a concrete drydock 1064 by 212 feet, capable of holding any American vessel. During the War the shipyards at Hog Island received orders from the Shipping Board for 120 vessels of 7500 tons and 60 vessels of 8800 tons capacity. Congress appropriated $62,000,000 for the yards, and 50 shipways were laid down and put to work

The municipal government was reorganized in 1920. A small council of 21 members replaced the old bicameral council of 144, the budget system was adopted, model civil service reforms were introduced, including provision for a civil service commission of three persons, and the prohibition of any political activities by firemen or policemen. A city purchasing agent and a city architect were appointed, and radical changes made affecting city contracts.

The city-planning commission submitted a zoning plan dividing the city into residential, commercial, industrial and unrestricted use districts, five height districts, and five area districts. Eleven miles of elevated railroad were built during the ten years, from the Market Street elevated north and northeast, roughly parallel with the course of the Delaware River. It was made to be as noiseless as possible, the steel supports being partly filled with concrete to minimize their vibration, and the rails laid in a roadbed of broken stone. The cars also were specially constructed for silence. In 1918 a $6,000,000 bond issue was voted for a new subway system which was to run north and south under Broad Street, crossing beneath the older subway at City Hall. Before a great deal of work had been done, however, the increasing costs caused by war-time conditions forced postponement of construction. In 1923

it was decided to take up the work once more. Construction was to begin at once on the four track subway under Broad Street from Olney Avenue to Spruce Street, and on the two track subways under Ridge Avenue, Eighth Street, Walnut and Chestnut Streets, and the elevated roadway to the southwest and Darby. The whole work was estimated to cost approximately $90,000,000.

Work was begun in 1921 on a suspension bridge over the Delaware River from Philadelphia to Camden It was to have a central span 1750 feet long, surpassing all previous suspension bridges by 150 feet, and was to be 3536 feet from anchorage to anchorage, and 8126 feet long including the approaches. For a distance of 800 feet the bridge cleared high water by 135 feet. The total cost of the bridge, which was to be borne by the two States of Pennsylvania and New Jersey, and by the two cities of Camden and Philadelphia, was estimated at $22,479,000; and the cost of the real estate which must be bought was $5,392,000. It was hoped to have the work completed by July 4, 1926, when the city planned to celebrate the 150th anniversary of the signing of the Declaration of Independence. A bascule bridge over the Schuylkill was built by the city under the direction of the Bureau of Surveys and opened in 1923. See RAPID TRANSIT.

PHILIPPINES. The largest island group of the Malay archipælago, a possession of the United States since 1899. The population of the Philippines increased from 7,635,426 in 1903 to 10,314,310 in 1918. The estimated population in 1922 was 10,768,323. The population per square mile was 67 in 1903 and 90 in 1918. The population designated as Christian numbered 6,987,686 in 1903 and 9,381,357 in 1918. The non-Christian population, 647,740 and 932,953. The population in 1903 as regards sex included 3,496,652 males and 3,491,034 females, in 1918, there were 5,177,568 males and 5,136,742 females. By races: the brown race numbered 6,914,880 in 1903, 9,386,826 in 1918; the yellow race 42,097 in 1903, 50,826 in 1918; the white race 14,271 in 1903, 12,390 in 1918; the Negro race 1019 in 1903, 7623 in 1918. In 1903, 6,931,548 persons had attained Filipino citizenship and in 1918 this number had increased to 9,428,291. By religions, there were 6,559,998 Roman Catholics in 1903, and 7,790,937 in 1918. The Protestants in 1918 numbered 124,575; the Mohammedans 443,038; Pagans, 508,596; Buddhists, 24,263, and all others, 5454. There are no earlier figures for these last classifications. The largest cities, with their populations, are as follows: Manila, 219,938 in 1903, 285,306 in 1918; Cebu, 31,079 in 1903, 65,502 in 1918; Albay, 14,049 in 1903, 52,756 in 1918; Iloilo, 19,054 in 1903, 49,114 in 1918; Lepa, 37,934 in 1903, 46,577 in 1918; San Carlos, 9974 in 1903, 42,453 in 1918. Other cities having a population of over 35,000 in 1918 are Batangas, Argao, Laoag, Ormuc, and Carcar.

Mineral Production. The islands of the Philippines have important mineral resources. Deposits of gold, coal, petroleum, quicksilver, copper and platinum exist, especially in the department of Mindanao and Sulu. What apparently was one of the largest available unexploited iron deposits in the world is located on the Pacific coast in the Province of Surigao and extends from tidewater to the interior, perhaps to the adjacent province of Agusan. In the decade 1913-23, the Bureau of Science did valuable work in the examination of mineral resources in the islands, and there was a considerable development in mining during that period. In 1915, seven companies were operating mines; this increased in 1918 to eleven; it fell, in 1919 to two, and in 1920 to three. The chief activity during this period was in the examination of oil and coal fields. In 1920, American drillers began boring for oil on the Bondoc peninsula. The production of gold was 1,937,941 fine grams in 1918; 1,970,651 in 1919; 1,920,753 in 1920; and 1,976,096 in 1921. The silver production was 128,974 fine grams in 1918; 261,558 in 1919; 307,343 in 1920; and 814,621 in 1921. These are the only metallic metals of importance mined in the islands. Of the non-metallic, the chief products are coal, lime, mineral waters, salt, sand and gravel, and stone. The coal production in 1918 was 15,663 metric tons; in 1919, 32,892; in 1920, 58,088, and in 1921, 39,445. The production of lime in 1918 was 15,000 metric tons; in 1919, 20,000; in 1920, 3000; and in 1921, 3500. The total value of mineral products in 1918 was 3,915,095 pesos; in 1919, 4,622,241; in 1920, 5,126,711; and in 1921, 3,520,520.

Agriculture. In the decade 1913-23, as in the previous years of American administration, vigorous and unremitting efforts were made to encourage and extend agriculture, which is the principal source of welfare of the islands and the chief occupation of the people. The results accomplished were nothing short of remarkable. They were brought about by improving communications on land and sea; lowering freight rates; furnishing expert professional advice; encouraging the building up of agricultural schools; urging the youths of the country to devote themselves to agriculture; by continued efforts to eradicate epidemic diseases among horses, cattle and carabaos; by vigorous campaigns against locusts; by the enactment of health legislation, and in various other ways. During the decade the Department of Agriculture also encouraged the raising of poultry and the breeding of hogs, cattle and other animals with a view to increasing the food supply. It encourages the breeding of carabaos, cattle and horses for work purposes. Under the supervision of the Bureau a very careful study was made, with a view to prevention and control of rinder pest, a disease which every year carries off many thousands of carabaos. Rigorous regulations were applied against the importation of cattle from countries affected with rinder pest and other cattle diseases and a rigid quarantine was constantly maintained. The agricultural crops are often affected by drought and other disadvantageous conditions. Following the successful rice crop of 1913, the crop of 1914 was damaged by a great drought, which resulted in a decrease of 25 per cent in the production The substitution of corn as a food product made considerable headway during the decade. The crop for 1914 was 6,265,746 cabans, an increase of 44 per cent over the preceding year. The production of corn was 309,799 metric tons in 1918; 332,636 in 1919; 431,268 in 1920; 402,714 in 1921; and 375,362 in 1922. The most important crop in the islands is rice. The area under cultivation increased from 1,244,937 hectares in 1914 to 1,661,430 hectares in 1922. The production increased from 977,682,959 kilos in 1914 to 1,124,000,000 kilos in 1922. The value of

the product increased from 57,261,760 pesos in 1914 to 139,935,080 pesos in 1922. Second in point of value of the product is sugar cane. The area cultivated increased from 169,436 hectares in 1914 to 240,820 hectares in 1922. The value of the sugar cane increased from 28,631,545 pesos in 1914 to 59,948,250 pesos in 1922. Third in importance is coconuts: the production increased from 591,266,399 nuts in 1914 to 1,407,684,000 in 1922, while the value increased from 25,651,764 pesos in 1921 to 55,267,680 in 1922 The production of abaca, or manila hemp, which is an important industry, decreased from 137,635,563 kilos, valued at 29,968,009 pesos in 1914 to 121,046,019, valued at 19,918,860, in 1922. The tobacco industry showed a decrease also; in 1914, there were produced 46,731,463 kilos valued at 7,109,367 pesos, and in 1922, 29,927,000 kilos valued at 6,019,870 pesos. The production of coffee, on the other hand, increased during the decade. The production in 1914 was 626,408 kilos valued at 302,771 pesos, which increased to 1,149,000 valued at 822,800. The production of cacao increased from 565,802 kilos in 1914 with a value of 354,057 pesos, to 984,000 kilos with a value of 1,148,100 pesos in 1922 The total area of land cultivated under the nine principal crops in 1917 was 2,721,182 hectares, out of a total area of 29,625,974 hectares. This had increased in 1919 to 3,005,322 hectares. The total area of cultivated farms increased from 1,298,845 hectares in 1903 to 2,415,778 hectares in 1918. The total area of farms, including cultivated and uncultivated, increased from 2,827,704 hectares in 1903 to 4,563,723 in 1918. The average size of the cultivated farms decreased from 159.3 hectares in 1903 to 123.6 in 1918.

The progress of the live stock industry in the islands is indicated by the statistics in the

	1913	1916	1918	1920
Cattle	418,114	567,456	601,297	760,920
Carabaos .	1,047,164	1,228,836	1,338,082	1,464,285
Horses and mules .	179,089	203,364	234,041	268,999
Goats	529,180	661,859	751,077	821,661
Sheep	104,147	142,091	165,686	195,705
Hogs	2,086,736	2,734,803	2,894,403	3,369,183

table. It may be noted that in 1916 the cattle and carabaos killed by rinder pest numbered 18,251, in 1918, 15,747, in 1920, 16,911 and in 1922, 34,306 In spite of the difficulties encountered, gratifying progress was made in the production of crops in the Philippines, especially in the last three years of the decade. In 1920 there was a production far in advance of any previous annual period. In 1917 the aggregate value of six leading crops was 241,000,000 pesos; in 1918 it advanced to 350,000,000 pesos; in 1919 to 458,000,000 pesos and in 1920 to 687,000,000. While much of this increase in the money value was due to prevailing high prices, there was an increase in the acreage under cultivation and in the yield. In 1920, less rice was imported than in the previous year and the production came nearest to meeting the demand for home consumption Corn also showed an increase in acreage and in value. The veterinary division of the Department of Agriculture and Natural Resources performs valuable services by inoculating cattle against rinder pest with an anti-rinder pest serum. During 1920, over 10,000 animals were immunized by inoculation. Several experiment stations are maintained in the islands as well as breeding stations for horses, cattle, swine and poultry. The Plant Industry Division exercises supervision over plant and seed selection, tests fertilizers and conducts exploration and investigation into various subjects connected with plant industry. In 1922, 12 stations and 17 projects were maintained.

Manufactures. While the manufacturing development in the Philippines has not kept pace with agricultural and commercial development, there has been considerable progress, as is indicated by the fact that the number of establishments increased from 3259 in 1903 to 8354 in 1918; wage earners increased in number from 79,906 in 1903 to 143,465 in 1918; capital invested increased from 53,159,580 pesos in 1903 to 22,473,592 in 1918; and value of the products increased from 41,700,215 pesos in 1903 to 356,094,433 in 1918, while the value added by manufacture increased from 16,650,763 pesos in 1903 to 195,217,279 in 1918. The manufacture of sugar is the most important industry. Its rapid development may be shown by the fact that the value of the product in 1903 was 6,603,006 pesos and in 1918, 82,145,962 pesos. Oil works rank second in value of product, and had a remarkably rapid development, increasing from a value of 302,032 pesos in 1903 to 59,722,483 in 1918. Rice mills increased the value of their product from 1,010,965 pesos in 1903 to 43,462,805 in 1918 · The abaca or hemp-pressing industry is also important; the value of the products in 1918 were 44,844,566 pesos. There were no comparative figures for 1903 as this industry had not then developed. The product of cigar and cigarette factories increased from 8,740,516 pesos in 1903 to 26,623,275 in 1918. Other important industries are lumber mills, rope factories, tailor shops, boatbuilding, lithography, printing and bookbinding. The manufacture of coconut oil and copra is of great increasing importance. In 1922, there were produced 366,808,888 kilos of copra and 2,656,813 kilos of coconut oil.

Transportation. The length of the railway lines in the islands increased in the island of Luzon, from 883 60 kilometers in 1913 to 1,039.14 in 1922. In Cebu and Panay the mileage remained stationary at 212 kilometers in the two periods. The total passenger and freight revenue in the lines of Luzon, which includes the city of Manila, increased from 4,878,767 pesos in 1913 to 11,033,400 in 1922. In the city of Manila, there were about 80 miles of electric railways which carried over 36,000,000 persons annually. The number of automobiles in the islands increased greatly; in 1922 there were about 10,000, and nearly 3000 automobile trucks. The mileage of telephone wire increased from 9123 kilometers in 1918 to 10,360 in 1922. There were, in 1922, about 36,000 kilometers of telephone wire.

Education. The development of education in the islands has been one of the chief concerns of the government since the establishment of American rule, and the efforts have been extraordinarily successful. From the establishment of the Bureau of Education in 1900, a great public school system has been developed in the islands. This achievement has been made possible only through persistent struggles against adverse conditions. Buildings and equipment had to be renewed and teachers had to be trained. The people in general had to be

educated to appreciate the value of the public schools and their interest in them and their readiness to support them is in distinct contrast to the apathy which existed at the time the system was founded. Their change of attitude is an indication of an intellectual awakening which scarcely finds a parallel in history. At the time the Bureau was established, there were over 1,000,000 children of school age in the islands and it was the aim of the bureau to bring 800,000 of these into the public schools at the earliest possible date. In 1913–14, the annual enrollment for the school year was 621,000. This had increased in 1921–22 to 1,077,342. The average monthly enrollment in the latter year was 975,092, and the average daily attendance was 909,947. The problem of teachers was a very serious one; at first a large portion of the instructors in the schools were American, but the training of Filipino teachers at the Philippine Normal School, the Philippine School of Arts and Trades, the provincial secondary schools, the intermediate schools, and the University of the Philippines resulted in a large proportion of well-trained native teachers. The number of male American teachers decreased from 268 in 1917–18 to 134 in 1921–22, while the male Filipino teachers increased from 8421 to 14,417. The number of female American teachers increased from 138 in 1917–18 to 231 in 1921–22; Filipino female teachers in 1917–18 numbered 4400 and 9253 in 1921–22.

Special forms of education, such as physical, agricultural and industrial instruction were successful from the beginning. In 1920, there were over 250 agricultural schools; 15 of these were classed as agricultural schools, 14 as farm schools and 222 as settlement farm schools. The famous Central Luzon Agricultural School at Munoz is said to be the best institution of its kind in the Orient. Improvement in the quality and quantity of the industrial work done in the public schools was steady. In 1919–20, the school children produced industrial articles worth over 1,300,000 pesos. Records attained by students of the public schools of the Philippines in the carnival interscholastic games and Far Eastern meets show conclusively that physical education also was receiving the closest attention. Instruction in civics, hygiene and sanitation is given in the first six grades of the public schools. The spread of education among the non-Christian tribes has been a difficult problem. The purpose of the Bureau of Education has been to bring these people to the same cultural level of their Christian brethren and at the same time to strengthen the bond of union between them and their Christian kinsmen. To bring about this result, a large number of Christian Filipino teachers were assigned during the decade 1913–23 to these provinces. In 1920, there were 1728 of these teachers. In addition to the public schools there were many private schools in the island. These, in 1921–22, numbered 525, with a total enrollment of 64,835, over double the enrollment of 1913. The total expenditures for public schools in 1922 was 16,382,348 pesos, compared with 6,262,778 pesos in 1913. In 1921–22, there were in the islands 371 public vocational schools. Of these 338 were schools of agriculture; 23 were trade schools and 7 were normal schools. The University of the Philippines at Manila steadily increased in influence and importance. It is composed of the Colleges of Agriculture, Education, Engineering, Liberal Arts, Law, Medicine and Surgery, Veterinary Science, Junior College of Liberal Arts, and Schools of Dentistry and Pharmacy. Also connected with the university is the Conservatory of Music, School of Fine Arts, School of Forestry, School of Nursing, and University High School. The total attendance in 1921–22 was 4063 compared with an enrollment of 1398 in 1913.

Finance. Financial conditions in the islands suffered in the decade 1913–23 from the disturbances created in general by the War and also by local conditions. The Philippine National Bank, the largest financial institution in the island (see *Banking*, below), suffered during 1920 as a result of an extension of its loans for the development of the industrial and commercial resources of the islands. This had an unfavorable result on the finances of the Territory. The general progress of financial administration during the decade will be noted from the fact that the receipts for the fiscal year 1913 amounted to 26,979,400.64 pesos and the expenditures to 29,608,082.54 pesos. In 1920, the receipts amounted to 90,905,779.72 pesos and the expenditures to 75,511,145.73 pesos. There was a surplus at the end of the year of 15,394,633.99 pesos. In 1922, the receipts of the insular government amounted to 130,649,853 and the expenditures to 78,911,424, leaving a surplus of 51,738,430 pesos. The bonded indebtedness of the islands in 1913 was 32,250,000 pesos, and in 1922 was 149,420,000 pesos.

Trade and Commerce. The development of trade and commerce in the islands during the decade 1913–23 is shown by a comparison of figures for several years of the decade. The total foreign trade in 1913 amounted to 202,171,484 pesos, of which 106,625,572 were imports and 95,545,912 exports. The total trade had increased by 1918 to 467,587,387 pesos, of which 270,388,964 were exports and 197,198,423 imports. In 1920, the total trade exceeded 600,000,000 pesos, but owing to adverse conditions in the two years following, it fell, in 1922, to 351,561,885 pesos, of which 191,166,526 were exports and 160,395,289 were imports. The total trade of the United States in 1922 amounted to 223,699,852 pesos, compared with 86,220,558 in 1913. The exports in 1922 to the United States amounted to 128,223,201 pesos and the imports from the United States to 95,476,651 pesos. The most important articles exported from the islands are copra, sugar, hemp, tobacco and oils. The leading articles imported are cotton and its manufactures, agricultural implements, iron and steel, and oils. The domestic commerce in 1922 amounted to 981,782,066 pesos, compared with 661,640,304 pesos in 1914.

Health and Sanitation. Perhaps the greatest problem faced by the American government in the Philippines was the spreading of ideas of modern sanitation among the people. For the most part the average Filipino is born, lives and dies without medical attendance or nursing. There is also great lack of hospitals and dispensaries. Although great progress was made in sanitation during the decade 1913–23, especially during the first years of the period, there was a steady increase in recent years in the number of preventable diseases, especially typhoid, malaria, beri-beri, and tuberculosis. Epidemics of cholera and other diseases were frequent. The death rate per 1000 in the is-

lands was 16.817 in 1913; 18.553 in 1914; 35.467 in 1918; 19.385 in 1921. As a result of intensive general vaccination, smallpox almost entirely disappeared from the islands. Cholera, however, continued more or less prevalent. There was an outbreak of considerable intensity in 1916. Typhoid fever caused many deaths, and systematic anti-typhoid vaccination carried on by the health service contributed much to the gradual diminution of this disease. An active educational campaign was carried on through the decade by public conferences, lectures, administrations, pamphlets and other measures. Leprosy, which is common in the islands, was greatly reduced by the administration of various esters of chaulmoogra. A leper colony is maintained at Culion, where about 500 persons receive this treatment annually. Much excellent work was done by missionary societies during the decade in the establishment of hospitals and dispensaries The Rockefeller Foundation also contributed money and personnel with excellent results. A school for sanitary inspectors was conducted, which included a six months' intensive training course for the nurses

Banking. The resources of the banks in the Philippines increased from 63,745,929 pesos in 1913 to 431,405,077 in 1920. In 1922, they amounted to 326,203,461 pesos. The Filipino National Bank was established in 1916 and by law was made the depository of all provincial and municipal governments All government funds were transferred from other banks to this bank. As the result of inefficient management, the bank suffered a series of losses in 1920 which reached a total of $22,500,000 The American government, becoming alarmed at the situation, secured the services of an experienced banker from the United States under whose guidance the bank was placed on a sounder footing A large part of the assets, however, had been loaned to concerns which for many years will be unable to repay them. These were chiefly sugar centrals and coconut-oil factories. The bank also established branches and agencies throughout the islands in charge of which were placed untrained Filipinos, and these branches, without exception, were mismanaged. These losses seriously involved the Philippine government and its credit was severely impaired by the fact that it was not able to meet its obligations.

Government. The insular government is divided into the legislative, executive and judicial branches. At the head of the executive branch, since the passage of the Organic Act of 1916, is the governor-general, who is appointed by the President, by and with the advice and consent of the Senate. He is assisted in the performance of his duties by the department secretaries. All these, with the exception of the secretary of public instruction, who is also vice governor-general and is appointed by the President, were Filipinos in 1924. These officers are appointed by the governor-general. The other officials of the government, appointed by the President, are the auditor, and the deputy auditor, and the nine justices of the Supreme Court. As regards provincial government, the Philippines are divided into 48 provinces, 36 of which are known as regularly organized provinces and the remaining 12 as specially organized provinces. The chief executive of a province is the provincial governor, who in a regularly organized province is an elected official. He, together with the other two elected members, forms the provincial board which constitutes the legislative branch of the provincial government. In some of the specially organized provinces, the provincial governors are elected and any other appointive officials There are in the Philippines 890 municipalities The executive of a municipality is called a municipal president. The municipal council, which is the legislative branch of the municipal government, consists of from 8 to 19 councilors, depending on the size of the municipality. The Legislature is made up of the Senate and the House of Representatives. Of the 24 senators only two are appointed by the governor-general. All the others are elected by popular vote. The 93 representatives are also elected, with the exception of nine, who are appointed.

Judiciary. The administration of justice is entrusted to the Supreme Court, in the courts of first instance, the municipal court of the city of Manila, and the courts of justices of the peace. The Supreme Court is made up of nine justices, one of whom is chief justice. Decisions of the Supreme Court may be appealed to the United States Supreme Court in certain cases.

Political Events. The decade 1913–23 included some of the most important events since the American occupation. It was marked by the passage by Congress, in 1916, of an Organic Act which established the form of government for the islands. From 1913 to 1916, the period was marked by political changes which had a marked influence on the later political history of the Territory. From 1907 to 1913, under the influence of the Philippine Commission, many constructive measures were passed and special emphasis was placed upon the improvement of education and the construction of permanent improvements From 1913 to 1916, the restraining influence of the Commission was withdrawn by the appointment of a majority of Filipinos in that body.

In September, 1913, Francis Burton Harrison was appointed Governor-General of the Islands of the Philippines, succeeding W. Cameron Forbes. In conformity with his previously announced policy, President Wilson nominated a majority of the Filipinos as members of the Commission. Since the membership of the lower house of the Philippine Assembly was already composed entirely of elected Filipinos, this placed the majority vote of the Filipino legislation in the hands of the Filipino people. The Legislature in 1914 passed many important measures, especially relating to finances. Governor Harrison carried on the policies of the Federal administration by appointment of an increasing number of Filipino heads of the executive branches of the government. During 1914 there occurred the so-called Ricarte movement A man of this name, from a refuge in Hongkong, attempted to create an uprising among the more ignorant classes of persons in Manila and elsewhere This was quelled without serious trouble. In 1915, the greater part of the legislative sessions was devoted to consideration of financial reform and the economic development of the islands. During this year there were practically no disturbances requiring the attention of the constabulary in any part of the islands. The year 1916 was signalized by

the passage in Congress of a new Organic Act which was approved by President Wilson on Aug. 29, 1916, and which did away with the Philippine Commission and established a governor-general as the executive head. It established the executive, legislative and judiciary departments as described in the paragraph *Government* above.

The first session of the Philippine Legislature created by the bill convened in Manila on Oct. 16, 1916. For the first time in the history of the islands, the non-Christian tribes were represented in the legislative branch of the government.

Congress, in 1917, passed no measures directly affecting the Philippines. The Immigration Act passed in that year applied to the islands but only until superseded by an act of the Philippine Legislature on the subject. The first election for senators in the Philippines was held in October, 1916, and at the meeting of the Legislature on October 16 of that year, the Philippine Commission ceased to exist. The session of the Legislature held in 1917 created a new budget system which was approved by the President. A currency act provided for the reduction of the bullion value of Philippine coins when circumstances required, and made other provisions in relation to the currency.

The year 1919 was one of political activity and economic disturbance in the islands, as a result of conditions brought about by the end of the War. The statements of the Allied leaders during and after the War in regard to the rights and liberties of small nationalities had been widespread in the Philippines and led to a demand on the part of a strong political element for immediate independence. Immediately after the signing of the Armistice, the Filipino Legislature appointed a commission to the United States ostensibly for the purpose of establishing improved economic relations, but before its departure for the United States the commission was instructed to present the case for immediate independence. The agitation for independence, while it continued in 1920, was less strenuously advocated. By 1920, all the branches of the government, except the Supreme Court, had been Filipinized. Following the election of President Harding in 1921, Governor-General Harrison resigned and was succeeded on October 15 of that year by General Leonard Wood, who, with W. Cameron Forbes, formerly governor-general, had been appointed as a special commissioner to the Philippines to examine the political and economic conditions. The Commission arrived in Manila on May 4, 1921, and at once undertook a general survey into the government and conditions of the islands. Following General Wood's service as chairman of the Commission, he was appointed, in October, 1921, governor-general of the islands. General Wood and Mr. Forbes, in their report on the work of the Commission, recommended that the present general status of the Philippines continue until the people have had time to absorb and thoroughly master the power already in their hands. They recommended also that the governor-general have authority commensurate with the responsibilities of his position. The report concluded as follows: "We recommend that under no circumstances should the American government permit to be established in the Philippine Islands a situation which will leave the United States in a position of responsibility without authority."

At the very outset of his administration, Governor Wood found himself bitterly opposed by the aggressive advocates of independence. Controversy over appointments and other details of administration in 1922 resulted in a demand on the part of political leaders for Governor Wood's recall. He was, however, upheld in all his acts by President Harding. The Legislature of 1921 and 1922 provided for the issuance of bonds in the amount of $5,000,000 for the purpose of protecting the financial interests of the government. Two parties, the Collectivista or coalition party, headed by Manuel Quezon and Señor Osmena, the two most powerful politicians in the islands, and the so-called Democratic party, were the most important political organizations in the islands. The Collectivistas carried on, from 1921 to 1924, an aggressive campaign for independence and against the administration of General Wood. The Democratic party took the more moderate position. While it stood for independence, it assailed the leaders of the other party as grossly corrupt and charged them with misapplication of funds. In February, 1923, the Legislature chose Isauro Gabaldon and Pedro Guevara resident commissioners in Washington. The Collectivistas refused to coöperate with Governor-General Wood in the work of the legislation. The Philippine Independence Commission, in November, 1923, appointed Manuel Roxas speaker of the Insular House of Representatives, commissioner to visit Washington and explain the Filipino side in the controversies with the governor-general. A resolution was introduced in Congress, in December, for an investigation of the administration of General Wood in the Philippines. The resolution failed of passage. The Filipino Independence Commission, in January, 1924, presented to Congress a memorial denouncing the administration of General Wood and asking for the immediate independence of the islands. In March, 1924, Señor Roxas presented the arguments for independence to President Coolidge, who replied in a letter reviewing the Philippine situation and declaring that "Although they have made wonderful advances in the last quarter of a century, the Filipino people are by no means equipped, either in wealth or experience, to undertake the heavy burden which would be imposed upon them with political independence. Their position in the world is such that without American protection there would be the unrestricted temptation to maintain a costly diplomatic service and an ineffective but costly military and naval service." He said also "The Government of the United States has full confidence in the ability, good intentions, fairness and sincerity of the present Governor-General. It is convinced that he has intended to act, and has acted within the scope of his proper and constitutional authority." The Insular Affairs Committee of the House of Representatives, in March, 1924, voted the report granting independence to the islands. This was afterwards modified to provide for such independence in 25 years. No action was taken on this resolution prior to the adjournment of Congress in June, 1924.

PHILLIPS, CHARLES (1880–). An American poet and playwright, born at New Richmond, Wis., and educated there and in

Toronto. He had much experience as an editor, and during the War served overseas. Among his best books are: *Back Home—An Old-Fashioned Poem* (5th ed., 1913); *The Divine Friend*, a poetic drama produced by Margaret Anglin in 1915; *Tarcisius*, a drama (1917); *A Buccaneer of Christ* (1918); *A Saint for Soldiers* (1918); *The New Poland* (London, 1923); *The Teachers' Year* (1924).

PHILLIPS, WILLIAM (1878–). An American diplomat, born at Beverley, Mass., and educated at Johns Hopkins University and the Harvard Law School He was private secretary to the Ambassador to Great Britain from 1903 to 1905 and served in various capacities in the State Department until 1908. He was appointed chief of the division of Far Eastern affairs and then became First Secretary of the American Embassy in London. He served again in the State Department and from 1917 to 1920 was Assistant Secretary of State. From the latter year to 1922 he was minister to the Netherlands and was appointed Under-Secretary of State in 1922. In 1924 he was appointed Minister to Belgium.

PHILOLOGY, CLASSICAL. The 10 years dating from Aug. 1, 1914, were trying years for one who sought to survey the wide field of classical philology. The War in Europe, 1914–18, interrupted the publication of periodicals and books, especially the former Even in 1924, conditions in the book trade abroad were still unbalanced. It was hard to find out what was being published abroad, and still harder to obtain copies of books.

Inevitably, therefore, in the present article the major emphasis is laid on the work of American classical scholars. Further, it is possible only to discuss certain marked movements and tendencies, and to name a few of the more important books. The books named will be, for the most part, selections from the extensive lists given in the *New International Year Books* 1914–23.

In *The Nation* (New York), May 11, 1911, Prof. Paul Shorey, of the University of Chicago, in a paper entitled "American Scholarship" (reprinted in *The Classical Weekly*, vol. iv., pp. 226–230), supplied adequate proof that American classical scholarship need not fear comparison with the classical scholarship of Germany, or England. At the semicentennial of the American Philological Association, in December, 1919, Professor Shorey returned to the subject, in a paper entitled "Fifty Years of Classical Studies in America." At the same meeting, Prof. F. G. Moore, of Columbia University, traced the history of the American Philological Association, and Prof. M. Bloomfield, of the Johns Hopkins University, considered "Fifty Years of Comparative Philology in America." For these three papers see *Transactions of the American Philological Association* (vol. 1, pp. 5–83).

In the decade, American classical scholarship suffered grievous losses through the deaths of the following scholars (the name of the university with which the scholar was connected at the zenith of his career is given in parenthesis): Frank Frost Abbott (Princeton), Charles E. Bennett (Cornell), John M. Burnam (Cincinnati), Basil Lanneau Gildersleeve (Johns Hopkins), Thomas D. Goodell (Yale), Tracy Peck (Yale), Bernadotte Perrin (Yale), Samuel Ball Platner (Western Reserve), Moses S. Slaughter (Wisconsin), Kirby Flower Smith (Johns Hopkins), James Rignall Wheeler (Columbia), and John Williams White (Harvard).

Professor Gildersleeve, whose death occurred on Jan. 9, 1924, was for 40 years editor of the *American Journal of Philology*. In the *Year Book* for 1921, p. 553, reference was made to the fact that vol. xl, No. 4, of that journal appeared on Oct. 3, 1921, the ninetieth anniversary of the birth of Professor Gildersleeve, and that the whole volume was dedicated to him. The number mentioned contains an "Index Scoliodromicus," of 13 pages, which lists Professor Gildersleeve's extrasyntactical contributions to the *American Journal of Philology*, and supplements the "Indiculus Syntacticus," published in the same periodical (vol. xxxvi, 1917), a bibliography of Professor Gildersleeve's long array of very valuable notes, published in the *American Journal of Philology*, in the sphere of syntax.

One of the most interesting developments during the decade was to be seen in the efforts made, especially in England, America, and Germany, to bring a knowledge of the contents of the classical authors, and of their value, to a wider array of readers. Of prime importance here is the Loeb Classical Library, whose aim is to present all the more important classical authors, Greek and Latin, with the ancient text on one page and an English translation on the opposite page. For general observations on the Library see *The Classical Weekly* (vol. v, pp. 126–127; vol. vi, pp 82–86, 127); for detailed discussions (by C. Knapp) of various volumes of the Library see *The Classical Weekly* (vol. vii, p. 192; vol. xii, pp. 49–50, 57–58, 65–66; vol xiii, pp. 145–147, 153–154, 161–162, 169–170; vol. xv, pp. 187–190, 197–199; vol. xvi, pp. 185–186, 193–195; vol. xvii, pp. 169–170, 177–178, 185–186.

Another important movement in this field is represented by the series of volumes entitled *Our Debt to Greece and Rome*, published under the general editorship of Prof. G. D. Hadzsits, of the University of Pennsylvania, and Prof. D. M. Robinson, of The Johns Hopkins University. For the plan and the scope of the series, see the *New International Year Books* for 1922 and 1923.

In Germany, the series of volumes whose purpose is to popularize the classics is entitled *Das Erbe der Alten*. More pronouncedly scholarly, but still of interest to the general reader, are such works as *Einleitung in die Altertumswissenschaft*, under the general editorship of A. Gercke and E Norden; *Die Hellenische Kultur*, and *Die Hellenistische-Romische Kultur*, both edited by F. Baumgarten, F. Poland, and R. Wagner and *Die Griechische und Lateinische Literatur und Sprache*.

A very important work in classical philology in the decade was the establishment of two new series of classical texts. Germany had long had an authoritative series of texts of the classical authors, both Greek and Latin—the famous Teubner Series. By 1924, the Oxford University Press had, in the course of 30 years, in the Oxford Classical Text Series, presented a fair array of texts of authors. Greek and Latin, edited by competent scholars, in most cases English. During the War, Messrs. Paravia and Company, Italian publishers, began a series entitled *Corpus Scriptorum Classicorum Paravianum* (see *The Classical Weekly*, vol. xi,

p. 200, xv, 135–136; *Year Book* for 1918, p. 493). The *Corpus Paravianum* was to show the manuscript text, with emendation only where the manuscript tradition gives no sense; otherwise, conjectural alterations proposed or accepted in other editions were not even to be mentioned.

About 1917 or 1918, French scholars began the publication of a series of texts of authors, Greek and Latin, under the patronage of the Association Guillaume Budé, which derives its name from Guillaume Budé, the great humanist of the French Renaissance, the founder of the Collège de France. In each instance, the text, with a brief critical apparatus, and a translation, in French, were to be given. There were published editions (with translations) of parts of Plato, Æschylus, Sophocles, Pindar, Aristotle, Aristophanes, Cicero, Seneca, Tacitus, as well as complete editions of Lucretius, Persius, Juvenal, Catullus, and Petronius. Under the head of literary and historical studies, the Association published also a *Histoire de la Littérature Latine Chrétienne*, by P. De Labriolle, and of *Sénèque Prosateur, Etudes Littéraires et Grammaticales sur la Prose de Sénèque le Philosophe*, M A. Bourgery.

In Germany certain monumental works had long been under way, before 1914, whose aim was to make accessible what was known (or conjectured) in various fields of classical philology. The most ambitious efforts of this sort were the *Handbuch der Classischen Altertumswissenschaft*, and the classical encyclopædia known by the abbreviation "Pauly-Wissowa"

The *Handbuch* was begun under the editorship of Iwan von Müller. After 1922, a thorough revision, under the direction of W. Otto, in progress In the 50 years that had elapsed from the time the publication of the *Handbuch* was begun, the horizon of the classical scholar had been greatly widened, particularly through the discoveries connected with the so-called Minoan civilization. This extension of knowledge took scholars back several millenia of the point at which, five or six decades previously, classical civilization was supposed to begin. Scholars had gained, also, a far better understanding of the relation of the historic classical civilization to the civilization that preceded it, in the Mediterranean Basin, on the European side, in Egypt, and in Asia. Hence, in the revision of the *Handbuch* new topics were being included, such as "Grundriss der Politischen Geschichte des Alten Orients," and "Kulturgeschichte des Alten Orients," to each of which a volume was to be devoted. The title of the *Handbuch*, in view of this wider range of its subjects, was altered to *Handbuch der Altertumswissenschaft*.

Pauly's *Real-Encyclopädie der Klassichen Altertumswissenschaft* was begun as long ago as 1830. A revision was undertaken, in 1890, by G. Wissowa; the first part of this appeared in 1894. The work, in 1924, was under the direction of W. Kroll and W. Witte. Between 1913 and 1924, four enormous volumes, carrying the first part of the encyclopædia forward from "Helikon" to "Kynegoi," were published. To facilitate the progress of the work, what was called a "Zweite Reihe" was begun in 1920. Two volumes of this, covering the articles "Ra" to "Sila," had been issued (1920, 1921). In 1918 appeared also *Supplementband III*, dealing with "Aachen" to "Ad Iuglandem"; *Supplementband IV* was issued in 1924.

Another great German undertaking, *Ausführliches Lexikon der Griechischen und Römischen Mythologie*, begun by W. H. Roscher, with the coöperation of many scholars, was virtually complete. The great *Thesaurus Linguae Latinae*, the most comprehensive and authoritative of all Latin lexicons, made some progress during the decade. In France, the Great *Dictionnaire des Antiquités Grecques et Romaines*, by Daremberg and Saglio, was completed during the decade.

A significant movement in the United States was the attention paid to the classical element in English literature. Important studies here were *The Relation of Latin and English as Living Languages in England During the Age of Milton*, W. P. Myers; *The Influence of Horace on the Chief English Poets of the Nineteenth Century*, Mary R. Thayer; *Horace in the English Literature of the Eighteenth Century*, Caroline Goad; *Vergil and the English Poets*, Elizabeth Nitchie; *The Classical Mythology in Milton's English Poems*, C. G. Osgood; *Classical Mythology in Shakespeare*, R. K. Root; *Ovid and the Renascence in Spain*, R Schevill (1913); *The Traditions of European Literature from Homer to Dante*, Barrett Wendell. For discussions of these works, see *The Classical Weekly* (vol. xii, pp. 171–173, 177–179, 185–188; vol. xiv, pp. 25–29; vol. xvi, pp 13–16).

During the 10 years, increasing attention was paid to the papyri discovered from time to time, especially in Egypt. These were studied in part for the light they throw on works of classical writers already known, by giving recensions of the ancient text hundreds of years older, in some instances, than the earliest manuscripts. They were examined also for additions to the store of classical texts. Illustrations of the profits of such study are to be seen, for example, in the volumes of *Oxyrhynchus Papyri*, edited by the English scholars, Messrs. Grenfell and Hunt (see, for instance, *The Classical Weekly*, vol. xiv, pp. 14–16; *The Classical Review*, vol. xxxiv, pp. 67, 179; *The South Atlantic Quarterly*, April, 1914), and in such a book as *New Chapters in the History of Greek Literature, Recent Discoveries in Greek Poetry and Prose in the Fourth and Following Centuries B.C*, by J. U. Powell and E. A. Barber (1921). A striking illustration of the value of the papyri in yet a third field, the study of Greek life and Roman life, is afforded by an important volume, "A Large Estate in Egypt in the Third Century B.C., A Study in Economic History," by M Rostovtzeff, published as *University of Wisconsin Studies in the Social Sciences and History, No. 6* (1922). The author undertook to assemble into a complete picture the 350 papyri, or more, that give the correspondence of a Carian Greek named Zenon, manager of a great estate of land, originally unimproved, which Ptolemy II (Philadelphus) turned over to his Treasurer of Finance, a Greek named Apollonius. For a review of this book by Prof. W. L. Westermann, of Columbia University, see *The Classical Weekly*, vol. xvi, pp. 110–112.

Towards the end of the decade, through efforts organized by Prof. F. W. Kelsey, of the University of Michigan, various American universities had come into possession of papyrus documents. These were being studied by va-

rious scholars. In the *Transactions of the American Philological Association*, vol. liii (1922), Prof. J. G. Winter, of the University of Michigan, discussed "Some Literary Papyri in the University of Michigan Collection." Prof. C. Bonner, of the same university, discussed "A Papyrus of Dioscurides in the University of Michigan Collection." This gives part of a work entitled *De Materia Medica*, by Dioscurides of Anazarba. At the meeting of the American Philological Association at which these two papers were read, Prof. A. G. Laird, of the University of Wisconsin, presented a paper on "The Wisconsin Papyri," and Prof. A. E. R. Boak, of the University of Michigan, discussed "The Record Office of Tebtunis and Cersesuchon Oros." The last named paper dealt with a register of contracts for a period of four months, Apr. 28 to Aug. 28, 42 A.D.

Just before the beginning of the decade under review, Prof. B. W. Bacon, of Yale University, writing in *The Classical Weekly* (vol. vi, pp. 213–214), declared that "Until very recently no manuscripts of first-rate critical importance had come into American hands." Later, however, classical manuscripts of importance found a resting place in the Morgan Library in New York City. One of these, a fragment of a manuscript of Pliny's *Letters*, was decidedly in evidence in 1924. It had been bought by the late J. Pierpont Morgan in 1910. Dr. E. A. Lowe, a leading authority on classical palæography, and Prof. E. K. Rand, of Harvard University, published the fragment, in 1922, in a sumptuous monograph, well illustrated by plates, entitled *A Sixth-Century Fragment of the Letters of Pliny the Younger, A Study of Six Leaves of the Uncial Manuscript Preserved in the Pierpont Morgan Library in New York*. Dr. Lowe believes that the fragment is a genuine relic of antiquity, and that it was written in Italy, about 500. Professor Rand believes that it is a part of a codex used by Aldus Manutius, in the preparation of his printed edition of Pliny's *Letters*. This codex, the Codex Parisinus, is now lost. In his views of the fragment, and of Aldus's edition of Pliny, Professor Rand is in sharp collision with Prof. E. T. Merrill, of the University of Chicago, who, in 1922, published a critical edition of the text of Pliny's Letters. For reviews of the monograph by Messrs. Lowe and Rand see *The Classical Journal*, vol. xviii, pp 381–382; *Philologische Wochenschrift*, vol. xliii, pp 509–511; *American Journal of Philology*, vol. xlv, pp. 88–90; and *The Classical Review*, vol. xxxvii, pp. 139–140. Professor Merrill, in a paper entitled "The Morgan Fragment of Pliny's Letters," in *Classical Philology*, vol xviii, pp 97–119, takes issue with the views of Professor Rand. Professor Rand began an elaborate reply, in a paper entitled "A New Approach to the Text of Pliny's Letters, Article I," published in *Harvard Studies in Classical Philology*, vol. xxxiv, pp. 79–121 (1923).

On Dec. 19, 1906, Mr. Charles L. Freer, of Detroit, Mich., bought, of an Arab dealer in Gizeh, near Cairo, four Biblical manuscripts. These were carefully studied by Prof. H. A. Sanders, of the University of Michigan. The results appear in the following volumes: *Old Testament Manuscripts in the Freer Collection*, Part I, *The Washington Manuscript of Deuteronomy and Joshua; The New Testament Manuscripts in the Freer Collection*, Part I, *The Washington Manuscript of the Four Gospels; The Old Testament Manuscripts in the Freer Collection*, Part II, *The Washington Manuscript of the Psalms*. These volumes, published in 1910, 1912, and 1917, form parts of the *University of Michigan Studies, Humanistic Series*. For the importance of the manuscripts see *The Classical Weekly*, vol. vi, pp. 214.

In the field of palæography we must mention E. A. Lowe, *The Beneventan Script, A History of the South Italian Minuscule* (1914), a book which C. U. Clark, in a review in *American Journal of Philology* (vol. xxxv, pp. 340–343), described as "the most important recent palæographic investigation in any language." A book on a kindred subject which falls within the decade is H. B. Van Hoesen, *Roman Cursive Writing* (1915).

In the remainder of this article, it will be possible only to name a few of the more important contributions made by American classical scholars in Greek and Latin literature, Greek and Roman history, Greek and Roman life, linguistics, and grammar.

The late Prof. John Williams White, of Harvard University, undertook to make a collation of all Aristophanic manuscripts. One outcome of this study was a volume, of nearly 400 pages, *The Scholia on the Aves of Aristophanes, With an Introduction on the Origin, Development, Transmission, and Extant Sources of the Old Greek Commentary on his Comedies* (1914). For an elaborate review of this book, by G. E Howes, see *The Classical Weekly*, vol. x, pp. 90–95. As a preliminary to that volume, Professor White had published *The Verse of Greek Comedy* (1912), reviewed by M. W. Humphreys (*The Classical Weekly*, vol. ix, pp. 141–144). Professor White died in 1917. In *Harvard Studies in Classical Philology*, vols. xxix, xxx (1918, 1919) appeared two articles, "Collation of the Manuscripts of Aristophanes' *Aves*," and "Collation of the Manuscripts of Aristophanes' *Vespæ*," by J. W. White and E Cary

At least three American scholars won distinction during the decade by their articles on Homer—G. M. Bolling, of Ohio State University, S. E Bassett, of the University of Vermont, and J. A. Scott, of Northwestern University. Professor Scott published also a volume, *The Unity of Homer* (1921). On general progress in Homeric studies see *New International Year Book* for 1921, p. 558.

Mr. Paul Elmer More, formerly literary editor of *The Nation* (New York), published three volumes on Plato *Platonism* (1917), *The Religion of Plato* (1921), and *Hellenistic Philosophies* (1923)

Works more general in character are *Athenian Tragedy, A Study in Popular Art*, by T. D. *Goodell*, (1920); and *The Greek Theatre and Its Drama*, by R C Flickinger (in two editions, 1916, 1922). Professor Flickinger's book is of prime importance in its field; for a notice of it see *The Classical Weekly*, vol. xvii, p. 197.

Important was an annotated edition, the first published in the United States, of Cicero, *De Divinatione*, by A. S. Pease, published in the *University of Illinois Studies in Language and Literature*, vols. vi, viii (1920, 1923). Two biographies of Cicero by classical scholars appeared: *Cicero of Arpinum, A Political and Literary Biography, Being a Contribution to the History of Ancient Civilization and a Guide to the Study of Cicero's Writings*, E. G.

Sihler (1914); *Cicero, A Biography*, T. Peterson (1919).

Of great service to the student of Horace is *A Concordance to the Works of Horace*, L. Cooper (1916). Prof. G. C. Fiske in a volume entitled *Lucilius and Horace, A Study in the Classical Theory of Imitation* (1920), examined again the whole question of the relation of Horace to Lucilius, his predecessor in satire. Prof. W. A. Merrill published many studies on Lucretius, dealing with his versification, imitations of his expressions by Vergil and other poets, etc. In 1918 he issued an edition of the text of Lucretius, complete (see *New International Year Book* for 1918, p. 492). Prof. Kirby Flower Smith, of The Johns Hopkins University, edited, with introduction and notes, the *Elegies* of Tibullus.

To Vergil, scholars of all countries were giving much attention. In America, two biographies of Vergil appeared: *Vergil, A Biography*, by Tenney Frank, of The Johns Hopkins University, and *Virgil's Biographia Litteraria*, by Norman W. De Witt, University of Toronto (1923). Both authors assume that the poems of the so-called *Appendix Vergiliana* were all—or practically all—written by Vergil himself, in his youth, and that we may, therefore, confidently rely on them for important information concerning Vergil's earlier years. Both books abound with interesting and stimulating suggestions on individual points, but as wholes they are to be used only with great caution, especially since there was nothing like agreement, during the decade, among scholars concerning the authorship of the pieces in the *Appendix Vergiliana*. At the close of the last century few scholars believed in their Vergilian authorship. F. Skutsch, however, in his *Aus Virgils Fruhzeit* (1901, 1906), set the pendulum swinging, for a while, in the opposite direction. The tendency to accept one or more of the poems in the *Appendix* as Vergilian, as work of Vergil's youth, is seen in the following articles, or books: Miss E. S. Jackson, "The Authorship of the *Culex*," *The Classical Quarterly*, vol. v, pp. 163–174; Th. Birt, *Jugendverse und Heimatpoesie Vergils, Erklarung des Catalepton* (1910: for reviews, by N. W. De Witt and H. W. Prescott, see *American Journal of Philology*, vol. xxxii, pp. 448–458, *Classical Philology*, vol. v, pp. 381–382); J. W. Mackail, "Virgil and Virgilianism, A Study of the Minor Poems Attributed to Virgil," *The Classical Review*, vol xxii, pp. 65–73; W. G. D. Butcher, "The Cæsura in Virgil and its Bearing on the Authenticity of the Pseudo-Virgiliana," *The Classical Quarterly*, vol. viii, pp. 123–131; R. S. Conway, *The Youth of Vergil* (1915); J. S. Phillimore, "The Text of the *Culex*," *Classical Philology*, vol. v, pp. 418–439; T. Frank, "Vergil's Apprenticeship," *Classical Philology*, vol. xv, pp. 23–38, 103–119, 230–244; E. K. Rand, "Young Virgil's Poetry," *Harvard Studies in Classical Philology*, vol. xxx, pp 103–185 (1919); A. R. Bellinger, "Catullus and the *Ciris*," *Transactions of the American Philological Association*, vol. liii, pp. 73–82 (1923).

But, latterly, the views of those who would accept the pieces in the *Appendix* as Vergilian was sharply challenged. Especially suggestive here was the work of R. S. Radford: "The Juvenile Works of Ovid and the Spondaic Period of his Art," *Transactions of the American Philological Association*, vol. li, pp. 146–171 (1920); "The Priapeia and the Vergilian Appendix," *Transactions of the American Philological Association*, vol. lii, pp. 148–177 (1921); "Tibullus and Ovid," *American Journal of Philology*, vol. xliv, pp. 1–26, 230–250, 293–318 (1923). Professor Radford believes that the whole Vergilian Appendix is the youthful work of Ovid, "composed by him in the period extending from 27 to 8 B.C." In the *Transactions of the American Philological Association*, vol. liii, pp. 5–34 (1923), Prof. H. R. Fairclough, of Stanford University, in a paper entitled "The Poems of the *Appendix Vergiliana*," after study of the vocabulary of the poems in the *Appendix*, maintained that "probably not a single one of these poems has been correctly assigned to Vergil."

More general works in the field of Latin literature are E. G. Sihler, *From Augustus to Augustine, Essays and Studies Dealing with the Contact and Conflict of Classic Paganism and Christianity* (1923), and E T. Merrill, *Essays in Early Christian History* (1924).

In the field of Greek history we may note, first, G. W. Botsford and E. G. Sihler, *Hellenic Civilization* (see *New International Year Book* for 1915, p. 497). C. W. Blegen wrote *Korakou, A Prehistoric Settlement Near Corinth* (1921), published by the American School of Classical Studies at Athens. The civilization unearthed by excavations at Korakou, a hillock 3 kilometers west of the site of ancient Corinth, is of the type known as "Helladic," a term (see under ARCHÆOLOGY) devised to distinguish the prehistoric civilization of the Greek mainland from the prehistoric civilization found in the Cyclades Islands ("Cycladic") and in Crete ("Minoan"). Mr. Blegen's book deals with remains dating from 2500 to 1100 B.C. Important, too, is M. Rostovtzeff, *Iranians and Greeks in South Russia* (1922).

Works on Roman history are the following: A. E. R Boak, *A History of Rome to 565 A.D.* (1921); T. Frank, *Roman Imperialism* (1914), *An Economic History of Rome to the End of the Republic* (1920), and *A History of Rome* (1923); T. S. Jerome, *Aspects of the Study of Roman History* (1923); G. Showerman, *Eternal Rome, The City and Its People From the Earliest Times to the Present Day* (1924).

In the field of Greek and Roman life we can mention only W. S. Fox, *The Mythology of the Greeks and Romans* (1916); W. C. Greene, *The Achievement of Greece* (1923); W. W. Hyde, *Olympic Victor Monuments and Greek Athletic Art* (1921), reviewed by G. H Chase, *The Classical Journal*, vol. xix, pp. 119–120, and D. M. Robinson, *The Classical Weekly*, vol. xvii, pp. 59–62; C. H. Moore, *The Religious Thought of the Greeks* (1916), and *Pagan Ideas of Immortality During the Early Roman Empire* (1918); E. Tavenner, *Studies in Magic From Latin Literature* (1916); L. Van Hook, *Greek Life and Thought* (1923).

In the field of Greek grammar, we name two important books, by H. W. Smyth, of Harvard University: *A Greek Grammar for Schools and Colleges* (1916), and *A Greek Grammar for Colleges* (1920). The latter book is worthy of a place beside the *Greek Grammar* of W. W. Goodwin, long the favorite Greek grammar of Greek scholars and teachers in the United States and in England. Of prime authority in its field is A. T. Robertson, *A Grammar of the Greek New Testament in the Light of Histor-*

ical Research (1914—there is a second, revised edition).

In the field of Latin grammar quite the most impressive achievement in America between 1900 and 1924 was the work of Prof. C. E. Bennett, *The Syntax of Early Latin:* Volume I, *The Verb* (1910), Volume II, *The Cases* (1914). This work completely supersedes all previous discussions of the syntax of early Latin. For reviews, by C. Knapp, see *American Journal of Philology*, vol. xxxii, pp. 333–343; vol. xxxv, pp. 268–293.

In linguistics three American scholars are doing excellent work—L. Bloomfield, R. G. Kent, and E. H. Sturtevant. The work of Professor Kent is to be found in the periodicals, especially in the *Transactions of the American Philological Association*. Professor Bloomfield published also a book, *An Introduction to the Study of Language* (1914). Professor Sturtevant issued two books: *Linguistic Change* (1917), and *The Pronunciation of Greek and Latin, The Sounds and Accents* (1920).

In lexicography, foremost was the monumental *Lexicon Plautinum*, by Prof. G. Lodge, of Columbia University, which had been in course of publication since 1901. Nine parts, totaling 864 large pages, and carrying the *Lexicon* into *Ita*, had been issued. Prof. M. N. Wetmore, of Williams College, published two important works, *Index Verborum Vergilianus* (1911) and *Index Verborum Catullianus* (1912); for reviews see *The Classical Weekly*, vol. vi, pp. 101-103, 109–111, 124. Professors W. A. Oldfather, A. S. Pease, and H. V. Canter, of the University of Illinois, published "Index Verborum Quae in Senecae Fabulis Necnon in Octavia Praetexta Reperiuntur," in *University of Illinois Studies in Language and Literature*, vol. iv (1918). Professors A. A. Howard and C. N. Jackson, of Harvard University, published *Index Verborum C. Suetoni Tranquilli Stilique Proprietatum Nonnullarum* (1922).

PHILOLOGY, MODERN. In making this brief sketch of the progress of philology during the 10 years 1914–1924, it behooves us to stress first of all the salient tendencies characterized by the vast volume of production in this ever-growing field of research. Thereafter the most important languages as viewed from the vantage point of intensity and originality of investigation—will claim our attention. To attempt to go further into detail is well-nigh impossible considering the space limitations. There shall even be no endeavor to list all the chief contributions made during this period, for such a classification would perforce be tentative and subject to the criticism of divergent opinion. The most carefully developed criteria often fail to be conclusive. It is necessary, therefore, that the selection be limited to such works as indicate the directions in which investigations are being carried on.

The War, which interrupted the period to which we are to devote our attention, had, from the philological point of view, two important consequences. On the one hand, it served to check, though not entirely, the outworn methods of investigation which had attained the zenith of their effectiveness before the close of the nineteenth century; while on the other, it made obvious to students of philology the vast possibilities that lay within their reach.

Already in 1914 it was noted in the pages of the *New International Year Book* that the study of philology was undergoing a process of transformation. The self-styled "Back to Nature" school founded in the early nineties by German scholars under the leadership of Schuchardt, a profound though not very original scholar, believed they could arrive at general laws, applicable to all possible cases, by means of the study of dialects. Their preferred method, so aptly designated *Sprachmischung*, or the mutual penetration of dialects, failed to satisfy expectations, because of the numerous historical factors and variable accessory circumstances which must always be taken into consideration. The new French school, with the equally profound and more brilliant Meillet at its head, hastened to reject entirely the esoteric philology which isolates linguistic facts from all contact with life, and began to interpret linguistics by the social movements of civilization—in a word, to seek in the development of languages the result of political and social actions. While the War retarded development of research along these lines by diverting the attention of the disciples of the French scholar into channels of a military nature, it served, however, to prove the truth of his contentions.

The year 1915 was most discouraging for philologists. Because of its appalling losses it was feared by some that the movement initiated by Meillet was destined to undergo entire arrestment of development. Notwithstanding the gloomy outlook, it was generally felt that, though retarded for the time being, the revolution—for such it has proved to be—would take place.

Toward the close of the year 1915, there appeared the two-volume epitome entitled *La Science Française*, the genesis of which was due to the initiative of the founders of the library of French thought at the International Exposition at San Francisco. In the second volume is to be found the very suggestive survey of linguistics (*La Linguistique*) by Antoine Meillet. According to this philologist, French scholars, although they entered this field of research long after the ground had been broken by the Germans, realized at once its possibilities. Notwithstanding that there have been numerous German schools of philology, there has never been a French school for the mere reason that *savants* of that nationality have always drawn their conclusions from data, and have refrained from accepting any theory that was not entirely in harmony with facts. At the outset, French philologists sought to approach the subject from every angle in order to bring all possible light to bear upon it. It is this above all which has led to the introduction of new fields of investigation, such as semantics, dialectology, phonetics and kindred subjects. The outcome of these methods was not only the monumental *Atlas Linguistique de la France* of Gilliéron and Edmont, of which, according to the eminent critic Gaston Paris, French scholarship may well be proud, the *Sémantique* of Bréal, in which are laid the foundations of the science of the development of meanings of words, and the *Dissimilation Consonantique* of Grammont, a work so original that we have not yet grasped its full significance; but also the *Histoire de la Langue Française* of Brunot which, says M. Jeanroy, has no equivalent in any other country, the great impulse given to experimental phonetics by the researches of Abbé Rousselot and others, the development along characteristic lines of

the school of Celtic philology, and finally, the rehabilitation of the spoken language made by Meillet himself in his suggestive contributions to the study of Armenian, Slavic and Greek. It is thus not so much by *des recherches de détail* (which, however, have their importance), as by the *introduction de vues neuves et de directions originales* that comparative philology has received new vigor from French thought.

Following the lead of Meillet, one of the editors of the monumental *Atlas Linguistique de la France*, J. Gilliéron, published at Neuveville, Switzerland, a series of lectures entitled *La Faillite de l'Etymologie Phonétique* in which he opened the attack from a new quarter. As the title indicates, the learned author admits the inadequacy of the methods in vogue, notwithstanding the yeoman service they may have rendered in the past, to cope with present-day problems. The mere fact that such a question is posed frankly and fearlessly by scholars of the rank of Gilliéron shows that philologists are alive to the new demands made upon them.

The most striking feature of the year 1921 was the great revival of interest in the study of language and its attendant problems. It seems that many Europeans have sought solace from the disillusionments of war in the inspiration furnished by President Wilson's cherished theory of self-determination according to linguistic and racial unity. This has been a most vital and stirring problem with all of these peoples more or less from almost time immemorial.

Encouraged no doubt by this general tendency, M. Meillet returned to the investigation of fundamental problems of comparative linguistics. In a volume of essays entitled *Linguistique Historique et Linguistique Générale*, published in 1921, this scholar laid definitively the basic principles for the reconstitution of the methodology of this subject. In his opinion, all languages show common tendencies, determined, on the one hand, by the structure of the vocal organs and the limited number of phonetic possibilities that they offer, and, on the other, by the laws of general psychology. These tendencies are obvious in such universal changes as the weakening of intervocalic consonants, vowel-breaking, or in the normalization of paradigms through the principle of analogy. "Le changement linguistique," says M. Meillet, "est lié à des faits de civilisation et à l'état des sociétés qui emploient les langues considérées." In so far as it is a means of communication between the members of a same clan or of a same nation, language tends either to become infinitely differentiated or to fuse its divergent dialects into a common speech, according to the inclination to division or unification of the groups or peoples that speak it The progress of language is inseparably bound up with the progress of society.

It is thus in extending our grasp of the great problem of linguistics that we are approaching more closely an understanding of the race as well as the individual. However imperfect language may be as an expression of our thought, it is nevertheless the sole means in our possession. It serves therefore in its limited way to reveal our mental attitude. As stated above, M. Meillet is thus leading philology from the arid domain of phonetic formulas into the very fertile, though most intricate, field of human life. Henceforth the term philology will signify much more than a mere juggling with forms: it is rather, to use the words of H. C. Wyld in his address on *English Philology in English Universities* (Oxford, 1921) "the study of human speech modified, altered, enriched at every stage by influences both literary and historical."

If we now turn to a more specific aspect of linguistics, i.e. grammar, we find that the same conditions obtain. In 1914, we noted that in regard to grammar there was a reaction against the study of the history of languages in favor of the general principles of the theory of language. O. Jespersen's *Modern English Grammar on Historical Principles* (Heidelberg, 1914) represents to a certain extent an effort to revive the teaching of grammar which, it may be said, had only slightly shown the effects of the progress of linguistics during the course of the century just passed.

It was while making efforts to broaden and improve their methods in accordance with modern scientific research that scholars became aware that, with the possible exception of philosophy, theology and medicine, the study of language was hemmed in and impeded on all sides by tradition and intolerance. From the more or less remote past we have inherited a rigid methodology applicable to dead synthetic languages but totally inadequate to solve the problem of the living analytic tongues and their relationship with a dynamic life teeming with new ideas. But, as history should teach us, there is no compromise with intolerance and tradition: and just as science was obliged to engage in open warfare with theology, so modern philology is entering the lists against its most redoubted and firmly entrenched opponent, which is our antiquated, though universally accepted, conception of grammar and its laws.

Consequently, *La Pensée et la Langue* (Paris, 1922), the stimulating volume by Ferdinand Brunot, the distinguished dean of the University of Paris, is in many respects an epoch-making work. Bearing as a sub-title *Méthode, principes et plan d'une théorie nouvelle du langage appliqué au français*, this manifesto by an author widely known for his monumental history of the French language mentioned above, purports to be a "methodical statement of facts derived from thought and interpreted and classified in its relation to language, and of the means of expression corresponding to them." After showing how every innovation in linguistic methodology has sooner or later been thwarted by a mediæval heritage of grammatical concepts and nomenclature—even comparative philology was obliged to surrender many of its revolutionary doctrines when confronted by a glowering and tyrannical tradition—M. Brunot observes that, thanks to the efforts of our "grammatical commissioners of police," the teaching of language to-day—like theology—is "a drudgery, the pet aversion of both pupils and teachers." Not even does orthographical reform escape the inquisition. And he passes in review many gross blunders that the high priests of grammar dole out to the young as established facts, such as a tense which they interpret as a mood, a future-perfect which has been disguised as a conditional, theories built upon misconstructions, etc. He adds, therefore, that it is high time to prepare a *Manual of Wrong Rules* as a pedagogical breviary which should protect the young against the "fundamentalism" of misguided

dogmatists. And therefore the object of M. Brunot's work is "the practical study of grammar with a view to enable the student to understand and express everything."

As a consequence of the rapid development of the cinematograph, the aëroplane and the radiophone, which are rendering geographical boundary an anachronism and are ameliorating international communication and, therefore, international good will, more widespread attention is rightly being devoted to comparative philology. Though only a century old, its influence in the cause of international understanding has been far-reaching. In past ages each country had the utmost contempt for foreigners unable to speak its tongue. To the ancient Hindus they were *mlecchas* (Prakrit *milicchu*, Pāli *milakkhu*, barbarian), 'incomprehensibles'; to the Jews, *gojim*, infidels'; to the Arabs *adscham*, 'babblers'; to the Turks *giaours* (Turkish *jawr*, *gawur* < Persian, *gaur*, 'infidel,' another form of *gabr*, 'infidels,' 'Gueber'), 'unbelievers,' 'miscreants'; to the Greeks *barbarophonoi* or *barbaroi*, 'stammerers,' and later 'uncultured' or 'barbarians' Even to-day the French *charabia* 'gibberish' (Spanish *alg-arabia*, the 'Arabic language'), or *baragouin*, 'jargon' (Breton *bara*, 'bread,' and *gouin* 'wine,' offered to the French invaders of Brittany), or the Mexican *gringo* (Spanish *griego*, 'Greek'), applied especially to the inhabitants of the United States, or the North American *wop* (Spanish *guapo*, 'handsome'), or *dago* (Spanish-Portuguese *Diego*, 'James,' a term of address) have all now assumed a pejorative connotation and betoken the same spirit of contempt for the foreigner But when comparative philology began to reveal that the so-called Indo-European languages were offshoots of the same parent stock, the alien tongue was no longer despised as the product of an inferior mind The finest compliments ever paid to a somewhat abstruse subject of research were the numerous efforts during the War to explain acts of aggression as a moral obligation to preserve continuity or relationship of speech.

Some one has suggested that the present period of the world's history will be designated in future times as the "dictionary epoch." In fact, never has such interest been shown in living foreign tongues. The vast number of dictionaries or vocabularies—of which a few titles have been noted in the pages of the *New International Year Book* in the 10 years furnishes a striking testimony to the desire of most nations to avoid cultural or commercial isolation. Likewise, the study of phonetics, which during the first half of its 40 years of history passed almost unnoticed, is now, as noted above, arousing widespread interest, especially because of the assistance it affords in pronouncing accurately a foreign tongue. In response to this great demand on the part of our public, several of our largest educational institutions are offering courses in this subject as well as opportunities for research And it may be added that the 10 distinguished foreign scholars, representing France, Spain and Italy, who lectured or taught in Columbia University in the summer of 1923. stressed the culture, civilization and language of their respective countries. A final indication of the awakening of the spirit of international fraternization may be gathered from the almost universal recognition of the need of a universal tongue. Since the decline of Latin in the seventeenth century, all efforts to create a substitute have been decried as the work of impractical idealists. But that these dreamers are now being taken seriously is obvious from an editorial in the *New York World* of Dec. 26, 1923, which affirms the necessity of a "radio language." In the spring of 1923 a movement to revive Esperanto as an international language was begun by a committee headed by Mrs. Dave Morris of New York; and their efforts are already bearing fruit, for many of our educational institutions, notably Columbia University, have now included Esperanto in their curricula of studies. See INTERNATIONAL LANGUAGE.

Bibliography. For further information see the series of articles entitled "Philology, Modern," appearing in the *New International Year Book* from 1910 on. Inspired, no doubt, by the example set by the *New International Year Book*, a number of British scholars began to issue in 1920 a *Year Book of Modern Languages* which contains extensive data.

General. F. de Saussure, *Cours de Linguistique Générale*, edited by Bally and Séchehaye (Paris, 1916–23); C. S. R. Collin, *Bibliographical Guide to Sematology* (Lund, 1915); A. Werner, *The Language-Families of Africa* (London, 1917); H. Schuchardt, *Sprachverwandtschaft* (Berlin, 1917); L. Dominian, *Frontiers of Language and Nationality in Europe* (New York, 1918); A. Meillet, *Les Langues dans l'Europe Nouvelle* (Paris, 1918); A. Aarne, *Vergleichende Rätselforschungen* (Helsingfors, 1918); H. Miller, *Die semitischvorindogermanischen Laryngalen Konsonanten* (Copenhagen, 1917); Abbé P. T. Mainage, *Les Religions de la Préhistoire* (Paris, 1920); H Schuchardt, *Sprachursprung* (Berlin, Pt. II, 1920); J. de Morgan, *L'Humanité Préhistorique* (Paris, 1921); J. Marouzeau, *La Linguistique ou Science du Langage* (ib.); E. Sapir, *Language* (New York, 1921); O. Jespersen, *Language, Its Nature, Development and Origin* (London, 1922); J. Vendryès, *Le Langage* (Paris, 1922); A. Dauzat, *La Géographie Linguistique* (ib., 1922); W. M. Thomas, *Language in the Making* (New York, 1923); E. W. Hopkins, *Origin and Evolution of Religion* (New Haven, 1923).

Indo-European. Works on the language of the primitive Indo-Europeans are devoted mainly to phonology and morphology. Among the more important are: H. Hirt, *Fragen des Vokalismus und der Stammbildung im Indogermanischen* (Strasbourg, 1914); K. Brugmann and B. Delbrück, *Grundriss der vergleichenden Grammatik der Indogermanischen Sprachen* (2d ed., 1916, Strasbourg); O. Schrader, *Reallexikon der Indogermanischen Altertumskunde* (2d ed, ib., 1917–); H. Güntert, *Indogermanische Ablautprobleme* (ib., 1916); W. Streitberg, *Erforschung der Indogermanischchen Sprachen* (Strasbourg, 1916); S. Feist, *Indogermanen und Germanen* (2d ed., Halle, 1919); C. Bartholomae, *Zur Etymologie und Wortbildung der Indogermanischen Sprachen* (Heidelberg, 1919); H. Hirt, *Indogermanische Grammatik* (Pt. II, Heidelberg, 1921); H. H Bender, *The Home of the Indo-Europeans* (Princeton, 1922); A Meillet, *Les Origines Indo-Européennes des Mètres Grecs* (Paris, 1923).

Indo-Iranian. Contributions to this field were less numerous. They consist principally of translations and grammatical and syntactical studies of texts. Somewhat out of the ordinary

are: Jouveau-Dubreuil, *Archéologie du Sud de l'Inde* (2 vols., Paris, 1914); Gauthiot, *Essai de Grammaire Sogdienne (Groupe Iranique)* (ib.); A. V. W. Jackson, *Catalogue of Persian MSS. Presented to the Metropolitan Museum of Art by A. S. Cochran* (New York, 1914); C. Bartholomae, *Zur Kenntnis der Mitteliranischen Mundarten* (Heidelberg, 1917); H. Oldenberg, *Zur Geschichte der Altindischen Prosa* (Berlin, 1917); and Sir G. A. Grierson, *Linguistic Survey of India* (vol. x, Calcutta, 1921) containing specimens of languages of the Iranian family.

Slavic. Among the numerous contributions, we may note Berneker, *Slavisches Etymologisches Worterbuch* (vol. i, A-L, Heidelberg, 1908–13); Vondrák, *Altkirchenslavische Grammatik* (2d ed., Berlin, 1914); J. Herzer, *Böhmisch-deutsches Wörterbuch* (Prague); R J. Kerner, *Slavic Europe* (Cambridge, Mass., 1918), a bibliography; H. H. Bender, *Lithuanian Etymological Index* (Princeton, 1922); L. Niéderlé, *Manuel de l'Antiquité Slave* (vol. i, Paris, 1923). Other studies include Slovenian, Ruthenian-Ukrainian, Russian, Czech (see *Year Book*, 1916, 1918, 1919; Baltic (1915, p. 499; 1920, p. 537; 1922, p. 563); Serbo-Croatian (1918, p. 495; 1915, p. 499); Serbian (1916, p. 537); Polish (1918, p. 495, 1916, p. 537); Ukrainian (1917, p. 537; 1918, p. 495); Lithuanian (1918, p. 495; 1920, p. 537; 1922, p. 563); Old Prussian (1918); Bulgarian (1919).

Celtic. Studies in Irish, Manx, Scotch, Welsh, Cornish and Breton as well as Gaulish and Pre-Celtic have appeared more or less every year. Among the more important are: C. Jullian, *Histoire de la Gaule* (4th vol., Paris, 1914); G. Dottin, *Manuel pour Servir à l'Etude de l'Antiquité Celtique* (Paris, 1915); John Strachan and J. G. O'Keeffe's edition of the *Táin Bó Cuálnge* (Dublin, 1916); *Catalogue of the Bradshaw Collection of Irish Books in the University Library of Cambridge*, 3 vols. (1916); K. Meyer, *Zur Keltischen Wortkunde* (Berlin, 1917–19); E. Cartailhac, *Dictionnaire Archéologique de la Gaule* (vol. ii, Paris, 1919); G. Dottin, *La Langue Gauloise* (ib., 1920); J. Loth, *Remarques et Additions à la Grammaire Galloise Historique et Comparée de John Morris Jones* (Paris, 1920); E. Le Blant, *Inscriptions Chrétiennes de la Gaule* (2 vols., Paris, 1923); J. D. Bruce, *The Evolution of Arthurian Romance from the Beginnings Down to the Year 1300* (Baltimore, 1923).

Germanics. Contributions to the Germanic languages are so numerous that it would be vain to list even the more important. The reader is referred therefore to various editions of the *New International Year Book*. Under the same general heading will also be found works in Frisian, Gothic, etc. Among these contributions are: J. Hoops, *Reallexikon der Germanischen Altertumskunde* (Berlin, 1915–19); Grimm's *Deutsches Worterbuch* (Leipzig); H. Fischer, *Schwabisches Wörterbuch* (Tübingen); *Jellinghaus-Förstemann, Altdeutsches Namenbuch* (Bonn); the *Schweizerisches Idiotikon, Worterbuch der Schweizer-deutschen Sprache* (Frauenfeld); J. Zupitza, *Einfuhrung in das Studium des Mittlehochdeutschen* (Chemnitz, 1916); J. Schatz, *Altbairische Grammatik* (Göttingen, 1915); A. Meillet, *Caractères Généraux des Langues Germaniques* (Paris, 1917); B. Delbrück, *Germanische Syntax* (Leipzig, 1916–19); H. Paul, *Deutsche Grammatik* (2 vols., Halle, 1916–17); E. Sievers, *Metrische Studien* (Leipzig, 1919); S. Feist, *Etymologisches Wörterbuch der Gotischen Sprache* (Halle, 1920); H. Hirt, *Geschichte der Deutschen Sprache* (Munich, 1919); H. Paul, *Deutsche Grammatik* (vols. iii, v, Halle, 1920); F. Kluge, *Deutsche Sprachgeschichte* (Leipzig, 1921); F. A. Wood, *Verner's Law in Gothic* (Chicago, 1922); E. Steinmayer and E. Sievers, *Die Althochdeutsche Glossen* (vol v, Berlin, 1922); O. Behaghel, *Deutsche Syntax* (Heidelberg, 1923); and A. Pinloche, *Etymologisches Worterbuch der Deutschen Sprache* (Paris, 1923).

Scandinavian. This group of indefatigable scholars made valuable contributions to Old Norse, Icelandic, Swedish, Danish, Norwegian, etc, such as the Swedish Academy's *Ordbok Öfver Svenska Sprâket* (Lund); Egilsson and Jónsson, *Lexicon Poeticum Antiquae Linguae Septentrionalis: Ordbog over det Nordisk-islandske Skjaldesprog* (Copenhagen); A. Torp, *Nynorsk Etymologisk Ordbok* (Christiania); Noreen, *Vart Sprak* (Lund); Klara Stroebe, *Nordische Volksmarchen*, edited by F. von der Leyen and P. Zaunert (2 vols., Jena, 1915); W. A. Craigie, *The Icelandic Sagas* (New York, 1915); *Diplomatarium Islandicum* (1310–1544) (Reykjavik, 1916); A. Kock, *Svensk Ljudhistoria* (vol. iv, Lund, 1920); O. Oestergren, *Nusvensk Ordbok* (Stockholm); E. Hellquist, *Svensk Etymologisk Ordbok* (Pt I, Lund, 1920); H. Hermannson, *Bibliography of the Eddas* (Ithaca, 1920); V. Dahlerup, *Det Danske Sprogs Historie* (Copenhagen, 1921); J. Jakobsen, *Etymologisk Ordbok over det Norrone Sprog pa Shetland* (4 vols., Copenhagen, 1908–21); V. Dahlerup, *Ordbog over det Danske Sprog* (vol. iii, Copenhagen, 1922); E. Sievers, *Die Edda Lieder* (Leipzig, 1923).

English. As no selected list of works could do justice to such an extensive collection, we will limit our attention to Dr. Murray's *New English Dictionary* (Oxford); H. Harrison, *Surnames of the United Kingdom* (London); *Crabbe's English Synonyms* (Anniversary edition, New York, 1917); H. L. Mencken, *The American Language* (New York, 1919); P. G. Thomas, *Introduction to the History of the English language* (London, 1920); R. W Chambers, *Introduction to the Study of Beowulf* (ib., 1920); H. C. Wyld, *History of Modern Colloquial English* (ib., 1920); K. Luick, *Historische Grammatik der englischen Sprache* (Leipzig); E. Weekley, *Etymological Dictionary of Modern English* (London, 1921); T. N. Toller, *Anglo-Saxon Dictionary* (Oxford, 1922); R. Huchon, *Histoire de la langue anglaise* (Paris, 1923).

Romance. The continued activity of scholars in this domain bespeaks the immense wealth of material at the disposal of the philologist. Incessant publication of new texts has had as a consequence reorganization of material and revision of methods. As examples may be cited Meyer-Lübke's *Romanisches Etymologisches Wörterbuch* (Heidelberg); Bédier's celebrated *Légendes épiques* (Paris, 2d ed., 1922) of which the first edition was completed in 1913. Other works are G. Nicholson, *Recherches Etymologiques Romanes* (Paris, 1921); E. Bourciez, *Elément de Linguistique Romane* (ib. 1923); G. Millardet, *Linguistique et Dialectologie Romanes* (ib., 1923).

French. K. Nyrop, *Grammaire Historique de la Langue Française* (3d ed., Copenhagen); A. Tobler, *Altfranzösisches Wörterbuch*, edited

by E. Lommatzsch (Berlin); A. Haase, *Syntaxe Française du Dix-septième Siècle* (trans. by M. Obert, Paris, 1916); F. Brunot, *Histoire de la Langue Française des Origines à 1900* (vol. v, Paris, 1917); K. Vossler, *Französische Philologie* (Gotha, 1919); L. Gauchet and J. Jeanjaquet, *Glossaire des Patois de la Suisse Romane* (vol. ii, 1920); J. Gilliéron, *Etude de Géographie Linguistique* and supplement to vol. i of the *Atlas Linguistique de la France* (Paris, 1921); A. Longnon, *Les Noms de Lieux de la France* (Paris, 1920–22); G. Ertiger, *Französische Synonymik* (Dresden, 1922); P. Barbier, *English Influence in the French Vocabulary* (New York, 1922); W. von Wartburg, *Franzosisches Etymologisches Wörterbuch* (Bonn, 1922); J. Vising, *Anglo-Norman Language and Literature* (Oxford, 1923); P. Désormaux, *Bibliographie Méthodique des Parlers de Savoie* (Paris, 1923).

Italian Diatechology and lexicography have held the attention of Italian scholars. Among these works are G. Bertoni, *Italia Dialettale* (Milan, 1916); E. Monaci, *Studi Romanzi* (Rome, 1917); V. Restori, *Dal Latino Plebeo all' Italiano Illustre* (Mantua, 1923); L. Spitzer, *Italienische Umgangsprache* (Bonn, 1922); and G. Saccà, *La Lingua Italiana e la sua Evoluzione* (Catania, 1923).

Spanish. The numerous dialects spoken over the vast territory once forming the colonial possessions of Spain afford an inexhaustible subject for the philologist. Among the contributions are the 14th edition of the *Diccionario de la Lengua Castellana*, by the Spanish Royal Academy (Madrid, 1914); *Diccionario Gallego-Castellana* by the Royal Galician Academy (Coruña); A. Castro and F. de Onis, *Fueros Leoneses* (Madrid, 1916); Spanish Royal Academy's *Gramática de la Lengua Castellana* (new edition, Madrid, 1917); M. A. Roman, *Diccionario de Chilenismos y de Otras Locuciones Viciosas* (5th vol., Santiago de Chile, 1916–18); R. Foulché-Delbosc and L. Barreau Dihigo, *Manuel de l'Hispanisant* (vol. i, New York, 1920); A. Zauner, *Altspanisches Elementarbuch* (Heidelberg, 1921); and R. Menéndez Pidal, *Documentos Linguisticos de España* (Madrid, 1923).

Dictionaries, etc As we have noted heretofore, because of the numerous languages involved in the War, public attention became focused on language study. However, to meet the immediate emergency a vast number of dictionaries, language manuals, and phrase books were published containing vocabularies not only of the numerous sciences drafted into the War, but also for commercial intercourse and even social amenities. During the War an attempt was made by the writer to supply a fairly complete list of such manuals and dictionaries. Space limitations make it impossible of repetition here. The reader is therefore referred to the following editions of the *New International Year Book:* 1915, p. 502; 1916, pp. 537–540; 1917, pp. 536–537; 1918, pp. 494–497; 1919, p. 522; 1920, p. 539, etc. Likewise for the interest developed in the courses conducted in many American universities and colleges for prospective officers enrolled in the Students' Army Training Corps, see the *New International Year Book* for 1918 (pp. 495–496).

PHILOSOPHY. The developments of greatest philosophical significance in the field of natural science were incidental to the attempt of the scientists to find a way of passing from one supposedly discreet science to another. The attempt to bridge the gulf between mathematics and physics issued in the theory of relativity; similarly the attempted transition from physics to chemistry resulted in the statement of the problem of the structure of the atom and the quantum theory as a tentative answer. Less was done to articulate biology with its forerunning sciences because the questions in that region are still manifold, but the controversy over vitalism and mechanism and the investigation of colloidal substances is significant. Psychology, at least in the English-speaking world, was in great danger of being subsumed under the other sciences such as physics, biology and physiology, rather than being recognized as sufficiently independent to warrant the assignment of a special place and function in the scientific field. However, if we recognize the psychologist's hope of differentiating psychology proper, social psychology and the psychology of society and sociology, we could make a fairly complete picture of the intellectual market place of 1924—a picture which would gratify a follower of Comte at any rate.

However, this tendency to integrate the sciences did not exactly follow the lines of development laid down by Comte. Neo-positivism accounted for scientific thought in terms of mathematical correlation. Its chief spokesman reduced scientific hypothesis to the level of mathematical equation; the entity hypothesis was excluded as far as possible; the terms in these equations were merely convenient expressions substituted for observations and thus made amenable to mathematical treatment. This intellectual asceticism was justified by the facility it contributed to the scientific treatment of experience. It also enabled the scientist to appeal to mathematical presuppositions instead of outworn metaphysics when he was hard pressed to give some further account of his theories.

This need for interpretation, especially with regard to scientific formulas which involve non-Euclidean geometry, led to the further development of postulate theory and mathematical logic. So when, in 1919, it appeared that at least one of Einstein's predictions, which were based largely on non-Euclidean geometry and rather unconventional postulates, had been verified, greater importance was attached to the work of Peano, Frege, Cantor, Dedekind, Whitehead and Russell in mathematical theory. Here was observational evidence not only for Einstein's theory of relativity, but a naïve philosophical mind was tempted to conclude that the mathematical presuppositions were also verified. Some not so well trained in mathematical theory were tempted to claim verification for their own special brand of metaphysics on the same ground. The discovery of the displacement of Mercury at perihelion was like Thales' discovery of the marvelous uses of the waters of the Nile and the subsequent founding of the Ionian school of nature philosophies: water, fluid, ice, steam, mathematics, non-Euclidean geometry, postulates, mathematical logic. We now had a scientific method in philosophy.

The more cautiously minded mathematicians and scientists disowned any such extrapolation, and rejoiced over the great advantages afforded by the theory of relativity for scientific method. The more philosophically minded saw the problem of rendering such an enormous system in-

telligible not so much for science as for human culture. Whitehead resolved to recast the fundamentals of physics to fit in with the new theory, and for this found his method of extensional abstraction most convenient. Cassirer, a neo-Kantian, took the opportunity to show how the Platonic element in the Kantian *a priori* had in it the capacity to assimilate the new mathematical physics and thus discharge the obligation to be intelligible, which science had neglected to fulfill. Brunschvieg found it possible to go still further and link up the Spinozistic tradition of intellectual intuition or judgment with the equally Spinozistic "world of numbers" presented by Einstein. Out of this approach there results an onward march of man, the author of science.

Running along beside these theories of relativity, which are concerned mainly with the application of mathematics to astronomical physics, were the investigations of the structure of the atom, which use other and apparently divergent mathematical hypotheses. Here again the naïve mind found a springboard for metaphysics, and the cautious critical mind contented itself with mathematical correlations. The philosophical significance seems to lie in the field of epistemology rather than in logical theory as in the case of relativity. Philosophers of physics like Broad attempted to include and articulate the psychology of perception processes with physical action, while G. E. Moore supplied a Platonic metaphysics to support it.

The other natural sciences present problems like these, though less clearly formulated. The best scientific mind uses imagination and mathematics, the best philosophical mind criticizes and sets the results in consistent order, and this is fortunate for science. But it should be remembered that this is science, with philosophy as handmaiden. The scientist discovers and classifies, calling for philosophical criticism only to render his material intelligible, when no further progress can be made without such insight. Insight or wisdom performing this function is intellect domesticated or enslaved; mathematics and logistics take the place of logic; ethics, æsthetics, and metaphysics are ignored. Yet one sees in this commandeering of the philosophic insight and intuition the start of a return to the greater tradition in philosophy. The reference of scientific findings to an intellectually grasped or constructed system is not a new trick. One remembers that Plato found a function for hypothesis in his ascent to the ideas. Also, one must not forget that the modern procedure is not accidentally Platonic. The earlier Russell did not despise Platonism, and the latest Santayana embraces it with true æsthetic enthusiasm. What matters it that system or essence is substituted for the idea? Cassirer is not frightened by the dialectic Nemesis that follows.

The rivals to this positivistic naturalism are the modern humanists. One would like here to review the so-called realistic and psychological novel and compare it with the Greek tragedy as the objectification of opinions on fundamentally philosophical themes. Or, on another level one might sift behavioristic and Freudian psychology for nuggets of wisdom, but here again we find the professional philosopher buying and using the novelist's and scientist's knowledge. The rationale of his doctrines is the biologist's or the sociologist's dogmas. The most obvious illustration of this is the pragmatic tradition in America. James, Freud, and Watson have sold their functional psychologies to both the professionals and the guildsmen of humanistic sciences. Their psychologies are ultimately physiological, biological, or sociological, and the philosophizing which one finds is the reference of this or that particular fact to one of these systems. Humanism means then that man the organism, man the psyche, man the citizen of a commonwealth is the measure of all things. Glands, unit characteristics, instincts, conditioned responses, complexes, survival value, adaptation, social expediency are terms to conjure with. They are the inner fates and Nemesis of our human existence Yet the relativism of these concepts is admitted in the writings of Dewey, Pound and McDougall. Man's creative intelligence measures, and moves on.

In France, Durkheim and Lévy-Bruhl and in England Westermarck and Hobhouse set up the science of anthropology as a system of reference. Æsthetics, logic, ethics, all have a genesis and *raison d'être* in man's social experience. *Mores*, taboos, and ritual supply the necessity of man's life and knowledge. But there was a more sophisticated European tradition which had not only appropriated but assimilated the concepts of biology and anthropology. It not only avoided but condemned what it called psychologism. It reduced scientific classification and subordination to the level of arbitrarily specialized categories, and asserted the superiority and finality of the intuitive comprehension of experience. It drew upon Spinoza, Kant, and Hegel. It placed the æsthetic at the foundation of knowledge and the ethical at the top and demanded the integration of this or that bit of knowledge in the light of the immediately given whole. However, that it paid for its sophistication is evident from the difficulties it encountered. More often than not an attempt was made to characterize its ultimates in terms of its most hated scientific discreetness. Bergson never escaped the biologism of his *élan vital;* Croce fell into the Hegelian fiasco of identifying spirit with human history; Brunschvieg fell short of Spinozistic substance and was content with the onward march of man through his flux of experience. Humanism had its usual limitations. Santayana's Realm of Spirit illumines, enchants, and dies away.

These were the market place brands of philosophy in the year 1924. They were already the history of the last decade, but the discussion of the market place continued. What would come of it? It would be dangerous to prophesy, but history is not complete until an inventory of possibilities is taken. For that purpose, we may return to our analogy. If that is legitimate, we may look forward to a philosophical renaissance in the near future. First, the Platonism of the so-called realists remained; it is the *sine qua non* of all genuine philosophy Second, the mentalism of the so-called idealists had come to stay. Further, the two could not be mixed. Santayana's *Scepticism and Animal Faith* and the crudities of his behavioristic synthesis is evidence enough of that. The task facing all critical and honest philosophers in the year 1924 was to give some account of induction or the reference of the given to a system, and it was not to be solved by animal faith or divination. Messrs. Russell and Whitehead

used a suggestive device in the *Principia Mathematica* to solve the problem of mathematical induction. The number system, as we know, allows this extrapolation that means so much in all mathematics, but no one could say how or why. The authors faced the problem, admitted defeat; and assumed mathematical induction and proceeded to define the number system in such a way as to insure the validity of the inductive process. The idealists used to employ this device, and built up systems on which one could find perspective and order for the human life of their day. These perspectives and insights are inadequate for our world; to return to them or even to Aristotle and Aquinas is impossible, but with a Kant or a Socrates the sophistries and subterfuges of our popular philosophies would be uncovered and a way made for the courage and insight of a genius who could then make the spiritual affirmation and illumine the whole so that all could see and be wise.

PHONETICS. See PHILOLOGY, MODERN; and PHILOLOGY, CLASSICAL.

PHOSPHATE ROCK. The abundant supplies of phosphate found in the United States offset the utter deficiency of nitrates and potash. These three materials are essential fertilizing substances for agriculture and where not available must be imported. In 1920, the world's production of phosphate rock was estimated at 6,725,215 long tons, of which the United States produced 4,170,056 long tons. This, of course, was a record production, there being subsequently a marked decline. The phosphate deposits of Florida furnish from 75 to 85 per cent of the annual American output, and are followed by Tennessee and Kentucky. The two main types of phosphate rock are hard rock and pebble. The Florida deposits are mainly land-pebble rock, while the Tennessee deposits are of various types. In the western United States, phosphate rock has been discovered chiefly in Idaho, Wyoming and Utah, where they occur near the base of the Carboniferous. In 1924, the United States had two extensive phosphate reserves, one in Florida and one in the Western States, and there was no anxiety regarding future needs In fact, high-grade superphosphate had been produced by a copper-mining company from material mined in one of the Rocky Mountain States.

In 1920, over a million tons of raw phosphate rock were exported, valued at over $11,000,000, in addition to over 80,000 tons of superphosphate valued at $3,000,000. Nearly all of these deposits went to Europe, chiefly to Germany, Spain, Holland and Belgium, as the United States was the world's largest producer, followed by Tunis and Algiers. In 1913, the sales of phosphate rock in the United States were in excess of 3,000,000 long tons, but it declined during the War until 1915 when there were below 2000 tons with a further temporary decline in 1919. They then rose to over 4,000,000 tons in 1920, which was the banner year for the American industry. The quantity of phosphate rock sold in the United States in 1922 was 2,417,883 long tons, valued at $10,482,846, as compared with 2,064,025 long tons, valued at $12,270,070 in 1921. Of all the phosphate rock sold in the United States in 1922, 85 per cent was sold by Florida, whose sales amounted to 2,058,593 long tons valued at $8,347,522. Tennessee was the next largest producing State, with a sale of 353,309 long tons valued at $2,107,382 (including a small quantity of brown rock from Kentucky). Idaho was the only western State that produced phosphate rock in 1922.

PHYSICS. The discovery of X-rays, radium, the electron, and the constructive theories of the quantum, relativity, and the nuclear atom inaugurated an unprecedented advance in physical science during the first quarter of the twentieth century. Any attempt prior to this epoch to substitute for Newton's laws and Euclidian geometry laws of superior rigor would have been deemed heresy. The quantum of Planck and the relativity equations of Einstein have won their way steadily to a commanding position, the one by the beauty with which it fits observed phenomena, the other by the accuracy with which it predicts quantitatively phenomena contrary to those of classical mechanics. The one began as an empirical necessity, the other as a logical necessity; both have been astonishingly successful in their agreement with the observed facts of nature.

New theories, new tools of research, extended facilities, have stimulated the imagination and the creative activities of physicists so that cosmic theory is now applied to the motions and energies within the atom as well as to the sweep of the entire stellar system in the vast orbits which the stars are now presumed to describe in space The unit of energy is found, the atomicity of action discovered, and the whole numbered orbits, and whole number relations of atomic energies and spectra are working parts of the crucial attack on the problem of atomic structure

An astonishing increase in the kind of facilities available for physical research has taken place, and an equally amazing increase has taken place in the magnitude of such facilities. Physics is now cosmic in scope. It takes the crucibles of the sky as experimental laboratories. The stars and planets are dynamic systems, graphic points on the chart of the sky whose coördinates measure millions of light years and whose time scale is equally vast. This gives the physicist observational access to dynamic systems a hundred billion times the size of our own sun, and some of them four or five times hotter. It reveals systems moving through space a hundred times faster than the sun, and in all stages of stellar evolution.

The merging of astronomy and physics has created a new order for the physicist, has within a few years increased his perceptible universe to millions of times its former size. At the other end of the scale, the facilities of the physicist have grown in number and power. The atom gives him a glimpse of forces of the order of a million times those of the highest explosive created by man. For example, when the radium atom explodes it is on such a scale that if the earth exploded with relatively the same proportionate violence, it would drive off a mass equal in size to the United States, leave a crater a thousand miles deep, and never return for its speed would be 12,000 miles per second The physicist is to-day in the presence of forces hitherto undreamed of.

The production of two million volts, the maximum at this writing, foreshadows the attainment, perhaps surpassing, of the voltages of natural lightning. Model villages are now being experimentally struck by artificial lightning under measured control, in order to develop efficient protection from lightning.

Again electron tubes have been developed with 1000-kilowatt output, using 1800 amperes at 12 volts and a filament thick as a lead pencil. Electron tubes are reaching such proportions that world-wide telephony seems a certainty in the near future, and the physicist is at the same time being given facilities of which he had not conceived the possibility Again, X-ray apparatus has been developed in recent years to a point where hundreds of thousands of voltage may be used, permitting the body to be photographed in a fraction of a second where a half hour was formerly required. X-ray motion pictures are technically accessible to the physicist. The interior mechanism of machines has been photographed, the inner structure of natural stones, pearls, and even of metals is easily studied by this new-found radiation.

Another and really sensational tool of the physicist is the alpha particle, or the ejected helium nucleus from the radium atom. Easily the most powerful projectile known to science, it became in the hands of Rutherford a means of disrupting the nuclei of the lighter atoms, thus achieving the first controlled transmutation of the elements.

Another facility recently developed into a powerful research facility for the physicist is the positive ray spectrograph Thompson, Goldschmidt, Dempster, and Aston have perfected means of projecting and deflecting the positive and negative parts of the atom after disruption so that they leave traces on the photographic plate at distances which may be translated directly into mass indications This has permitted the discovery not only of masses of different elements, but the different masses of the isotopes of any given element. Neon atoms of masses 20 and 22, in number 90 per cent and 10 per cent respectively, have thus been detected.

The quite astonishing verification of Prout's hypothesis of a common building material with whole numbered multiples of this constituting the atoms of the elements, has thus been achieved since 1915, based upon the thoughts of prior writers who have frequently suggested that the usual atomic weights are not fractional, but average weights of variant atoms. Atoms of the same element varying in mass are isotopes having the same behavior. Atoms of different elements may have the same weight and different behavior—for example, lead and bismuth derived from thorium (disintegration) have atomic weight 208 but display the characteristic behavior peculiar to each element notwithstanding. Positive ray analysis permits the discovery quite unexpectedly of undissociated groups of atoms. The method is now available as a most powerful tool for the physicist.

Devices have been developing for measuring the X-ray patterns as reflected by the space lattices of crystals, and thus disclosing the distribution of the atoms in a crystal. The significance of crystal lattice study as practiced to-day is that the fundamental fine structure of crystals is now possible. The ordinary amorphous or mixed solid has been likened to an orchestra at practice, each player playing the same tune, but at different points in the piece, but that in crystals the atoms, like the players, are all playing the same tune at the same place in the piece, so that at once the melody is apparent. Something like this is the view of the crystal gazer of to-day who is allocating the ions and atoms, and even the electrons to their proper places in the space lattice Astonishing results have already been attained.

The crystal lattice appears now as dependent upon the number of outer electrons, the form being the same for any given column of the periodic table. Such lattice is geometrically demonstrable as the natural position. For example, the alkali atoms have body-centered cubic structure, since the outer electron and the remainder of the atom form two parts which being respectively negative and positive arrange themselves in space alternately in the elements of a body-centred cube. Likewise the column two atoms, with two outer electrons in each atom form a hexagonal space lattice, the electrons at the angles of a hexagonal prism and the ion at the centre of the prism. Crystal structure thus becomes the same periodic function of the atomic number as the other properties of the elements. Hull expects that this method will

yet reveal the position of the binding electrons in the crystal lattice directly.

As a result of the determination of the intra-crystal orientation of the atoms, the crystal forms arrived at give simple and natural explanations of certain physical properties of these substances. For example, aluminium and other face-centred cubic arrangement of atoms (an atom at each angle and at each face-centre) are soft and ductile. The reason is simple There exist four planes in such cubes in which the atoms are so closely packed that one plane slips easily over the one below without elevating it, hence with minimum change in the attractive distances between the atoms Less ductile are the body-centred cubic metals (an atom at each angle and one at the cube centre) since they are more fully interlocked and the interatomic attractive distance must change during gliding. This group includes such metals as iron and tungsten.

The hardness of the diamond is quite naturally attributable to the tetrahedral arrangement in which gliding is impossible since the atoms in this type are interlocked in the most stable manner. Shore has found that the diamond under good conditions can support a load of two million pounds per square inch. Hull states that simple cubic salts such as lithium fluoride and sodium chloride do not permit gliding since the atoms are bound electrostatically, each ion being surrounded by six opposite charges.

Relativity. The year 1915 was notable for the publication of Einstein's (q.v.) short but epoch-making paper on his generalized theory of relativity. This, with his paper published in 1905 on the special theory of relativity, has wrought the most profound advance in physics since Newton The finitude of the material universe, the derived non-objectivity of time and space, the meaninglessness of absolute motion, the effect of gravitational fields on light and other radiant energy, the equivalence of mass and energy, the acceptance of time as a fourth coördinate, the introduction of the relativity effect of the finite velocity of light into physical equations, and the establishment of purely relativity equations—all these were so new to the physicist who had not followed the course of philosophical or mathematical theory that skepticism, even ridicule, greeted the new theory set forth by Einstein.

To demonstrate his theory, Einstein selected three necessary results of the theory which might be tested by observation, each of them contrary to the classical laws of mechanics and inexplicable under classic physics. He even predicted these results quantitatively by the simple use of his relativity equations unmodified by special assumptions. The three predictions have now been confined by observations of unquestioned precision. The agreement is better than 1 per cent. Classic physics was shown to have failed in crucial tests. Einstein's view that time and space are abstract derivatives of reality and in themselves unable to control or influence anything is certain to have a profound effect in recasting physics. At the same time, space and time are made joint coördinates of the four-dimensional continuum for the graphic plotting of an event.

Testing the Relativity Theory. The first test of the relativity theory was the mathematical determination by relativity equations of the full value of the rotational precessional of the perihelion of the planet Mercury. The rotation is in the direction of motion of the planet and was inexplicable according to Newton's laws by an amount equal to 43 seconds of arc per century. The Newtonian failure was notable, small as it was. Using relativity equations without special assumptions, Einstein computed the true rate of rotation of the perihelion of Mercury to within one second of arc per century. His success was astonishing and furnished the first confirmation of his theory.

The relativity effect on the apse of Venus is too small to observe since the orbital eccentricity is too small. The relativity effect of like character has been observed for the planet Mars but observational confirmation of the exact amount must await fuller data. In the case of Mercury, Einstein amended the inverse square law by changing the square or "second-power" of the distance to read the "2 00000010 power" of the distance. Slight as it is, it affords confirmation of the theory which is destined to play a reorganizing part in physical theory. For example, the fine structure of spectrum lines involves the change of mass resulting from relativity effects on the elliptical orbits of the electrons by which the perihelion increase in mass with increased speed alters the frequency of the electron revolution about the nucleus. In other words, relativity has, perhaps, one of its strongest confirmations in the structure of each spectrum line, since the fine structure is a graphic portrayal of the actual effects of relativity.

A second triumph even more spectacular was the confirmation of Einstein's prediction that gravity affects light and that starlight passing the sun's disk at grazing incidence would be deflected on his theory by an amount twice the value to be looked for from classical theory. Maxwell long before had shown that light waves should exert pressure. Years later experiment confirmed the prediction The doctrine of conservation of momentum implied that light carries moving mass. The wave front having momentum and exerting a pressure is in a sense "temporary matter" which might be affected by gravity.

This was put to the test at the eclipse expedition of May, 1919. It was only at a total eclipse that the stars could be photographed to test the theory by recording their apparent position. If the photographic images near the eclipsed sun during totality showed displacement equal to that predicted by Einstein—double that called for by classical mechanics—it would be strong evidence for the relativity theory. But if the amount was one-half that predicted by Einstein, then Newtonian laws might account for the displacement.

Decisive success came on May 29, 1919, when at Principe light from near-by stars was found deflected by the sun almost equal to that predicted. At Sobral the deflection found was slightly in excess. Campbell in 1922 in the most careful eclipse observations yet made found his observations as finally adjusted gave 1.75′ and agreed within about a half of one per cent with the Einstein prediction. The mass of Jupiter is great enough to produce a perceptible deflection and an occultation of a star by this planet may yet be a favored method of studying this phenomena. Einstein had said that a hundred experiments might support his

theory but that one adverse result would destroy it.

The third prediction to be verified was that in the gravitational field of the sun light waves would be lengthened—for example, about 0.008 Angstrom unit for blue light of wave length 4000 A. Grebe and Bachem, however, in 1920 reported that they had detected a lengthening equal to the recession of the light source 0.56 kilometer per second as compared with Einstein's prediction that it would equal a recession of 0.634 kilometer per second. An atom in the sun was thus shown to vibrate at a slower rate than a similar atom on the earth. St. John, at Mt. Wilson Observatory, reported to the National Academy, at its 1924 session at Washington, that he found confirmation of this predicted effect in an elaborate series of measurements of the shift of spectrum lines.

The abstract mathematics used to enunciate Einstein's theory were such that few physicists could follow the reasoning. The verification, however, of three predictions contrary to classic mechanics could be comprehended by all but could be ignored by none.

In the words of Planck, Einstein's theory "surpasses in boldness everything previously suggested in speculative philosophy and even in the philosophical theories of knowledge," and that "the revolution introduced into the physical conceptions of the world is only to be compared in extent and depth with that brought about by the introduction of the Copernican system of the universe."

Trend of Modern Physics. Modern physics has been the sphere of so many and such fundamental series of discoveries that there was pressing need for a complete restatement in terms of fundamental elements. Slowly through the centuries, the consequences of these elements have become simpler as identities were found. Parallel to this the consequences of the interaction of these elements have become more complex. Man's control of these elements has become so great that to-day he can take the electron from an atom and study the light produced when another electron takes its place. This example is a type and a forecast.

The trend of physics is steadily toward the complete control of the ultimate elements of matter and of energy, the ultimate units with which physics has to deal. To restate the fundamentals of physics does not mean that we have completely mastered either the elements or the principles governing their interaction. A true restatement merely implies a more fundamental basis. The superstructure is yet to be built.

The success of the new physics based on the fundamental units of matter and energy foreshadows greater triumphs to come. The crucial fact is the identity of matter and energy from which follows the identity of the electron and the unit electric charge, so that matter and energy, the basis of action, have one and the same essence. The electron thus becomes the focus of the vast movement in science and philosophy, a twofold movement of human thought seeking the ultimate unit of matter on the one hand and the ultimate unit of energy on the other. The two paths led to the same ultimate unit—the electron pair.

Exactly as matter has been unified and the elements ranged in an evolutional sequence consecutive and alike in essence, so radiation from electric waves (gamma) 2×10^{-10} cm. to those of radio wave lengths has been unified into a continuous spectrum of 55 octaves. Fluorescence, which is frequency transformation of light waves, seems destined to give the means of transforming any frequency of electric waves from the shortest gamma to the longest to any other desired frequency. This is the analogue of the transmutation of the elements. It is true that neither is fully at hand, but with the fast perfecting knowledge of the laws and mechanism of radiation, it seems fair to expect great progress toward the protection of any element from any other and of any electric waves to others of any desired frequency.

The knowledge of critical frequencies and critical voltages is rapidly becoming more definite. This will give the physicist and the chemist the means of initiating and controlling chemical reactions otherwise impossible of human control The duplication of the chlorophyllian reaction by means of ultraviolet radiation is a significant experiment forecasting great achievements. That sugar can be made directly by photosynthesis from moisture and carbon and ultraviolet radiation seems incredible, yet this is credibly reported by Berthellot. In fact, Perrin and others suggested that all chemical action is by means of radiation, and that without the proper radiation, a chemical reaction is impossible.

Atomic Structure and Theories. That action should be found atomic was quite unsuspected and is still inexplicable; that the least common multiple or cosmic unit of action should be measured to within one part in six thousand and take a dominant place in the computation of atomic structure and spectra as well as in other branches of physics brings us to the point where we are almost ready to say that we have reached at least the ultimate units of matter and energy and action in the broadest sense Expressed in energy units based on the second, gram, and second, the numerical value of Planck's universal constant of action is 6.555×10^{-27} erg seconds.

Recent physics has witnessed the "electrification" of the atoms, and such properties as tensile strength and resistance to compression, which have been called "mechanical" must be regarded as electrical. Tensile strength is the attraction between ions, resistance to compression is the repulsion of like charges or like poles of magnets. The structure of the atom now disclosed gives a vivid picture of the mechanism and mode of operation of the "properties of materials."

Now that energy is known to have momentum and inertia, we are free to revive the *energetik* of Ostwald, and with Le Bon and Einstein conceive nature as a phenomenon rather than a thing and to regard atoms as systems of energy rather than dead inert matter swept by chance forces into fortuitous concourse called material systems. Nor is this new *energetik* a mere idea, we can measure the increase in mass with velocity, witness the transformation of energy into mass and mass into energy, and can compute the energy equivalent of mass of any element. If mass is all energy, then a gram of any kind of matter has as its energy equivalent 90,000,000,000 ergs of energy, that is the mass multiplied by the square of the velocity of light.

Radiation and Pressure. That the mass of radiation which causes its pressure is not a

mere abstraction of academic interest only, is seen in the theory of giant stars and the powerful rôle which radiation pressure plays in the architecture of stellar evolution and especially in limiting the growth of mass to approximately 10^{35} grams, the mass at which radiation pressure begins to far exceed the inward pull of gravitation. Practically all the stars are between 10^{33} and 10^{34} grams, where ether pressure of the soft X-rays just begins to dominate the situation. Knowing the mass, it becomes possible to compute the highest temperature through which an old star has passed, and knowing its size also, it becomes possible to tell what stage of its evolution it has reached.

In the days of Laplace gravitation was assumed as the only building force of the cosmos. His famous nebular hypothesis received overwhelming support by the discovery during the past 50 years of the spiral nebulas numbering perhaps millions About the middle of the past century the pressure of light was postulated from theory, and later confirmed. In the heart of a star the pressure of light is now known to sustain most of the vast weight of the star's mass.

During the eclipse of 1922 it was found that the sun's atmosphere was being driven away from the sun with a speed that increased steadily. Such an increase could only be due to an accelerating force constantly at work. This force was promptly recognized as light pressure. The same effect was observed when Halley's comet was seen to disrupt, a small portion of the head breaking off. The lower momentum and smaller size of the detached particles caused them to be driven away from the sun relatively to the head of the comet. Gravitation and the pressure of radiation are now recognized as jointly determining the architecture of stars and stellar systems.

Nothing in the history of science compares with the sensational attack upon the problem of the structure of the atom and the amazing results which have been obtained during the past few years. They open up a new universe, infinitely small, within the atom—yet coextensive with the great universe about us. Mendeléev, Shenstone, and others had imagined an infra-cosmos in which atoms were planets and molecules were stellar systems. The atom is, in fact, now known to be a solar system, the smallest constituent of which is perhaps a trillion times the volume of the entire atom. The hydrogen atom, the simplest of all, was quite naturally the first studied, and as suggested by Prout it turns out to be the unit of which all later atoms are built. This atom is one ultimate unit of positive electricity around which circles one unit of negative electricity. As early as 1881, Stoney and Helmholtz had independently suggested that electricity was atomic in structure. Stoney had already named the atoms electrons.

Development of Atomic Theory. Hundreds of notable names suggest themselves as playing parts in the steady stream of atomic knowledge which formed the atomic theory as it appears in 1924. Faraday discovered the law of electrolysis, Berzelius had developed his electrochemical theory, and Arrhenius the theory of electrolytic dissociation. Then came Lenard, J. J. Thomson, Crookes, and others concerned in disclosing the electron itself as a discrete entity. Curie brought radium to light from which electrons and helium nuclei were ejected and gave a dynamic example to the physicist of of disintegrating atoms. Soddy advanced the thought, foreshadowed by Crookes, that the atoms might vary in weight even for the same element and examples were afforded in radioactive transformations. Variant weight atoms of the same element were called isotopes. Thomson and Aston perfected the means of studying them and the latter provided proof that the atoms, except hydrogen, had integral atomic weights.

At this juncture Planck's quantum theory became in 1900 an essential factor in the field of radiation. Balmer, Rydberg, and Rits had given an equation for computing the spectral lines of the Balmer series. The outstanding question remained: why were special favored frequencies alone possible, say, in the Balmer series of hydrogen? On classical assumptions and electrodynamic theory no explanation was forthcoming.

Planck found complete agreement on the assumption that the energy of the vibrating electrons could not change continuously but always in whole numbers of what he called "energy-quanta." Thus Planck's constant took its place as the factor which multiplied by the frequency gave the energy quantum. This latter relation was pointed out by Einstein who based upon it his theory of the photoelectric effect. Not yet, however, was it possible to reconcile interference phenomena with the theory of quanta, and it is just such phenomena that reveal the meaning of the frequency thus computed. Bjerrum's prediction, verified by Eva von Bahr, that rise in temperature would cause spectrum lines to split up into discrete components became a vivid proof of the reality of the quantum.

Then came Rutherford's development of Rankine's suggestion and Nagaoka's theory that the nucleus of the atom would be found to be positive, since the electrons were negative. We can fairly attribute the establishment of this fact to Rutherford in the year 1911.

Bohr's Theory. Two years later, in 1913, a young physicist at Copenhagen, Niels Bohr, attempted the final step of postulating certain conditions which might account for the stability of atomic structure and the properties of radiation from the atoms in accordance with the observed relations. The essence of this is that certain favored orbits alone could exist and that these bore such relation to each other that the radii are proportional to whole numbers. For simplicity suppose these represented by circles. The favored series within which alone stability existed were circles having radii 1^2, 2^2, 3^2 . . . n^2. An electron might jump only by whole number intervals. No radiation takes place while an electron is moving in one of these orbits. If an electron jumps from one of these to another, the difference in energy is equal to Planck's constant times the frequency.

Bohr's two postulates gave a basis for the stability of the atom, and for the discrete frequencies which we call spectral lines. A second step assumed that these discrete orbits were radial quanta and that there existed also ellipses of azimuthal quanta, both of which together determined the size and shape of the orbit of the electron.

Bohr borrowed from astronomy the concepts of orbits. He showed that for hydrogen the spectral series (Balmer, for example) could be

computed from theory assuming Coulomb's law and the discrete stable orbits (nonradiating). For example, the hydrogen alpha line of the Balmer series of hydrogen represents a release of energy equal to the difference between the energies of the 3d orbit and the 2d orbit having equivalent radii respectively 3^2 and 2^2, or ellipses of similar energy content.

The characteristic of the Balmer series is that the orbit of arrival is No. 2, the orbits of departure being respectively 3, 4, 5, 6, . . . n . . . theoretically on to infinity Naturally the electron fall from infinity to orbit No. 2 would give the maximum energy release—just equal to the ionization potential. The latter is the voltage required to give electron speeds sufficient to drive an electron from an atom permanently. The ionization potential becomes one of the great basic constants affecting not only spectroscopic theory but all chemical reactions as well. If the ionization potential is divided by the Planck's constant (6.555×10^{-27} ergs) the result is the frequency of the shortest wave emitted by the atom in the Balmer series. Such very simply was Bohr's theory. It has had many brilliant confirmations, notably the work of Sommerfeld in accounting for the fine structure of the spectral lines, in 1916.

In 1914, Lyman discovered the series in which the orbit of arrival was Orbit No. 1. Paschen had long before found the spectral series for which the Orbit No. 3 was the orbit of arrival. In 1922, Brackett observed several lines of the series terminating in the fourth orbit The simplicity of the theory may be stated thus: all emitted or absorbed radiation is produced by change of orbit. For hydrogen the difference of the inverse squares of the orbit numbers gives the ratio of their frequencies. A falling electron emits, a departing one absorbs energy. The mathematical treatment of the hydrogen orbits is now relatively simple. Such treatment of the helium orbits is still impossible, except for special cases of assumed structure. The problem of three bodies (hitherto insoluble) now assumes great importance in the further study of the atom and its spectra.

At this writing (1924) the outstanding achievement in this field is the closing of the gap in the entire electric wave spectrum by E. L. Nichols. Thus the shortest gamma ray and the longest used in radio are united into a single series constituting the electric wave spectrum and comprising the gamma rays, X rays, heat, light, and radio—all separately named as their unity had not been proved until recent years. To-day the unity of the electric waves from 2×10^{-10} cm. to the maximum radio waves is as complete as the periodic system with the difference that while the properties of all the elements are known, five are still missing from the series of 92 believed to be possible under observed conditions.

Spectra. The spectra, then, become a means of studying the energy and structure of the atom. The emission spectra are of various kinds which it is not the purpose here to discuss except to say that the eccentricities of the elliptical orbits appear to give rise to the so-called principal, diffuse, sharp, and fundamental series in conjunction with the Lyman, Balmer, Paschen, and Brackett series referred to above.

The complexity of the later elements of the periodic system gives rise to corresponding complexity in their spectra. A method of approach has been devised by the determination of spectral terms on the theory now established that each spectral line represents the difference of two spectral terms in accordance with the quantum theory and the Einstein relation $E = h\nu$, whence $E - E' = h\nu'$. The work of Catalan, Meggers, Walters, Kiess, and others carries the analysis of the spectral frequency relations into the most difficult elements of the periodic system, even including the most complex spectrum, that of iron. The similarity to the hydrogen spectrum is shown in that the terms in each series may be given by the expression $K/(n-a)^2$, K being the same constant used in the case of hydrogen, n the term number, and a, a special constant for each series.

Bohr then regards the above relationship as ground for viewing spectra as "the last step of a process whereby the neutral atom is built up by the capture and binding of electrons to the nucleus, one by one." Spark spectra are now known to be due to ionized atoms and represent the last step but one in the formation of the neutral atom by the successive capture and binding of electrons, the usual arc spectra representing the last step. We have thus the basis of studying the evolution of the periodic system of the elements—a field which at this writing is one of intense interest and activity.

The impact of electrons at controlled speeds has become a means of throwing light on the energy required to change the state of energy of the atom and experimentally checking up the magnitude of the spectral terms. Frank, Foote, Mohler, and others have done notable work in this direction, as related in Foote and Mohler's brilliant work *The Origin of Spectra*

In 1914, Stark discovered a remarkable splitting up of the hydrogen lines when subjected to an electric field. Two years later Schwarzschild and Epstein both succeeded in accounting for this effect, and in 1917 Sommerfeld and Debye worked out the explanation and details of the Zeeman effect on the basis of Bohr's theory of atomic orbits. In 1922, Stern and Gerlach split a stream of atomic silver into two parts, showing that the single outer electron in its rotation makes each atom an electromagnet, and when passing a sharp-edged magnet repelled like or attracted unlike polarities, making two streaks as graphic demonstrations of the Bohr theory.

These three astonishing confirmatory achievements combined with that of Sommerfeld account for the fine structure of spectral lines on the basis of the relativity effects in the elliptical orbits of departure and arrival. The computed and observed Stark effects on the hydrogen gamma line (for example) are in striking accord both as to position of the components and their relative intensities, both of which facts are confirmatory of Bohr's theory of interorbital transitions of electrons. Kramer has given the details from the standpoint of the Bohr theory.

Bohr himself, on the basis of spectra and other considerations, has published a summary of the electronic distributions on each atom of the periodic system. J. J. Thomson (in 1904) had suggested that the electrons are arranged in groups concentrically, each new group representing a new period of the periodic system. Kossel (1910) developed the idea, and G. N. Lewis and I. Langmuir, basing their speculation on the possible cubic outer grouping of Column VIII atoms of the inert gas group, postulated

statical equilibria of the tetrahedral atoms of Column IV with the electrons at the corners of the tetrahedron.

Valency on this view became the number lacking to complete the cubic configuration. The general applications and extensions of this view are now available in some of the general texts and will not be recited here. The situation in 1924 was remarkable. The curve showing the relation of square roots of the spectral terms has been studied intensively by Siggbahn, who continued the fundamental researches of Moseley. The astonishing linearity of the X-radiation of the *K* and *L* orders enabled the prediction of the existence of Atom No. 72, and its subsequent discovery in zirconium, titanium ores, and later its isolation in quantity. This new element was named by its discoverers "Hafnium" after the ancient name for Copenhagen "Copenhafn." The workers in the atomic field are many, and the detailed works are found in every physical journal, for the subject in 1924 had become the outstanding problem of science, full of promise for discoveries of the most important and probably epochmaking kinds.

Whittaker pointed out a possible model of the atom capable of unreversed action upon a moving electron passing towards and through an atom and which demands all exchanges between the kinetic energy of electrons and radiant energy to conform to the Planck quantum equations. The electrons in each atom comprise two groups or magnetic systems, the inner has moment and may turn in an applied field, the outer fixed relatively to neighboring atoms takes its proper place in the space-lattice of the crystal. As an example, Ewing made a model with eight fixed magnets pointing along the diagonals of a cube, their centres being at the corners of the cube. An approaching electron may be turned back (inelastic collision) since a rotating magnet takes up its force and causes it to recede giving back the energy as the rotating magnet is again brought to rest. If moving with sufficient speed or energy the electron will move clear through the atom but its energy is transferred to the excess over the critical amount, i.e. the quantum. The iron atom may thus be assumed as having 2 *K* electrons surrounded by three concentric parallel cubes, an electron at all corners of three cubes, making 26 electrons in all corresponding to atomic number 26.

Industry begins to recognize the utility of fundamental physics. A striking example is the recent progress in the study of the metals by means of the new atomic theory and X-ray analysis. These have revealed that the crystal of a metal consists of atoms arranged as regularly as the spacing on a checkerboard. For the more complex sizes and shapes of atoms the forces naturally cause characteristic space-lattices. If this lattice is made up, as in an alloy, the solute atom causes some distortion. Rosenheim has advanced the theory of "the substitution of the solute atoms for an equal number of the solvent atoms in a solid-solution lattice." The fertility of this conception can only be suggested, but its basis in fundamental physics gives promise of a new study of the structure of alloys which hitherto has almost resisted attack.

One outstanding aspect of the new physics is that "properties" are becoming based upon "ultimate" units—electrons, the electric field, Planck's constant, definite radiation frequencies, critical potentials, the velocity of light. Upon the basis of these, physics has begun the synthesis of physical forms which we call material bodies. With great rapidity the space-lattice is being determined by observation with X-rays, and in turn being computed from the constants of the electronic charge. It is not too much to say that this method of approach has given the new physics as nearly a fundamental or ultimate basis as we could without present knowledge conceive. The conviction is deep and insistent that physical science is fast converging upon the complete control of matter and energy which will give the physical basis for a new social order.

Harkins gives a periodic system of the elements based on the *H* and *Hc* atoms as units in building up the positive nuclei. Elements of even atomic number (carbon, oxygen, neon, magnesium, silicon, sulphur, argon, calcium, scandium, chromium, iron) all have atomic weights divisible by 4 (the atomic weight of helium) The positive nucleus of helium is the most stable next to the hydrogen nucleus, hence is well fitted as a stable building unit for more complex atoms. Almost direct dynamic confirmation that helium is such a building unit is found at the other end of the periodic table in uranium (atomic number 92) which disintegrates by losing one alpha particle.

Radium and its successors also progressively disintegrate by ejecting helium atoms, reducing from time to time the atomic weight by 4 with each ejection. So much for elements of even atomic numbers. Elements of odd atomic numbers, according to Harkins, are probably compounds of helium and hydrogen, computable by a simple formula. The even-numbered elements are, however, naturally more stable, as evidenced by the fact that 10 elements of even atomic number make up over 97 per cent of the meteorites and that the atoms of the even-numbered (helium) series are 127 times more abundant in the iron meteorites than the atoms of the odd-numbered (helium-hydrogen) series.

An event of truly stragetic importance in physics was Rutherford's success in breaking down the positive nucleus of the lighter atoms. Using the alpha particle (helium) from radium *C*, Rutherford had a projectile with a velocity of 19,000 kilometers per second; 20,000 times that of a rifle bullet. He had available in a single particle a stress-producing energy of 5 kilograms of weight at the closest approach to the nuclei encountered. The momentum at the high velocities is such that a gram of helium at such velocity would have a striking energy equal to that of a 300-ton projectile at a velocity of a kilometer a second.

With this projectile he bombarded hydrogen atoms, and in a relatively few of the total encounters between the alpha particle and the hydrogen atom, a head-on collision occurred, in which the momentum of the former was transferred to the latter, giving it a range four times that of the alpha particle. This was quite in accordance with theory. Unexpectedly, however, he found that in pure nitrogen the particle produced ranges as long as those produced in pure hydrogen. As the nitrogen atom has several times the weight of the helium atom, by control experiments he eliminated all explanations except that the nucleus of the ni-

trogen atom had been broken up by the swift alpha particle and a hydrogen nucleus detached from the nitrogen nucleus. The latter presumably consists of three helium and two hydrogen atoms (making the total atomic weight 14, that of nitrogen).

The long range atoms were detected by absorbing screens of metal which stopped the alpha particles but permitted the higher speed hydrogen atoms to pass to the scintillating screen. In any case, a new method of research has met with success and for the first time the positive nucleus has by intent and under control broken up. Other light atoms have yielded to similar bombardment.

Soddy has published a series of interesting papers summarizing the transmutation in radioactive changes, the disintegration of radioactive material, ultimate products, radiations, average life, branch series, chemically nonseparable elements. He concludes that radioactive changes are quite distinct from the usual chemical changes.

Chemical reactions are accelerated by rise in temperature, being doubled in rate for each 10 degrees rise. The reaction would thus be 10,000,000,000 times faster for each elevation of 300 degrees But the radium disintegration remains absolutely unaffected by such change. Heat, light, magnetic field, high concentration, or extreme dilution produce no effect on the rate of radioactive disintegration The particle is ejected with prodigious speed, 20,000 kilometers per second, from the radioactive atom. This is the helium nucleus (mass 4) but niton, the resulting product, recoils with a velocity of several hundred kilometers per second. The alpha particle passes 100,000 aluminium atoms before it is stopped. The initial energy of such a projectile is more than 100,000,000 times greater than that of a molecule in ordinary thermal agitation. Individual energy of a particle is 10^{-5} erg.

It is characteristic that unsuspected indicators of phenomena are found in this interchange of scientific thought Estimates of the age of the earth are based upon the atomic lead and its percentage in uranium ores. Knowing the rate per year at which the lead is accumulating from the final stage in the disintegration of uranium atoms, the age of the ore is readily computed. The figures check with good concordance with the age of the earth (forming of the ocean beds) as estimated by six other methods. Apart from its unique interest, the method is capable of effective use in geological theory.

Astronomy and Physics. Astronomy in turn has gained as well as given in its contact with physics. Belot holds that of the forces which dominate attraction in the architecture of the universe, gravitation blends all into one mass. The dispersive forces prevent agglomeration, such as molecular attraction, gas pressure, radiation pressure, electrical and electromagnetic forces. Crystalline growth operates against gravity as do many other forces of growth, but attraction does not produce the primitive dispersive impulse. Attraction ensures stability but the architecture is the resultant of all the incident forces.

A large-scale example of light pressure observed by Bell is shown in Saturn's rings. These rings are thin strata of bodies of meteoric size, surrounded and permeated by dust invisible except through deep layers. This dust is wind driven by gravitational waves and the pressure of radiation which moves the particles back and forth through the sunlit side to be seen below when light filters through. The acceleration due to solar radiation is, for particles of micron size, nearly 350 kilometers a day, a demonstration of Maxwell's theorem on a colossal scale. According to modern physics the mass of all stars rests upon radiation pressure. For example, 95 per cent of the mass of sun is supported by the radiation pressure of the intense X-rays generated in the heart of the sun under gigantic gravitational pressures. See ASTRONOMY.

Solar Physics. Solar physics is the object of particular study among other things, on account of the correlation which Abbott and others are establishing between solar variations and terrestrial meteorological phenomena. Angenheister finds the sun hotter at sunspot maxima. These show strong vertical movements, cooler layers sinking, hot masses rising, increasing the radiation. Jupiter and Encke's comet varies in brightness with the sunspot cycle, the maxima coinciding. Evidently factors other than temperature at spot maxima cause the striking 11-year cycle in tree ring growth. Mean air temperatures are at least one-half degree lower at spot maxima. The influx of cool air from higher latitudes is greatest at spot maxima, as shown by the records of the winds at Samoa. Trade winds at that point appear to be 10 per cent more frequent. The frequency of cirrus clouds also parallels the spot cycle. The air at spot maxima absorbs 0.05 calorie per square centimeter less per minute and the mean temperature of the earth drops a fraction of a degree. Abbott, Fowle, and Aldrich give 1.94 calories per square centimeter per minute as the solar constant, based on 20 years' observations.

The work of Douglas and others in correlating the variation in growth of the annual rings in trees with the sunspot cycle has been an outstanding achievement of recent science. So well advanced is this correlation that the particular years in which a tree was planted and cut down can often be deciphered from the characteristic pattern of the curves of ring growth sequence. Petrified forests may yet disclose prehistoric weather cycles and tell much regarding solar radiation in geologic times. The subject is fascinating. Every lumber camp becomes a potential solar and terrestrial weather observatory, and every tree has its tale to tell of the sequence of weather changes through which it grew. Douglas describes observations of cloud formations taken from an airplane including record of temperature within the cloud and the surrounding air and the dimensions of the cloud formation. A new field is now open for airplane work in collecting data with suitable autographic instruments.

Jeffreys accepts the tidal theory of the origin of the solar system, showing that mere condensation could not produce the system. His results agree well with the age of the earth as determined by its radioactive constituents. He also shows that no satellite less than 1000 kilometers could have been gaseous since the mass could not hold itself together in gaseous form. He assumes that the asteroids were formed from a primitive planet broken up by the tidal action of Jupiter.

Michelson has obtained the first measure of the diameter of a star—alpha Orionis—the bright red star Betelgeuse of magnitude 0.7 in the constellation of Orion The result is startling, for it gives a diameter 300 times that of the sun, or a volume 27,000,000 greater. He later found that alpha Scorpionis—Antares—had a diameter 500 times that of the sun or a volume 125,000,000 times greater. The principle is to admit the starlight by two parallel slits in the field of the telescope. The diffraction pattern formed depends upon the distance apart of the slits. For each size of star disc there is a definite distance apart for the discs at which the diffraction pattern disappears owing to the optical interference effect in the waves forming the two sets of diffraction fringes. By adjusting the slits until this occurs and measuring the distance apart, the angular diameter of the star disc is computed by simply multiplying the wave length used by 1.22 and dividing the distance apart of the slits.

A striking application of Bohr's theory comes from astronomy. Plaskett found in Class O stars spectral lines of ordinary hydrogen and of helium atoms which have lost an electron. These nuclei have only one satellite each. Bohr has computed the orbits and the positions of the spectral lines. The heavier helium nucleus changes the orbital frequency by the computed amount. From the separation of the lines the electrons and nuclei reveal their relative masses. Plaskett has found a star (22,000° C.) so hot that helium atoms are all ionized.

"Invisible sunspots" were studied by Hale and Ellerman. Beginning with the theory that the normal type is the "twin bipolar," 970 spots showed the percentage of bipolar spots to be 61 per cent. In seeking companions for single spots local magnetic fields were discovered near the spots. The first such field discovered had the polarity and position usual for the following component of a regular bipolar pair. In several cases, invisible fields gave rise to spots, and in cases where spots had disappeared traces of magnetic fields were still detected. If the vortexes of a bipolar group penetrate deep enough they must certainly unite to form a half ring.

Light Studies. Ives revives interest in the firefly, stating that if the light of the firefly were spread over the entire visible spectrum it would still excel many times the efficiency of any artificial light source. It will be recalled that Coblentz found the luminous equivalent of radiant energy as about 50 candles per watt. Colorimetry, for which physicists like Priest and others are laying basic principles, is fast taking a high place as an exact science.

Harvey has completed the first big step toward the production of artificial light from organic material. He obtained a candle power from 30 square inches of luminous solution of luciferine. Dubois and Harvey have extracted "luciferose and luciferine" two substances supposed to be the cause of animal light. Luciferine emits no light on agitation, but luciferose bursts into a momentary brilliancy if shaken. When mixed the two substances emit continuous light, apparently requiring oxygen or moisture.

Acoustics. Applied acoustics had great opportunities in the War. It was active notably in the production, transmission, and reproduction of sound, exemplified notably in the use of acoustical devices for detecting enemy planes, locating enemy batteries, and discovering sappers at work underground. Huge parabolas used as reflectors with sensitive sound receivers detected planes approaching Paris 30 miles away. Apparatus was promptly devised to locate enemy batteries with high precision. Sensitive geophones effectively disclosed enemy mining, and sound ranging was developed to a point where the length of the type of gun had to be taken into account so accurate was the location of enemy batteries by sound-wave triangulation. Battle firing permitted the study of sectors of sound, and speeds of concussive sounds were measured as high as three kilometers per second and pressures as great as 300 atmospheres. The gradient was so steep that 30 meters from the sound source the speed dropped to 400 meters and the pressure to two or three atmospheres.

Radio-Communication. The faintness of radiotelephone sounds even at moderate distances led to the development of amplifying electron tubes. The uses of electron tubes are unique in the annals of invention and are in a state of rapid development at this moment. Their design and construction command exacting theoretical and experimental physics. Research engineers have developed the amplifier which can magnify sounds trillions of times, in fact, to the point where their volume cannot be endured and where structural materials would collapse if the sound were continued. The microphone is now supersensitized and connected to an amplifier permits the human heart beat to be heard across the ocean.

Radio-communication has awakened research and invention the world over both by experts and amateurs. The Armstrong regenerative circuit is an example of amateur work of notable importance. Applied physics will be the factor in eliminating strays, static, distortions, and this result combined with the perfecting of amplifying tubes will bring a new era in radiotelephony.

Jewett reported that it was possible to transmit and amplify by radio without distortion. There remained the perfecting of the reproduction of sounds at the receiving end without distortion.

The application to the inaudible sounds of the insect world, too faint or of too high a frequency to be normally heard, opens up dramatic possibility of vastly extending aural perception much as the microscope and telescope and camera have extended our vision to the infinitesimal, the infinitely remote, and to the vast gamut of radiations which are too long or too short to be directly seen by the eye.

The study of "sound spectra" of musical instruments awakened an interest which should soon be fruitful in practical application. This analysis gives the respective wave lengths and relative intensities of the simple sounds component of any musical note revealing quantitatively the causes of the characteristic quality of the sounds of musical instruments.

Physics in 1924 had before it the task of studying the entire range of molar vibration frequencies and amplitudes. Such a study would unify molar waves in a manner similar to the just completed unification of electric waves. Ellerman's "hydrogen bombs" discovered in the solar spectrum give evidence of prodigious explosions in the sun. Volcanoes and earthquakes also give rise to vibrations which

shake the entire globe. From such vibrations to those too fine to be yet perceptible is a virgin field for acoustical research and experiment.

Rhythm and Resonance. Already at Munich the technical physicist is studying vibrations in connection with mechanism with a view to enhanced efficiency in the transmission and use of mechanical power. The possibilities of utilizing resonance are just beginning to be adumbrated. Every object, every cavity has its natural period or resonance wave form. Such form may be complex. In other cases the note may be simple. An archway, tradition tells us, may collapse under the continued playing of the keynote of the arch on an instrument like the violin. The rhythm of a regiment will vibrate a bridge to the breaking point The automobile at different speeds shows resonance at various points each characteristic of a given speed. So, too, vibrations are being applied for physical ailments.

As yet the entire field, from earthquakes to the as yet imperceptible oscillations of the insect world, are in an empirical, even legendary state. With the supermicrophone and amplifier the study of the sound spectrum of a given object or cavity set in vibration or resonance becomes possible. Any characteristic tone is thus reproducible by giving the harmonics their proper relative intensity. The field is thus wide open for the creation of a harmonic synthesizer capable of producing sounds of any possible tone quality or frequency.

Reproduction of Sound. Physical research has almost perfected the phonograph to the point where the distinction between the original rendering and the reproduction from the shellac disc is difficult. Astounding developments in this field have resulted from the application of acoustical physics, theoretical and experimental, to radio. The reproduction by means of a crystal is perfect but faint. The reproduction without the crystal still shows distortion and alone remains the incomplete link to the world-wide transmission of any sound, and its amplification without distortion to any volume. The field of acoustics has been furnished by physicists with precision tone producers, that is the production of clear monotone notes of a predetermined frequency.

Music. Seashore has measured the expression of emotion in music. He gives the types of variants from the cold non-emotional and mechanical production of tones to the highly artistic emotion on the basis of pitch, intensity, duration, and extensity, as they are combined in timbre, rhythm, consonance, and volume. The analysis is a behavioristic study of musical expression and should throw light on the basic laws of emotional expression.

Apparatus for Navigation. Acoustics has taken on new activities in such fields as submarine signaling. Eckhardt has devised a combination of submarine sound signals which are made to actuate a radio relay at several points on the shore. The radio relay signal reaches the ship almost instantly, the elapsed time giving the distance from each shore station. The relays give the exact location. The United States Navy by the use of echo detected by radio permits the sounding and the plotting of the ocean depths and the mapping of its profiles and contours. The "phonodeik" designed by Miller has opened up the subject of sound spectrum and given it a quantitative basis.

Modern Physical Science. The merging of the fields of astronomy, chemistry, and physics resulting from the invasion of physical laws, research methods, and the instruments of the physicist has been momentous for all three sciences. The extension of mathematical formulas into new fields is characteristic of present-day physics. Highly specialized formulas are found to hold good in fields foreign to those in which they were developed. Frank shows that the solution of the problem of guiding aircraft in minimum time with any arbitrary wind distribution involves an identical case to that of the passage of light rays through moving media. An example of the latter is the motion of the earth through the ether in which the ether wind relative to the earth is determinate by vector analysis. Aëronautics (q.v.) and aviation physics emerge as subjects of permanent interest, and meteorology (q.v.) has become of most practical concern in aviation so that wind speeds and directions at various levels are part of daily forecasts. The merging of hydrodynamics and aërodynamics is to be noted as a striking gain of recent work on hydroplanes and flying boats.

Physical Instruments. The new English *Journal of Scientific Instruments* is issued by the Institute of Physics in coöperation with the National Physical Laboratory. Science is recognizing the basic importance of instrument design and construction. Instruments make possible discoveries which could otherwise never be made. They accelerate, sometimes hundreds of times, the rate of gathering precise data. We may soon expect some physicist to do science the great service of writing a stimulating account of the place of the instrument in physics. This would doubtless inspire scientists and instrument makers alike in the production of new types of apparatus for experimental use. The *Journal of the Optical Society of America* has established an instrument section and added to its name the words "Scientific Instrument Review." Hitherto *Instrumentenkunde* has held the field unrivaled. America, now in the instrument field in full earnest, will surely take a high place in developing not merely new technical, but new scientific instruments as well, designed and built upon the most advanced scientific data and theory.

Precision Measurements. The use of interferometry in the production and testing of high precision shop gauges is an example in point, and on the horizon looms the "ultra-micrometer" of Wheddington and its improvement in America so that it will indicate lengths as slight as one billionth of an inch. Coblentz has greatly improved the sensitiveness of his star-heat apparatus which he expects will respond to the heat of a candle at a distance of 500 miles.

Extensometers of the most varied types and of high sensitivity have been developed. These are being applied to researches on materials and structures and the stress strain relations under loads. In optics the newer types of prisms are being applied to new uses, for example, the solid right angle prism, whose opposite face is an equilateral triangle, has interesting optical properties used in the War. The pentaprism and others are being applied in range finders while lenses, optical flats, and parallels are being developed in great variety for physical instruments.

Instrument making has at last arrived in

America, and American ingenuity is already in evidence in the later catalogues. Examples may be found in almost every branch of physics and applications in almost every branch of industry. In fact, the present tendency toward the completely measured control of industrial processes is almost without a parallel. Temperature and heat controls are now established in scores of industries. In many cases high temperatures are maintained automatically at predetermined values. The combustion of fuel is now automatically regulated in modern steam plants by means of apparatus which continuously and automatically corrects the admixture of air so that the CO content in the flue gases is kept at an optimum percentage.

These are examples of the instruments of the physicist becoming the tools of industry. Applied science is rapidly transferring the methods and principles and apparatus of the physicist into control instruments for the measured guidance of each part of the industrial process. In electricity the advance from the laboratory to practical uses has been rapid and steadily increasing. Electrical devices in endless variety are being developed for regulating the production, distribution, and utilization of heat, light, and power. Light buoys are being electrically equipped with selenium cells so that when the sky reaches a prescribed minimum brightness the buoy is lit automatically. Automatic heat control and humidity control are being extended to almost all kinds of manufacturing operations. The indoor atmosphere of schools and theatres is being conditioned by devices first used in the conduct of physical research.

Airplane engines are tested in altitude chambers where the conditions of high altitudes are duplicated. Testing laboratories are equipped with standard rooms having prescribed humidity and temperature so that the results may be comparable and standard. The vacuum tube has developed into a powerful engineering tool capable of sending messages to all parts of the world. In short, the variety of scientific devices developed by the physicist and transplanted to the industries is too great to enumerate The scientific journals and the latest instrument catalogues must be consulted for details which cannot be touched in this general survey.

A new era in astronomical research begins with the completion of the 100-inch reflecting telescope of the Mt. Wilson Solar Observatory. This wonderful instrument is uniquely adapted for work in the fields of faint nebula, spectra of faint stars, structure of stellar clusters, and the variation of faint new stars. The focal length, 42 feet, has a maximum error of 0.14 mm., or about one part in 90,000. The enlargement of the perceptible universe and the vast fields of research thus opened up by this 100-inch telescope make the event an epoch-making one.

Aëronautics Research. A most important and interesting development of applied physics in connection with lift, drift, and resistance of airfoils, is the midget wind tunnel consisting of a completely enclosed cylindrical tank with hemispherical ends. In this airtight tank, the air is drawn through an inner cylinder, returning outside the inner cylinder. By maintaining a pressure within the tunnel at 20 atmospheres, small-sized models give directly the results of a full-sized plane without scale corrections. This ingenious research shows the value of mathematical physics and the theory of similitude. At the other extreme of wind-tunnel physics is the giant wind tunnel at Issy, the fan of which is 20 feet in diameter. The tunnel measures 110 feet in length. The laws of aërodynamics have thus received accessions of an astonishing character, an important example being an American wind tunnel which gives air-speeds of 1000 miles an hour. In the latter the experts of the United States Bureau of Standards have studied the relative motion of the air and projectile with the projectile at rest.

As hydrodynamics and aërodynamics have merged in the hydroplane and the flying boat, so the internal-combustion motor may be fairly regarded as a large-calibre machine gun shooting the piston with a momentum which is promptly translated into traverse of aircraft. The problem of the helicopter is in like manner becoming assimilated to the circling of a plane with excellent prospects of yielding to ingenuity and careful application of physical principles.

Energetics. The importance of "available energy" is stressed by Lotka in a study of the energetics of evolution. He refers to Boltzmann's principle that the fundamental objective contention in the life struggle in the evolution of the organic world is available energy. The advantage in the struggle goes to those whose energy-capturing devices are most efficient in directing available energy into channels favorable to the preservation of the species. Intra-atomic energy, which is now well measured, and vast, is accepted by physics as a fact of profound significance for future experiment. Sober physicists discuss the possibility of its release for use by man.

The feeling seems to be growing that the reaction by which four hydrogen atoms detonate into one helium atom may be caused to proceed, and once started might be made continuous, much as the combustion of coal in a furnace. The weight of four gramatoms of hydrogen exceeds that of helium by three centigrams, corresponding according to the Einstein formula, to the liberation of 7×10^{12} calories. Harkins remarks that "the energy produced in this way would be of great importance if the reaction could be made to proceed, since one pound of hydrogen would give, if converted into helium, as much heat as 10,000 tons of coal." It is wise to face the possibility of success in this direction. Certainly with the concept of critical frequencies in photochemical reactions, the problem assumes the aspect rather of inciting exothermic combination of hydrogen molecules or atoms.

Foote, who has done so much valuable work on disrupting potentials, has discussed in a semi-popular lecture the subject of the alchemist. He pictures the success of the atomist transmuting the elements, pointing out that the production of gold from mercury on a commercial scale would cause an overturn of our entire monetary system. To the scientist, however, this is less important than the control of atomic structure in general. It is not easy to exaggerate the possible results of the discovery of the technique of nuclear formation and the addition or subtraction of electrons at will. It clearly presages the possibility of creating forms of matter and energy having any desired properties.

Wignall and Knox have written *Atoms*, a novel dealing with the release of subatomic en-

ergy, a straw showing the direction of current thought. The fact that subatomic releases of energy, for example, are actually observable in the phenomena of radioactive atoms and perhaps in the helium-hydrogen reactions of variable stars, kindles the scientific imagination. Young experimenters, who to-morrow will hold the field, have already grasped the possibilities and we may confidently expect a recrudescence of the zeal of the alchemist which made modern chemistry.

Physics was so productive in the 10-year period under review that only a few of the more important researches can even be named. It could be spoken of as almost the golden age of the physicist with the super forces and mechanisms at his command. The immediate future presages discoveries of the most far-reaching consequences. Fortunate is that physicist who sees with high and far vision the inspiriting view of the recreation of the world by the sciences touching the single cosmic essence which we call energy, the tangible aspect of which we call matter.

The literature on the new physics is growing so rapidly that any list would be out of date before reaching the reader. For the latest books in this prolific field the reader may consult the current numbers of *Science*, *Nature*, and *Science Progress*. See CHEMISTRY; CHEMISTRY, PHYSICAL.

PICARDY, BATTLES IN. See WAR IN EUROPE, *Western Front*.

PICCIRILLI, ATTILIO (1868–). An Italian sculptor (see VOL. XVIII). He designed the war memorial for the city of Albany, 1923. He was awarded a gold medal at the Panama-Pacific Exposition in 1915, and the Widener Gold Medal, the Pennsylvania Academy of Fine Arts, 1917. His brother Furio (see VOL. XVIII) in 1920 executed the entire sculptural decoration of the Parliament House at Winnipeg, Canada, including a superb seated statue of Pierre Gautier de la Varenne

PICKETING. In 1914, the Congress of the United States passed the Clayton Act which, among other things, provided that no restraining order may be granted by any Federal court or judge to prohibit labor, singly or in concert, from peacefully persuading others to work or to stop work or from attending any place where they may lawfully be. Labor regarded this as the opening of a new era in which the right of peaceful picketing would become generally recognized and accepted.

Prior to 1914, there were laws in only two States—Alabama and Colorado—making picketing a misdemeanor. Beginning with 1915, however, several States took vigorous action. Washington enacted a law making picketing a misdemeanor. Texas followed with a sweeping Act which provided that any one who in conversation or otherwise with a person engaged in transport and commerce, or with any member of his family, at work or at home, attempts to cause him to desist from work through fear of violence is deemed guilty of intimidation. A Nebraska law made practically any form of picketing unlawful, including persistent communication with a man's family. Hawaii also enacted a strict law against picketing. Utah, in 1923, passed a law against use of force, threats, intimidation or violence but an earlier law of 1917, limiting injunctions, forbids any injunction from interfering with peaceful persuasion. Wisconsin, in 1923, liberalized a law against picketing, which involved initimidation, by specifically allowing peaceful persuasion to be carried on outside the working premises during the strike or lockout.

Meanwhile, picketing cases found their way frequently into the courts. In some States all picketing was condemned, as in Oregon and Washington decisions of 1917. In other States, the right of peaceful picketing was held to be lawful, as in Arizona, Indiana, Minnesota and Montana decisions of 1916 and 1917 However, not only in directly deciding against picketing but also in indirectly limiting its practice through definition, the courts have as a general thing "gone against labor."

In 1922, the United States Supreme Court, in American Steel Foundry v. Tri-City Central Trades Council, upheld the provisions of the Clayton Act permitting peaceful persuasion but attempted to draw the line between legal and illegal acts in a way that would considerably limit picketing.

The most sweeping blow that was struck at picketing during the decade was the injunction secured in 1922, and made permanent in 1923 by the Federal court in Chicago, against the Railway Shop Crafts strike. The Attorney General brought this action on behalf of the United States on the ground of protecting the United States mails and interstate commerce. Although the Clayton Act authorizes peaceful persuasion, nevertheless this injunction, in addition to the customary prohibition of violence, intimidation and unlawful picketing, restrains peaceful picketing and persuasion, argument and entreaties, newspaper interviews and the use of union funds "in aid of or to promote or encourage the doing of any of the matters or things hereinbefore restrained and enjoined." The terms of this injunction against picketing, however, drew vigorous criticisms in decisions of other Federal courts in cases arising out of the railway shopmen's strike, particularly in Montana and North Dakota, where the full right of peaceful persuasion was reaffirmed.

PICKFORD, MARY (MRS. DOUGLAS FAIRBANKS) (1893–). An American actress, born in Toronto. She made her stage début at the age of five and her first marked moving-picture success in *Hearts Adrift*. She returned to the stage in *A Good Little Devil* and then devoted herself to the screen. Among her successes are *Tess of the Storm Country*, *Cinderella*, *Fanchon-Cricket*, *Madame Butterfly*, *The Bishop's Carriage*, and *Rosita*. Shortly before the War and for the succeeding years she has been one of the most popular screen actresses in the United States.

PICK-MANGIAGALLI, RICCARDO (1882–). An Italian composer, born at Strakowitz, Bohemia. He was trained at the Milan Conservatory under Appiani (piano) and Ferroni (composition). His earliest works were written under the influence of Wagner and Strauss, especially in regard to the handling of the orchestra. Later the influence of the French impressionists makes itself felt. His most important works are the ballets, *Il Salice d'Oro* (Milan, 1914), *Il Carillon Magico* (ib., 1918;

New York, 1920), *Mahit* (ib., 1923), and *Sumitra;* a symphonic poem, *Sortilegi; Nortturno e Rondo Fantastico* and two preludes, for orchestra; a string quartet; and several pieces for piano. An opera, *Baci e Botte*, was completed in 1920 but was not yet produced in 1924.

PICRIC ACID EXPLOSIVES. See EXPLOSIVES

PIERCE, GEORGE WASHINGTON (1872–). An American physicist, born at Webberville, Texas, and educated at the University of Texas, Harvard and Leipzig. In 1903 he became instructor in physics at Harvard and in 1917 full professor of physics and director of the Cruft Laboratory. During the War he conducted experiments at the Naval Experimental Station at New London, Conn. Among his more important researches were those connected with his experiments in resonance in wireless telegraph circuits and crystal rectifiers for electric currents and electric oscillations. In addition to many papers contributed to various scientific publications he is author of *The Principles of Wireless Telegraphy* (1910) and *Electric Oscillations and Electric Waves* (1919).

PIGMENTS. See LEAD.

PIKE, FRANK HENRY (1876–). An American physiologist, born at Aurora, Ill. He was educated at the University of Indiana and at the University of Chicago. He was instructor in physiology (1907–11) at the University of Chicago and assistant professor of physiology (1911–16) and associate professor (1916–) at Columbia University. Professor Pike published numerous articles on general physiology, on the eyes of Cuban cave shrimps, and on heredity.

PILES. See FOUNDATIONS.

PILOT CABLE. See NAVIGATION.

PILSUDSKI, JOSEPH (?–). A Polish general and administrator, born in Lithuania, and educated at Kharkov University He became a socialist, and in 1885, because of a false accusation of complicity in an attempt to assassinate Alexander III, he was banished. In 1893 he returned to Poland and helped to found the Polish Society party. At the beginning of the War, Pilsudski secretly formed the "Polish military organization" which was used in the struggle to free Poland from Russia and the Central Powers. In 1916 he resigned from the Polish army because of trouble with the Austrian commanders and was later arrested by the Germans and imprisoned at Magdeburg. When he returned to Poland in 1918, he found the government very weak, and on November 14 the Council of Regency abdicated. Pilsudski, backed by his army, then held supreme power. During 1919, the year in which Paderewski became prime minister, Pilsudski was engaged in wars with the Ukrainians, the Czecho-Slovaks, and the Bolsheviks. The last, although they came within 12 miles of Warsaw, retreated in disorder in the face of a violent counteroffensive led by Pilsudski In 1919 he was elected to the office of president, which he held till December, 1922. See POLAND, *History.*

PILTDOWN MAN. See MAN, PREHISTORIC RACES OF.

PINCHOT, GIFFORD (1865–). An American forester and public official (see VOL. XVIII). In 1920 he was appointed Commissioner of Forestry of Pennsylvania. He was nominated for governor in May, 1922, by the Progressive wing of the Republican party in the State and was elected in the following November. He was inaugurated as governor in 1923. During the threatened anthracite coal miners' strike in 1923, Governor Pinchot drew up a plan of settlement which was accepted both by miners and employers During the early part of 1923 he took an aggressive stand in regard to prohibition enforcement and severely criticized President Coolidge and the administration for alleged laxity in the enforcement of the law. Later in that year he undertook to bring about an investigation of the prohibition enforcement bureau of the Treasury Department through a Senatorial committee which was engaged in investigating other activities of that Department He was defeated as delegate to the Republican National Convention in May, 1924.

PINE BLISTER RUST. See PLANTS, DISEASES OF.

PINE SHOOT MOTH. See ENTOMOLOGY, ECONOMIC.

PINK BOLLWORM. See ENTOMOLOGY, ECONOMIC.

PINTNER, RUDOLF (1884–). An American psychologist, born at Lytham, England, and educated at the Edinburgh University and the University of Leipzig. In 1912 he removed to the United States and was for several years on the faculty of the Ohio State University. In 1921 he was professor of education at Teachers' College, Columbia University. He was the author of several books on psychology, including *The Picture Completion Test* (1917) and *A Mental Survey* (1918). He also translated several books on psychology

PIRANDELLO, LUIGI (1867–). An Italian author, born in Girgenti, well-known in the United States as a playwright. His *Six Characters in Search of an Author*, played in New York in 1922, provoked much warm comment. In this play he uses the most terrible of human emotions as his material and at the same time reveals æsthetic theories concerning the material of art He turns to life for his first inspiration, struggles in his works with the problem of personality, and strives to find the borderline between reality and fiction. His *Floriani's Wife* was played at the Greenwich Village Theatre in 1923 He is also the author of novels, among them *The Late Mattia Pascal.*

PIRQUET, FREIHERR CLEMENS, BARON VON (1874–). An Austrian pediatrist (see VOL. VXIII). During the War, von Pirquet devised a new notation for nutrition, intended to improve on the calory. The unit is termed the *ncm*, representing a cubic centimeter of mother's milk. He published *System der Ernährung* in 1917, with an addendum in 1920, devoted to this idea. In 1922 appeared in English *An Outline of the Pirquet System of Nutrition.*

PIRRIE, WILLIAM JAMES, first BARON (1847–1924). An Irish shipbuilder (see VOL. XVIII). During the War he was of valuable service to the British government as commercial adviser to Lord Derby, and in March, 1918, he was appointed Controller General of Merchant Shipping. When the North of Ireland was separated from the new Irish Free State, he was one of the first senators elected to the Parliament at Belfast (1922) Lord Pirrie was created a viscount in 1921 and died suddenly on May 7, 1924, on his way to New York City.

PISTOLS. See SMALL ARMS.

PITCHBLENDE. See RADIUM.

PITHECANTHROPUS ERECTUS. See ANTHROPOLOGY.

PITT, PERCY (1870–). An English conductor and composer, born in London. He studied under Reinecke and Jadassohn at the Leipzig Conservatory (1886–88) and under Rheinberger at the Akademie der Tonkunst in Munich. In 1896 he was appointed organist at Queen's Hall; in 1902, coach at Covent Garden; in 1906, assistant conductor; and after Messager's resignation (1907), principal conductor, a post which he filled until 1914. In 1920 he became principal conductor of the British National Opera Company. His works include a symphony; *Le Sang des Crépuscules,* symphonic poem; *Anactoria,* a symphonic poem for viola and orchestra; *Ballade,* for violin and orchestra; an overture, *The Taming of the Shrew; English Rhapsody, Oriental Rhapsody, Fêtes Galantes, Cinderella, Dance Rhythms, Coronation March,* for orchestra; incidental music to Phillips' *Paolo and Francesca,* Austin's *Flodden Field,* and Shakespeare's *Richard II; Hohenlinden,* ballad for male chorus and orchestra; *Sweyting the Saxon,* cantata; *Sakura,* ballet-pantomime; and chamber music, piano pieces and songs.

PITTMAN ACT. See SILVER.

PITTSBURGH. A city of Pennsylvania. The population increased from 533,905 in 1910 to 594,297 in 1920, to 625,915 by the estimate of the Bureau of the Census for 1924. The population of the metropolitan district of which Pittsburgh is the centre was 1,207,504 in 1924. The area of the city was increased by the annexation of Spring Garden in 1920 and Chartiers in 1921. In 1919 the city voted $21,996,000 for municipal improvements, as follows: highways, including the Boulevard of the Allies overlooking the Monongahela River, $9,579,000; subway, $6,000,000; parks and recreation grounds, $1,815,000; waterworks, $1,401,000; sewerage systems, $1,341,000; public health, safety, and charities, $1,110,000; highway bridges, $750,000. In 1919, a new bridge across the Allegheny River was designed to meet the requirements of the War Department and was completed in 1923. It comprised three steel arch-truss spans, 229 feet, 437 feet and 229 feet respectively in length. After investigation of the rapid transit conditions in Pittsburgh, the city transit commissioner in his report of 1917 recommended two projects. The first was to connect the South Side district with the East End, chiefly by elevated tracks, a distance of 7.28 miles, at an estimated cost of about $7,000,000; the second to connect the North Side with the East End, mostly by subway and tunnel at a cost of about $11,000,000. A twin tunnel, known as the Liberty Tunnels, 5700 feet long, extending under Mt. Washington and connecting the South Hills district with the business section of the city, was completed in 1923 at a cost of nearly $5,000,000. A zoning ordinance was passed in 1923. A bill passed by the State Legislature in 1923 authorized the appointment of a commission to study the creation of a metropolitan district in Allegheny County. The Schenley high school, accommodating 2000 pupils, was completed in 1916 at a cost of $1,500,000. Other large high school buildings recently completed were Langley high school, South Hills high school and Westinghouse high school. Peabody high school was greatly enlarged. The Carnegie Library grew from 418,698 volumes in 1914 to 536,975 volumes in 1924. A business-district branch was opened in the City-County Building in 1924 to accommodate the business section of the city. Pittsburgh manufactures annually products worth $2,500,000,000. Bank clearings rose from less than $3,000,000,000 in 1914 to $8,212,798,000 in 1923.

PITTSBURGH, UNIVERSITY OF. An institution at Pittsburgh, Pa., founded in 1787. With the exception of the war years, the university increased its enrollment with great rapidity between 1914 and 1922–23; from 2830 in the former year to 7786 in the latter. The faculty was increased during the same period from 329 to 585 members, and the library from 20,000 to 85,000 volumes. The income of the university also increased from $452,055 in 1914 to $1,437,333 in 1922–23. Alumni Hall was built through gifts of the alumni in 1920. John Gabbert Bowman, LL.D., succeeded Samuel Black McCormick, D.D., LL.D., as chancellor in 1921.

PIUS XI (ACHILLE RATTI), POPE (1857–). He was born in Desio, Italy, and studied at the diocesan seminaries and at the Lombard College of Rome, where he obtained a doctor's degree in theosophy, theology, and common law. He was ordained priest in 1879. From 1882 to 1888 he was professor of dogmatic theology and sacred eloquence in the seminary of his diocese. He afterward joined the staff of the Ambrosian Library, of which he became head in 1907. Four years later he was appointed assistant prefect of the Vatican Library and prefect in 1913. He was sent to Poland as Apostolic Visitor in 1918 and in the following year became Papal Nuncio. He was created Archbishop of Lepanto in 1919 and was transferred to the Archdiocese of Milan as Cardinal Archbishop in 1921. Following the death of Benedict XV, he was elected by the College of Cardinals as his successor and was crowned on Feb. 12, 1922.

PIZZETTI, ILDEBRANDO (1880–). An Italian composer, born at Parma, Italy. After receiving his first instruction from his father he entered the Parma Conservatory in 1895 and graduated with honors in 1901. In 1909–18 he taught composition at the Instituto Musicale in Florence, when he succeeded Tacchinardi as director. In 1924 he was called to succeed Gallignani as director of the Milan Conservatory. He wrote the operas, *Giulietta e Romeo, Le Cid,* and *Debora e Jaèle* (Milan, 1922); incidental music to Sophocles's *Edipo Rè* and d'Annunzio's *La Nave, Fedra,* and *La Pisanella;* a *Requiem* in memory of King Humbert; *Poema Emiliano; Overtura per una Farsa Tragica; Sinfonia del Fuoco; Lamento* for tenor and orchestra; a violin sonata, a 'cello sonata, and a string quartet; and piano pieces and songs. He also wrote many essays for various periodicals, a biography of Bellini (1916), and *Intermezzi Critichi* (1921).

PLAGUE. See BUBONIC PLAGUE; INFLUENZA.

PLANCK, MAX (1858–). A German physicist (see VOL. XVIII). He received the Nobel Prize for physics in 1919. His later publications include *Vorlesungen über Thermodynamik* (1921) and *Vorlesungen über die Theorie der Wärmestrahlung* (1921).

PLANTS, DISEASES OF. An annual plant disease survey of the United States was initiated in 1917. This survey was authorized by Congress and was carried on by the United States Department of Agriculture in coöperation with agricultural colleges, experiment stations, and various specialists in plant diseases, and it brought to light many new diseases, as well as old parasites on new hosts. There was also much study of the causes of diseases of plants and of means for their control. Among the diseases of great economic importance reported in the United States were citrus canker (*Bacterium citri*), potato black wart (*Chrysophlyctis endobiotica*), white pine blister rust (*Peridermium strobi*), take-all of wheat (*Ophiobolus graminis*), and flag smut of wheat (*Urocystis tritici*), all of which were introduced from other countries. The losses attributed to plant diseases in the United States were very great. According to estimates made by the Plant Disease Survey the losses of a few of the leading crops in 1922 were: wheat, 72,100,000 bushels; barley, 9,054,000 bushels; oats, 68,880,000 bushels, corn, 173,760,000 bushels; apples, 46,019,000 bushels; peaches, 10,547,000 bushels; and cotton, 916,980 bales.

The chestnut blight due to *Endothia parasitica*, which made its appearance in the vicinity of New York City about 1904, was probably introduced from Asia. It spread with great rapidity, and at the end of 1923 practically all the native chestnut trees in New England, eastern New York, New Jersey, Pennsylvania and Maryland had been destroyed, and the disease was spreading toward the South and West. Sporadic outbreaks of the fungus were reported from West Virginia, North Carolina and South Carolina. Occasional trees escaped where the fungus was prevalent, and this led to the hope of establishing varieties resistant to the blight.

Citrus canker caused by *Bacterium citri* was discovered in Florida and other Gulf States in 1916. This disease was believed to have been introduced from Japan, where it does comparatively little damage except to navel oranges. In the Gulf States it soon became very destructive, especially to oranges and grapefruit. Congress appropriated more than $1,700,000 for studies of this disease and means for its control. This sum was supplemented by State and other contributions, and the work on control was carried on coöperatively with the States where the disease occurred. Florida was most severely affected and many thousands of trees were burned. As a result citrus canker appeared to have been eradicated from the State, for no new infestations were reported in 1923. The same disease was reported in South Africa, where similar methods of control were applied with gratifying success.

The Plant Disease Survey found the black wart disease of potatoes caused by *Chrysophlyctis endobiotica* in Pennsylvania in 1917. Later it was discovered in a few localities in Maryland and West Virginia. This disease is believed to have been brought from Europe, where it is considered a serious trouble. All the localities where it was found in the United States are mining communities which are not important producing centres. Strict quarantines were established about them, and by the growing of immune varieties of potatoes it was hoped that the disease might be stamped out.

The white pine blister rust continued to be a subject of much concern not only to plant pathologists but to important industries dependent on the white pine and related species for timber. The fungus, *Peridermium strobi*, which causes this disease, has a complex life cycle. It spends different phases of its existence on the white pine and on currants and gooseberries. This parasite, probably introduced from Europe on white pine seedlings, was first reported in the United States about 1906. All the five-needle pines and most species of currants and gooseberries are subject to attack. The blister rust occurs quite generally throughout parts of New England and southern Ontario, and in parts of Minnesota and Wisconsin, with scattered infections on either white pines or currants in New York, Pennsylvania and Michigan. It was reported in Washington and British Columbia in 1922.

The fungus cannot infect pine trees from other pines but must pass through its alternate hosts, wild or cultivated species of *Ribes*. Advantage has been taken of this fact and control measures are based on the destruction of all species of *Ribes* occurring in the vicinity of white pines, and in the northeastern part of the United States about one-third of the white pine area has been cleared of currants and gooseberries at a cost of only about $.30 an acre. This method of control appears entirely practicable, and the cost is insignificant as compared with the value of the white pine timber of the country.

Another disease of great agricultural importance, in the control of which some progress has been made, is the stem rust of wheat due to *Puccinia graminis*. The relation of this fungus to the common barberry has long been known, and in some European countries attempts have been made to control the rust on wheat by the destruction of barberries in the vicinity. About 1918 an active campaign was begun in the United States for the destruction of all common barberry bushes in a number of the leading wheat-producing States. Since then Congress appropriated nearly $2,000,000 toward the expense of eradicating barberries in 13 of the North Central States, the work being carried on coöperatively with State officers. The bushes were grubbed out of the ground or destroyed by the application of coarse salt or arsenates about them. In this way many millions of barberry bushes were destroyed in the hope that by the removal of one of the alternate hosts, epidemics of rust infection would be avoided. Whether this will be successful is problematical, for recently spores of the form capable of infecting wheat were caught in spore traps exposed on airplanes at 7000 feet elevation, indicating the possibility of infection from regions where the uredospores retain viability throughout the winter. In connection with studies of the wheat rust problem, varieties of wheat have been found that are immune to the stem rust, and reliance on them seems to offer a means of control.

The so-called virus or mosaic diseases of plants took on importance, not only on account of their wide distribution and destructive effect but through the various hypotheses presented regarding their origin. These diseases are characterized by a certain dwarfing of the plants,

abnormal coloring and blotching of the foliage, and in some cases marked changes in the form and texture of the leaves. A considerable number of important crop plants are subject to attacks of this character, among them sugar beets, sugar cane, maize, tobacco, tomatoes, potatoes, beans, etc. In the case of the potato the disease manifests itself in a number of ways that have given rise to special names, such as mosaic, leaf roll, crinkle, streak, spindling sprout, etc., all of which are probably manifestations of a single disease. They are also called degeneration diseases from their effect on subsequent generations of infected plants. On some plants there is a distinct yellowing of the foliage, as in the peach, or a mottling as in the leaves of sugar cane, corn, tobacco, beans, cucurbits, etc. In the sugar beet the disease causes a curling and mottling of the leaves which produces a condition known as curly top. The cause, or causes, of mosaic diseases were not definitely determined. By some investigators they were called virus diseases, since the causal agent readily passes through a porcelain filter and sound plants may be infected by the introduction of the filtrate into their tissues. Others considered them to be due to organisms so minute as to escape detection by the best microscopes. Still others claimed they were due to protozoan parasites, and a number of investigators, following Lafont, who was the first to find protozoa in living plants, reported the presence of flagellates and similar bodies in diseased tissues, and causal relations were attributed to them.

Nelson reported in 1922 the discovery of protozoa-like bodies in plants affected with mosaic diseases. The accuracy of the determination was questioned, but in 1923 McKinney and his coworkers reported the occurrence of intracellular bodies in wheat plants affected with mosaic which are claimed to be stages in the life of some organism. Iwanowski reported such bodies in 1903 but did not associate them with mosaic, and Palm in 1922 considered them as possible causes of tobacco mosaic. In 1924 Kunkel added further evidence to their probable causal relations. He considered that at certain stages they may pass through a filter. So far as was known, there had been no disease successfully produced with cultures of these organisms, with the possible exception of that reported by McWhorter, who claimed to have produced the Figi disease of sugar cane by the introduction of cultures of amœba.

The means by which mosaic diseases are transmitted from plant to plant are quite varied. Perhaps the most are distributed by insects, mostly aphids, which act as mechanical carriers of the infection, but in the case of curly top of sugar beets the infective material must remain for a definite period in the body of a leaf hopper, *Eutettix tenella*. Some of these diseases are not limited to a single host plant but pass readily to unrelated species. A number are known to winter over on perennial weeds and infect crops the next season. Some are carried from crop to crop in the seed, while in the potato some forms of mosaic are undoubtedly carried in the tubers used for planting. Avoiding the use of infected material for planting, the growing of resistant varieties, of which there are many, and combating the insects that act as carriers are the most hopeful methods of controlling mosaic diseases of plants.

The number of diseases of plants caused by bacteria greatly increased between 1914 and 1924. There were probably fifty species of bacteria known to cause such diseases, and as some of them are capable of infecting a large range of plants, the total number of affected species is considerable.

Bibliography. Among the important books descriptive of plant diseases and their control were: W. F. Bewley, *Diseases of Greenhouse Plants* (London, 1923); E. J. Butler, *Fungi and Diseases in Plants* (Calcutta, 1918); F. J. Chittenden, *The Garden Doctor: Plants in Health and Disease* (New York, 1920); G. Delacroix, *Maladies des Plantes Cultivées* (Paris, 1916); P. Graebner, *Lehrbuch der Nichtparasitaren Pflanzenkrankheiten* (Berlin, 1920); J. W. Harshberger, *Textbook of Mycology and Plant Pathology* (Philadelphia, 1917); L. Mangin, *Parasites Végétaux des Plantes Cultivées* (Paris, 1921); G. Massée, *Diseases of Cultivated Plants and Trees* (London, 1915); W. Nowell, *Diseases of Crop Plants in the Lesser Antilles* (London, 1923); W. H. Rankin, *Manual of Tree Diseases* (New York, 1918); E. F. Smith, *Introduction to Bacterial Diseases of Plants* (Philadelphia, 1920); F. L. Stevens and J. G. Hall, *Diseases of Economic Plants* (New York, 1921); J. J. Taubenhaus, *Diseases of Truck Crops and Their Control* (New York, 1918); J. J. Taubenhaus, *Diseases of Greenhouse Crops and Their Control* (New York, 1920); N. Vavilov, *Immunitet Rastenii k. Infektionnym Zabolievanniam* (Moscow, 1919); and H. Welten, *Pflanzenkrankheiten* (Leipzig, 1919).

PLATINUM. Inasmuch as Russia was the chief source of the world's supply of platinum previous to the War, it was inevitable that in the 10 years between 1914 and 1924 many changes should develop in the mining and refining of this essential metal, which already had become more valuable than gold, as well as in its marketing. In 1912, the world's production of platinum was estimated at 313,529 ounces, of which amount 300,000 ounces was credited to Russia. At this time Colombia, which was destined to become an important source of production during the decade, produced 12,000 ounces, while between 700 and 800 ounces of crude platinum were produced in New South Wales and Tasmania and in the United States respectively. In the period between 1914 and 1924, there was an increased demand for platinum in jewelry, and during the War for use in the chemical industries. As early as 1914, an embargo was placed on platinum in Russia, and from that time the production declined, dropping from 241,200 ounces in 1914 to 50,000 ounces in 1917, and to probably about 25,000 ounces in 1918. The effect of this shrinkage was to reduce the world's production in 1918 to 62,283 ounces, which probably marked the lowest ebb in the production of this valuable mineral.

With the decline in production in Russia there was an increase in the output from Colombia, which by 1917 had increased to about 30,000 ounces, and by 1923 was estimated at 40,000 ounces. In the United States, where crude platinum was obtained from California and Oregon, with small amounts from Alaska, 721 ounces were produced in 1912 and this by 1923 had increased to 1008 ounces, though in the following year there was a decline to 609 ounces,

of which Alaska produced 7, California 578 and Oregon 24 ounces.

Inasmuch as it was so essential as a war material, the United States in 1918 commandeered all available crude and refined platinum at a maximum price of $105 an ounce. This metal was very necessary for the various chemical industries that were active in the manufacture of explosives and other war munitions, and the government was able to accumulate adequate supplies. On Dec. 1, 1918, when the market was set free, and early in 1919, the government stocks were released. From that time on platinum underwent a series of violent fluctuations, being quoted at the end of 1919 at from $150 to $155 an ounce, while in the following year it reached a maximum monthly price of $154.23. In 1920, the price declined, and in the following year a minimum monthly average of $70.227 was recorded, from which there was a recovery so that in the year 1923 the average for the year was $116.537. The average prices from 1914 to 1923 are summarized in the table following:

AVERAGE MONTHLY PRICES OF PLATINUM, NEW YORK MARKET [a]

Year	Price	Year	Price
1914	$ 45 14	1919	$114.61
1915	47 13	1920	110.90 [b]
1916	83 40	1921	75 033 [c]
1917	102.82	1922	97.618
1918	105 95	1923	116 537

[a] From *Engineering and Mining Journal.*
[b] Maximum monthly average $154 23.
[c] Minimum monthly average $70 227

In the United States, the considerable consumption of platinum has to be met by extensive imports, though some is obtained from the refining of gold, copper and nickel ores (see accompanying tables).

NEW PLATINUM METALS RECOVERED BY REFINERS IN THE UNITED STATES, IN TROY OUNCES

Year	Platinum	Palladium	Iridium	Osmiridium	Others	Total
1919	40,220	3,807	401	402	279	45,109
1920	36,015	4,309	418	409	393	41,544
1921	51,791	2,686	286	581	1,026	56,370
1922	54,142	1,943	210	1,301	122	57 718
1923	46,780	1,934	280	787	16	49,797

SECONDARY PLATINUM METALS RECOVERED IN THE UNITED STATES, IN TROY OUNCES

Year	Platinum	Palladium	Iridium	Others	Total
1919	54,545	3,467	3,504		61,516
1920	51,255	3,100	3,355		57 710
1921	39,131	4,887	1,776	229	46 023
1922	40,062	4,193	1,937	496	46,688
1923	39,152	6,246	2,021	453	47,872

IMPORTS OF PLATINUM AND PLATINUM METALS INTO THE UNITED STATES

Metal	1922 Troy ounces	1922 Value	1923 Troy ounces	1923 Value
Platinum or crude platinum and unmanufactured products, ingots, sheets, wire, etc.	94,939	$7,790,898	86,417	$8,923,037
Platinum, manufactured products, vases, retorts, etc.	[a] 45	[b] 11,464	103	4,769
Iridium	1,899	298,567	1,611	276,539

PLATONISM. See PHILOSOPHY

PLATOON SCHOOL ORGANIZATION. See EDUCATION IN THE UNITED STATES.

PLAYGROUND AND RECREATION AS-

SOCIATION OF AMERICA. An organization founded in Washington, D. C. in 1906. Its work for the development and improvement of playgrounds and neighborhood recreation schools continued actively during the decade 1914–24 Through the employment department of the Association, many officials have been enabled to select workers of training and experience. During the War, the Association sent community organizers into each of the cities near the training camps to organize social and recreational life for the benefit of the soldiers in their free time. This was known as the War Camp Community Service, and over 400 community organizers were at work in it. As a result of these activities men in the service were given home hospitality, community singing, athletic activities, and automobile rides. Entertainment was provided through soldiers' and sailors' clubs in practically all the cities of the country. During 1919 the Association sent field workers to the communities desiring their services, to help plan the work and to secure municipal appropriations. There was also inaugurated in that year the National Physical Education Service to assist States in securing adequate compulsory physical education laws and to work for these laws. This work continued during 1920, and as a result legislation and appropriations were secured in many States and cities for recreational purposes Special effort was made in 1921 for the passage of a Federal physical education bill A continuation service, established in 1921 and continued in 1922 and 1923, proved itself of value by giving help and advice on recreation problems to many cities already having recreational systems. The ninth recreation congress was held in 1922 and was attended by over 600 delegates. The Community Service department assisted local community service committees in several cities in training representative groups of citizens who, in a volunteer committee or association, helped to build up neighborliness and community spirit. During 1923 the association aided approximately 200 communities by conducting summer playgrounds and municipal year-round systems through the service of its continuation field secretaries. It gave further service by helping to secure, in five States, home-rule bills giving cities power to establish year-round recreation systems. Many pamphlets, handbooks, and bulletins were issued Over 500 delegates attended the Tenth Recreation Congress held in Springfield, Ill. The 1924 recreation congress had its meeting October 16–21 at Atlantic City, N J The association publishes a monthly magazine entitled *The Playground.* As a result of the efforts of the organization, 32 States had physical education laws in 1923 The president in that year was Joseph Lee.

PLOWING. See FARM TRACTOR.

PLUMER OF MESSINES (HERBERT CHARLES ONSLOW PLUMER), first BARON, (1857–). A British soldier. He entered the army in 1876 and served in the Sudan and South Africa, where he commanded a corps of mounted rifles. He took part in the South African War from 1899 to 1902 and in the latter year was promoted to be major-general He became lieutenant-general in 1908 and held various important commands in 1914. In 1915 he was made commander of the 5th Army Corps in France and from 1915 to 1917 was commander of the 2d Army. He was promoted to general in 1916. From November, 1917, to March, 1918, he commanded the Italian Expeditionary Force, returning in the latter year to France to resume command of the 2d Army, which he held until the close of the War. After commanding the Army of the Rhone, he was appointed Governor of Malta in 1919. Later in the same year he was promoted to field marshal. He received many decorations from foreign governments

PLUNKETT, SIR HORACE CURZON (1854–). An Irish statesman (see VOL. XVIII). During the agitation in Ireland following the rebellion of 1916, he labored diligently to bring about an understanding with the British government. In 1917–18 he was chairman of the Irish Convention. In 1923 he visited the United States in the interests of the Irish Free State, and during his absence, his home was burned by an Irish republican mob. He wrote *A Better Way: An Appeal to Ulster not to Desert Ireland* (1914), and *Some Tendencies of Modern Medicine* (1918).

PNEUMONIA. The pandemic of influenza and pneumonia and the prevalence of measles among the recruits in the United States Army with the high incidence of bronchopneumonia as a sequel, brought home to the public the ravages which these secondary pneumonias may inflict upon the world Much of the death rate of bubonic plague is due to primary and secondary pneumonia and the latter is the principal agency of destruction in whooping cough. Aside from this group of diseases bronchopneumonia is chiefly a malady of the very young and very old. On account of the secondary and complicating nature of this type of pneumonia, it is impossible to direct any special preventive measures against it and owing to the great volatility of the infectious principle in influenza, whooping cough and measles, it is impossible to prevent their spread.

Ordinary seasonal pneumonia, which attacks the young and middle aged as well as the old, has been studied intensively in the Rockefeller Institute and it has been found that the fatal outcome is due largely to a specially deadly strain of the pneumococcus, while other strains have a considerably lower mortality or are more amenable to treatment.

In May, 1924, Dr L. D. Felton, working in a Harvard University laboratory under the auspices of the Metropolitan Life Insurance Company, announced the discovery of a serum, which had been freely tested in various types of pneumonia with an apparent reduction of mortality of from 25 to 50 per cent of those treated Unlike various similar announcements made from time to time, this one had the indorsement of several conservative pathologists and health officers. It is of special significance because such a serum can be applied in any pneumonia without awaiting a bacteriological diagnosis See also INFLUENZA

POINCARÉ, RAYMOND (1860–). A president of France (see VOL. XVIII). In August, 1914, at the outbreak of the War, President Poincaré, by a great speech appealing to the patriotism of the French lawmakers, brought about the formation of a political *union sacrée* which maintained the Viviani cabinet in power for several years, until accumulation of the country's misfortunes and discontent with the prosecution of the War overset it, and Viviani gave place to Briand. Poincaré

at all times urged vigorous prosecution of the war, and after the Armistice he insisted that there should be no relaxation of the terms of the Treaty of Versailles for Germany. To insure payment of reparations he caused the occupation by French troops of Germany's most important industrial area, the Ruhr. In 1920 his term of office as president expired, and in 1922 he was asked by President Millerand to form a cabinet. He held the post of premier until 1924, when he was succeeded by Herriot.

POINDEXTER, MILES (1868–). An American legislator and diplomat (see VOL. XVIII). He served in the United States Senate from Washington from 1911 to 1923 but was defeated for reëlection in 1922. In 1923 President Harding appointed him Ambassador to Peru.

POLAND. A European republic erected by the Treaty of Versailles in 1919. Poland has an area of 149,140 square miles, the principal sections being Congress Poland (formerly Russian Poland), Posen, Pomerania, Galicia, Upper Silesia and Vilna, and a population estimated at 29,845,714 in 1923, of which 65 per cent was engaged in agriculture, 14 per cent in mining, and the balance either in trade or other pursuits. As for religion, the population was preponderantly Roman Catholic, other religions being the Greek Catholic, Jewish, Russian Orthodox, and Protestant. The Polish language was spoken universally. The principal towns, with their population, are: Warsaw, 931,000; Lodz, 452,000; Lemberg, 219,000; Crakow, 182,000; Poznan, 170,000; and Vilna, 160,000. There were in 1924 six universities and two national polytechnical institutes in Poland, the principal universities being located in Warsaw, Crakow, Lemberg (Lwow), and Posen. The polytechnical institutes were located in Lemberg and Warsaw. After the War, Poland had about 10,000 public schools with an enrollment of about 2,000,000 students. In addition, the educational system included 623 high schools. There were also two academies of fine arts in Warsaw and Crakow.

Agriculture. Out of a total of 42,000,000 acres of arable land, 37,791,000 acres were under cultivation in 1923. The principal crops, based on a five-year pre-war average from 1909 to 1913, and for 1922 and 1923, are shown in the following table, with figures in thousands.

	Sowings Area in hectares			Crops Metric tons			1923 Per cent of pre-war	
	1909–13 average	1922	1923	1909–13 average	1922	1923	area	crop
Wheat	1,353	1,046	1,017	1,704	1,160	1,354	80	80
Rye	5,087	4,578	4,665	5,749	5,066	5,962	93	104
Bread grains	6,440	5,623	5,662	7,433	6,226	7,346	89	98
Barley	1,265	1,147	1,199	1,517	1,304	1,655	99	109
Oats	2,749	2,404	2,515	2,051	2,548	3,622	92	121
Potatoes	2,644	2,234	2,279	25,300	33,754	26,494	95	105
Sugar beets	178	109	136	4,828	2,671	2,577	76	54

Poland was self-sufficient in major food products, and exported considerable quantities of grain, potatoes, sugar, alcohol, and eggs. There were many large land holdings in the country, but these were gradually being broken up into small farms through the agrarian reform movement, and through force of necessity, brought about by high taxation. The live stock census for 1921 showed: horses, 3,201,166; cattle, 7,894,586; sheep, 2,178,216; hogs, 5,170,612. The rate of increase after 1921 was believed to be abnormally high, due to very cheap fodder and the reluctance of farmers to sell for depreciating currency. About 25 per cent of Polish territory was covered by forests, or approximately 25,000,000 acres. The biggest and finest forests were in the eastern part of Poland. There was also the famous Bialowiez reservation, which covers about 600,000 acres. The government itself owned several million acres of forest lands, with an approximate value of one-half billion dollars, which was more than the combined internal and external debt. There were also large forests in the Carpathian mountains, in some districts covering more than half of the total area. The principal varieties of trees found were oak, ash, pine, spruce, and pitch pine There were 3000 sawmills engaged in the lumber industry in 1914, and in 1923 this number had declined to 1243, with a capacity of 6,500,000 cubic meters annually.

Mining. Through the acquisition of Upper Silesia in 1922, Poland became the possessor of one of the richest mining sections of Europe and from an importer of coal became an exporter. The estimated reserve was put at 63,000,000,000 metric tons. Coal production for 1923 was 36,097,997 metric tons, and exports were 12,912,792 metric tons. Of iron ore, there was an estimated reserve of 300,000,000 tons of 27 to 32 per cent ore, located principally in Silesia. There were also large areas of zinc and lead in Polish Silesia, the country ranking sixth in the world production of these minerals. The principal salt mines were located in Galicia and the reserves of this commodity were considered inexhaustible.

Industry. The section of Poland formerly belonging to Russia was one of the principal manufacturing sections of that empire. The principal industries in approximate order were: textile, heavy iron and steel, petroleum refining, zinc, lumber, machinery, chemicals, sugar, glass, cement, leather, alcohol, paper, and starch. The city of Lodz was the centre of the textile industry, with an estimated annual capacity at normal operation of 80,347 tons of cotton yarn, 82,000 tons of wool yarn, 78,740 tons of cotton fabric, and 27,300 tons of wool fabrics. The metallurgical industry production for 1923 was: blast furnaces, 288,000 metric tons; steel works, 1,043,000 metric tons; rolling mills, 732,000 metric tons Poland was one of the principal petroleum-producing countries of Europe, the oil-bearing land being located in the province of Galicia. The industry fell off considerably after the War, refinery for 1923 being 603,190 tons. Total petroleum production for 1923 was 737,000 metric tons, as compared with 1,114,000 tons in 1914. Reserves of petroleum were

estimated at 200,000,000 tons, there being 1900 wells producing in 1923.

Communication. Poland possessed a very well-developed railway system, but due to the depreciation of the currency after the War, railway tariffs, not having been adjusted as exchange fell, were not maintained at their old standards. Nearly all lines are state-owned and operated. Total of standard trackage in Poland, 16,653 kilometers: locomotives, 4593; passenger cars, 11,733; freight cars, 129,722. The railroads were operated at a deficit during 1919–24, and for 1923 constituted the largest single item contributing to the total government deficits. Railroad tariffs were, later, put on a gold basis and their budget separated from the general government budget so that the country regarded improvements as imminent. Poland had practically no merchant marine and was dependent for port facilities upon the Free City of Danzig, on the Vistula. The vessel tonnage entering Danzig in 1922 was 1,414,000; cleared, 1,437,000. One-half of the total area of Poland is located in the drainage basin of the Vistula River, which is one of the most important waterways in Europe Rising in the Carpathian mountains, in the extreme south of Poland, this river flows through the great Polish plain and enters into the Baltic Sea. Approximately 650 miles in length, the Vistula drains over 75,000 square miles of territory. With but two exceptions, the larger cities of Poland were situated on the Vistula River and its tributaries. River transportation, however, fell off considerably after 1919. The water-power resources of Poland were very great. It was estimated that 1,000,000 horse power could be developed. Sixty per cent of this was in the province of Galicia. In 1922, Poland had 44,406 kilometers of telegraph line, and 166,744 kilometers of wire, and 34,000,000 messages were sent during the year. In 1922, there were 1363 telephone centrals, 58,103 kilometers of line, and 364,654 kilometers of wire.

Finance. Conditions of currency inflation, which prevailed in Poland from the date of the Armistice, reached their climax in 1923, leading at the close of the year to basic fiscal reforms, the most important of which was the placing on a gold equivalent basis of payments to the government of taxes and other public charges In addition, a new bank of issue was created, to be independent of the government, but in which the government was to be a minority stockholder. The new currency was to be gold backed and the unit was to be the zloty, the dollar equivalent being $0.193. On Mar. 20, 1924, the number of Polish paper marks in circulation was 522,000,000,000. This was being replaced by the new zloty currency as rapidly as circumstances would permit. The rate of exchange of the old Polish mark for the new currency was fixed at 1,800,000 marks for one zloty. The old Polish mark ceased to be legal tender on July 1, 1924, and was to be invalid for exchange for new currency after May 31, 1925. Currency depreciation, which first rose from government deficits, was accelerated by the loss of public confidence, causing the Polish mark to depreciate to 9,350,000 to the dollar in February, 1924, at which point the financial reforms already outlined caused it to become practically stabilized. The national indebtedness of Poland on Dec. 31, 1923, was: internal debt, interest bearing, 182,932,800,000 marks and 16,400,000 zloty, plus the non-interest bearing debt to State Loan Bank which, on Feb. 1, 1924, was 291,700,000,000,000, equivalent to 162,000,000 zloty at the rate of 1,800,000 marks to the zloty. The per capita internal debt was really 68 cents, and was said to be lowest in Europe. The foreign indebtedness of Poland consisted of the following loans: United States, $184,434,339 (principally for famine relief); Holland, 14,218,687 florins; Sweden, 935-805 cronen; Norway, 16,497,417 cronen; Great Britain, £4,530,818; Switzerland, 17,600 francs; Denmark, 359,849 cronen; France, 912,455,222 francs; Italy, 75,000,000 lire. These figures were as of Jan. 1, 1923 After that date there was a large military loan from France.

Commerce. Statistics on Polish foreign trade, prior to 1922, were not available and, even though they were, would not form a correct basis of comparison for data from that date on, due to the acquisition of Upper Silesia in that year, with its pronounced effect on the foreign trade of the country. The outstanding feature of the Polish foreign trade of 1923 was a 32 per cent increase in the value of imports and an 83 per cent increase in the value of exports, and the favorable balance of trade for the latter year, as compared with the adverse balance in 1922. By far the most important country in Polish foreign trade was Germany which, in 1923, furnished 43 per cent of total imports (1922, 37 per cent) and took 60 per cent (1922, 49 per cent) of exports. The United States was also an important factor in Polish import trade, due to cotton shipments, which in 1923 totaled 43,344 tons out of a total of 57,568 tons, valued at $30,000,000. The following table shows the value of Polish foreign trade for 1922 and 1923 by principal divisions.

POLISH FOREIGN TRADE

	Value—1000 gold francs				Quantity—metric tons			
	1922		1923		1922		1923	
	Imports	Exports	Imports	Exports	Imports	Exports	Imports	Exports

[a] head.

Defense. Poland employed universal military service for all male adults. Active service in the army was for two years, which was to be followed by periods of service in the reserve forces of the country. There were nine military districts with headquarters at Warsaw,

Lublin, Kielce, Grodno, Posen, Pomerze, Crakow, Lemberg, and Lodz. The 1924 army, on a peace-strength basis, numbered 275,000 men. There were 30 divisions of infantry and 10 brigades of cavalry. The war-time strength of the army was put at over one million. The naval forces of Poland were very small, consisting of six small cruisers and gunboats, five monitors, and a number of smaller vessels which were used for police and customs service.

History. From the middle of the nineteenth century, after the ill-starred Polish Revolutions, Russia applied herself sedulously to the task of breaking the spirit of Polish nationalism. The policy of Russification not only implied insistence upon the use of the Russian language as well as movements against the Catholic Church, but, more insidiously, by the encouragement given the peasants and the Jews, it aimed at a division of sentiment in Poland itself. The peasants were emancipated in 1864 and were given a share of political power by the creation of the local communes. This strategy might have succeeded if Poland had remained an agricultural country; but the coming of the industrial revolution to the Russian provinces gave impetus to the growth among the new proletariat of a socialism strongly tinged with nationalism. In the Russian Duma, after 1905, this socialist opinion was strongly expressed, and though, in the next decade, the appearance of an anti-German propaganda split its forces, it continued down to the War to exert a powerful influence By 1914, of course, Russian or Congress Poland was not singleminded in its purposes Many Poles gravitated to Austria, some toward Germany, and some toward Russia, while a large number still clung to their nationalistic aspirations. In Galicia, i.e. Austrian Poland, the problem was a different one The Austrian government, always more lenient than its northern neighbor, sought to gain the adherence of the Poles by a policy of studied kindness Poles acquired a large representation in the Austrian Reichsrat, were permitted the use of their tongue in the schools and law courts, and were placed in control of the administration of Cracow and Lemberg universities. As land and local administration, as well as higher education in Galicia were largely in the hands of the Poles, the latter became the oppressors of the Jewish and Ruthenian (or Ukrainian) minorities, by whom they were most cordially disliked. After 1890, the Austrian government, pursuing its time-honored strategy of "divide and rule," gave more or less covert encouragement to Ruthenian nationalist agitation, with the result that no inconsiderable number of Galician Poles became Russophiles because of their hostility to Ruthenian nationalism, while others, conscious of their favored position in Galicia, remained pro-Austrian. In Prussian Poland a different development had created other sympathies. By 1870, the Poles here had entrenched themselves so firmly economically that a move on them virtually meant the uprooting of the life of the whole country. Many of the Poles in Posen and West Prussia, unlike their kinsmen in Russian Poland and Galicia, were the successful members of the middle class, and aided by money and power had created a strong nationalistic sentiment. Beginning with 1872, Bismarck's campaign of Germanization moved on two wings. By the programme known as the *Kulturkampf* he sought to suppress Polish culture through the persecution of the Catholic Church and the elimination of the Polish language, and by economic methods, i.e the settlement of German colonists in Poland and the purchase of Polish land, he aimed at breaking down the Polish supremacy. Neither move succeeded. The Poles thrived in spite of official animosity and through the agencies of coöperative societies and political and social clubs maintained their economic preponderance as well as their nationalistic unity. Thus the German Poles were almost completely mobilized for political independence by 1914

There was thus, when the War broke out, no common sentiment to hold the loyalty of all the Poles One group gravitated toward Russia in the hope that autonomy might be granted under the Russian crown, another, under M. Pilsudski, looked to Austro-German aid for the erection of a republican Poland that could serve as a buffer state against the Russian advance. A Polish legion was formed and it was offered to Austria But the Austrian suspicions of Pilsudski's republican-socialistic pretensions, together with the continual fighting in Galicia, forestalled a definite pronouncement of policy. However, in November, 1916, realizing that such a state would serve mightily their purposes on the Eastern front, the Central Powers combined to recognize the independence of Russian Poland. Galician Poland was merely given autonomy. Poland, in the ensuing years, was under German domination. The governor-general was German while the ruling council was selected by both governments. The council, for a time, in 1917, gave surprising manifestations of an independent spirit, but it was soon overawed by Germany. Under German occupation all opposition was crushed. The Austrian Poles, who demanded a real Polish state, were suppressed; Pilsudski, always a dissident force, was arrested and the Polish legion was used merely as an auxiliary of the German army. Now that Russia was no longer a menace, Polish hopes could be conveniently disregarded. The Poles were refused admittance to the discussions at Brest-Litovsk and were compelled to see the disputed district of Kholm turned over to the new Ukrainian Republic. Not until the close of the War did the hope of an independent Poland definitely materialize. In October, 1918, a National Polish Diet met, while at the same time the Austrian Poles quit the Reichsrat to assemble at Crakow. In November, Pilsudski was released by the German revolutionists and appeared in Poland to aid in the work of restoration. Meanwhile a Polish army, recruited in the United States and other countries, and recognized as a national unit by the Allies, had been fighting on the western front, while the Polish National Council, stationed at Paris, kept the Polish aspirations before the French, British and Italian leaders.

From Nov. 14, 1918 on, Pilsudski was invested with the full powers of a dictator. His known radical sentiments for a time threatened to disrupt Polish unity, and had it not been for his political astuteness the problem of creating a Polish state might have been well-nigh insuperable. But the conservatives were won over by the appointment to the premiership of M. Paderewski, the pianist, who stood high in the favor of the Allies as a result of his work with the Polish National Council. A Constituent

Assembly was next provided for and this body met at Warsaw on Feb. 9, 1919. Something of the divergent loyalties in the new nation may be gauged from the political grouping. There were, here, 91 National Democrats, 51 Polish Peasants, 19 Peasants' Union, 14 Socialists, 7 Workmen's Union, 8 Jewish party, 6 United Polish Peasants, 2 German Colonists. A Conservative bloc supported the Paderewski government. The problems before the administration were complex enough to try the strongest minds. The marking out of the frontiers in accordance with the Peace of Versailles and to the satisfaction of the Polish nationalistic aspirations led to a whole series of minor struggles in which, at one time or another, Poland saw herself engaged with almost all her neighbors; while the erection of a constitution, the economic rehabilitation of the country, the problem of racial minorities, in particular the Jewish question, all brought in their wake domestic difficulties of the most serious import. These matters must all be considered in some detail.

The peace treaties, as brought back to Poland in 1919 by M. Paderewski, made the following provisions: on the west and north the boundary followed fairly closely the ethnographic frontiers; the greater part of Posen and part of West Prussia were granted to Poland, while the disposition of Masuria and Upper Silesia was made to depend upon plebiscites. Danzig (q.v.) was made a Free City, though the "corridor" and the administration of the Vistula River were to be turned over to the Poles In the south, by a supplementary treaty signed on Aug. 10, 1920, Poland received West Galicia, with a slightly readjusted southern frontier. Eastern (Ruthenian) Galicia was to be provisionally assigned to Poland for a term of years. On the east no definite frontier was established by the treaties, owing to uncertainty regarding Russia's future status; but the Peace Conference merely recommended a tentative minimal eastern boundary, based largely on linguistic statistics, leaving details to be settled by Russia and Poland subsequently. Furthermore, the Peace Conference required Poland to sign a minority treaty, June 28, 1919, which provided for religious freedom; equal civil and political rights for all inhabitants regardless of race, language, or religion; and freedom of transit on Polish waterways and railways for Allied Powers. The number of hostilities in connection with the peace settlement was really astounding. With Czecho-Slovakia a dispute arose over the disposition of the border districts of Teschen (q.v), Zips, and Orava, and some fighting actually took place in January–February, 1919. The first, Teschen, occupied a peculiar importance, having rich coal and iron deposits as well as an important railway running through the heart of the district. In the west, the population was Czech, in the east, Polish The wrangling dragged on over a year until finally, by the intervention of the Council of Ambassadors in the middle of 1920, an agreement was reached whereby most of the coal mines and the railway were given to Czecho-Slovakia, while the city of Teschen was left in Polish territory. By the same decision the other two districts were similarly divided, the greater proportion of each going to Czecho-Slovakia With the Ruthenians in Galicia, war broke out, too, in 1919. The conflict was waged intermittently, attacks being sporadic and on defenseless populations as a rule. The Jews of Lemberg, in particular, suffered at the hands of the Poles. Not until April, 1920, did hostilities cease. By the agreement reached Poland gained de facto possession of East Galicia. It was the war with Russia, however, that occupied most of Polish attention and diverted consideration from the more pressing domestic problems. Egged on by the French, but as much motivated by her own nationalist ambitions, Poland, early in 1920, after some fighting in the previous year, launched a large-scale offensive against Russia. Her aim was to establish the frontier of 1772, and having gained the Ukraine as an ally, the moment was deemed propitious for the realization of the Polish hopes. Allied preoccupation elsewhere, and the desire on the part of the French to use Poland in a "sanitary cordon" against Bolshevism, gave spur to the adventure The Poles pressed forward for more than 300 miles, took Kiev in May, 1920, and threw their line south into the northwestern Ukraine. A Russian counteroffensive, however, soon swept the Poles back to Warsaw's gates (August, 1920). Only the severity of the terms proposed by the Russians prevented the closing of the war with a Russian victory. Confronted by a desperate situation, Poland turned at bay and, aided by French leadership and Allied munitions, once more resumed the attack. The Russians had pressed too far beyond the lines of their communications. By the end of August the Russians were in retreat and General Pilsudski had reached the line held by the Germans in 1918 on the eve of Brest-Litovsk. In the Peace of Riga, which followed on Oct. 12, 1920, the terms exacted by the Poles were surprisingly favorable. The eastern boundary was fixed far beyond the line recommended by the Peace Conference in 1919 and contained the cities of Pinsk, Kovel and Rovno; an indemnity was to be paid Poland; the Galician line was recognized; Lithuania was to be cut off from Russia, by a narrow arm of Polish territory extending north as far as Latvia. The treaty brought to a head another difficulty in which Poland was involved. During 1920 there had been some fighting between Poles and Lithuanians over the disposition of Vilna and the Suwalki region southwest of Vilna. The evacuation of Vilna by the Bolsheviks during the course of their retreat east in August, and the terms of the Riga treaty, intensified the struggle with the result that on October 9 General Zeligowski appeared in the city with an irregular military force, and, though unauthorized by the Polish government, drove out the Lithuanians and claimed the section for Poland Settlement by means of a plebiscite under League supervision was proposed, then abandoned, by the League; but, thanks in part to pressure from the League, Zeligowski withdrew from Vilna and elections for a local Diet were held in the disputed district in January, 1922. The Diet immediately voted for union with Poland, in February, whereupon the Polish parliament resolved (March 24) to annex Vilna, and the formal incorporation of the district into Poland occurred on April 18. Once more, as in so many other cases, the Allied Council of Ambassadors acquiesced in a fait accompli, and in March, 1923, fixed the northeastern frontiers of Poland in such a manner as to include Vilna, despite vehement Lithuanian protests. Thereafter, however, Poland

and Lithuania continued to quarrel over the division of a "neutral zone" which had been established between the two countries (See LITHUANIA.) Danzig, too, was the seat of trouble. Not content with the treaty provisions made for the Free City, Poland continued to agitate for a greater Polish control and in November, 1920, Paderewski, before the League Council, sought the right to police the city with Polish military. This demand was occasioned by the unfriendly attitude toward Poles in Danzig but more particularly by the fact that munitions for Poland, during the Russian war, had been held up by the port authorities Not until Oct. 25, 1921, did Poland consent to sign an agreement with Danzig and accept the Allied terms. (See DANZIG.) Much more serious was the conflict with Germany over the division of Upper Silesia (q.v.), described in another place.

It is thus evident how stormy was the early career of Poland. The consideration of the new constitution necessarily languished and it was not until Mar. 17, 1921, that the document was finally completed. It provided for a bicameral parliament (Seym), a responsible ministry, and a president elected for seven years by the parliament. Roman Catholicism was made the state religion though all other faiths were given freedom of worship Labor was officially recognized. State insurance against unemployment, illness and accidents was promised. A section modeled after the German constitution provided for the erection of local economic organizations, to centre eventually in the Supreme Economic Chamber of the republic The conduct of foreign affairs and the increasing economic instability were responsible for the frequent political crises. Paderewski fell from power Dec. 7, 1919, and 1920 saw two different cabinets. Radical disorders in Warsaw and Galicia and the continual turbulence of the Socialist and Workmen's members in the Assembly added to the general uneasiness. In 1921, the war ministry of MM Witos, Grabski, Skulski, and Daszynski resigned and was succeeded by a government headed by M. Ponikowski, which, in 1922, underwent a reconstruction. However, the new ministry lasted only four months, for in June, 1922, it was overthrown, and after considerable wrangling between the Diet and the President, a new ministry was headed by M. Nowak During this period there had been no legislation of any constructive character. It was not until November, 1922, that elections were held for members of the national diet. In the following month both houses assembled for the election. The domestic uncertainty was heightened by the complexion of the national diet. The National parties of the right and the left had, in the election, succeeded in gaining an equal number of seats, 177 each, so that the balance of power was thrown to the minority parties, e.g. the Jewish, Ukrainian, German, and Russian, who controlled, in all, some 90 votes. These parties united with the left and forced the election of M Gabryel Narutowicz as the first president of the republic to succeed the provisional president, General Pilsudski. M. Narutowicz, a brief 48 hours after he assumed office, was assassinated (December 16) by a demented painter Demonstrations against the racial minorities, and the Jews in particular, indicated the popular excitement in the week preceding the assassination. On Dec. 20, 1923, M. Wojciechowski was selected to become the new president.

The racial problem, that of the Jew above all, was a serious one. Though Poland, in common with other Succession States, had signed a minorities treaty with the Allies, and in particular had guaranteed the Jews educational and religious liberties, the inability or refusal of the government, especially during 1918–20, to defend the Jews from attack aroused much apprehension. Charged with being German sympathizers and fraternizing with the Bolsheviks, but above all, held in contempt because of their want of Polish patriotism and their adherence to trade, the Jews were singled out for a course of vilification whose fury was quite incomprehensible to western Europeans and Americans. By a vigorous social, economic, and educational boycott all things Jewish were declared taboo. Jewish officials were dismissed, shops blacklisted, and professional men, i e teachers, doctors, and lawyers, dropped from the universities, army and administrative posts The Poles charged that the Jews consistently refused to conform their customs and life to those of the Poles about them; that the Zionist movement fostered a growing separatism. The Jews contended that political representation in proportion to their numbers was denied them, for although they formed about one-seventh of the population they had only 11 members in a national assembly of 390. Again, the perpetual discriminations in education, politics, and the professions prevented the Jew from rising above the petty mercantile class and taking up those other pursuits where he might come in contact with the general cultural ideas of the west The unhealthy state of mind of the Pole toward the "alien"—though the Jew had lived in Poland for almost 1000 years—fostered by a war-weariness engendered by the conditions of the preceding five years, led to serious excesses during 1918–20, which did not cease completely even by 1924. Sir Stuart Samuel, on a mission to the country, ascertained that at least 348 Jews had lost their lives as the result of rioting and the depredations of the soldiery. Other outrages were innumerable. Mr. Morgenthau, heading an American mission, reported similarly.

Internal affairs in the midst of such a tumultuous political and economic scene could hardly be expected to unwind themselves in a purposeful or orderly fashion The country was four-fifths agrarian, settled by an uneducated and unskilled peasantry working on lands of which 40 per cent were owned by 18,000 proprietors. To create a class of small landowners (for which, already, there was an ambitious programme formulated in 1921), to teach them the modern technique, and then to provide them with opportunities for reaching their markets by the development of means of communication, were the insistent problems which a depleted treasury and a continually falling currency could do nothing to alleviate. The cost of living steadily mounted to the accompaniment of the inevitable strikes and lockouts. In July, 1923, about 70,000 textile workers were out in Lodz alone; 90 per cent of the men in the engineering trades of Warsaw were idle at the same time; there were building strikes in Posen and Lublin and labor disturbances in almost all the industrial centres. Cabinets continued to follow each other in rapid succession. During 1923, M. Witos, of the Peasant party, headed a

government for a time but before the end of the year he had suffered defeat and surrendered his place to M. Grabski. The drift was steadily toward the Right and the large landowners daily gained power, as it became evident in 1924 that the real problem before Poland was fiscal reform and a balanced budget rather than the more controversial and possibly more evanescent hope of an agrarian policy.

In the field of foreign relations, Poland indicated a desire to come to an amicable understanding with most of her neighbors. On Mar. 3, 1921, a treaty was signed at Bucharest providing for an offensive-defensive Polish-Rumanian alliance and conversations for the further strengthening of this union were carried on in June, 1923. As a result of the settlement of the Upper Silesia question (q.v.) measures were taken in 1921 for the restoration of friendly relations with Germany. On Nov. 7, 1921, a treaty with Czecho-Slovakia was signed at Prague by which each nation guaranteed the other a benevolent neutrality in the case of attack as well as the recognition of each other's rights in Slovakia and Galicia. For the development of trade and transport with Russia commissions were appointed, while the export of agricultural implements to Russia and the Ukraine was encouraged. In accordance with this spirit, on Sept. 2, 1923, a note was delivered at Moscow declaring Poland's readiness to recognize the Soviet Federation upon the acceptance, by all of its constituent parts, of the terms of the Riga treaty.

Improvement in the relations with Danzig were marked after the agreement of 1921. On Mar. 17, 1922, Poland signed with Finland, Esthonia, and Latvia an agreement for the establishment of an enduring peace, while later in the year representatives of the Baltic States met with Russian commissioners for the purpose of effecting a general disarmament in the region. By the end of October the boundary between Poland and the Ukraine was definitively fixed by a mixed commission. As far as general international affairs were concerned, however, Polish policy was in the interest of France. The French attitude toward Poland had been persistently friendly, so that by ties of gratitude Poland was united to her western ally. During 1916–19, the French had encouraged the organization of the Polish Legion and had championed Polish aspirations at the Peace Conference, going so far as to favor Polish claims to all Upper Silesia and both banks of the lower Vistula, and Danzig. In 1920, too, France had come to the aid of Poland in the Russian war and in the next year both had signed a defensive alliance. A general political alliance, pledging economic and diplomatic coöperation, and promising concerted action in case of unprovoked attack, was signed by France and Poland on Feb. 19, 1921. The alliance was supplemented by a commercial convention (Feb. 6, 1922) providing for reciprocal tariff concessions, by a loan agreement (1923) extending to Poland a French advance of 400,000,000 francs to be expended mainly for strategic railways and other military purposes, and by other commercial and military agreements. Under the friendly but not disinterested protection of France, and in close concert with the Little Entente to the south and the Baltic nations to the north, Poland had become the cornerstone of the barrier between Bolshevist Russia and vengeful Central Europe. It was a position of strategic importance and prestige, but likewise of potential peril. See DANZIG; LITHUANIA; SILESIA, UPPER; VILNA; GALICIA, EAST; UKRAINE; WAR IN EUROPE, *Eastern Front*.

POLAR RESEARCH. This field of exploration was less affected by the War than were other phases of similar activity. The Canadian Arctic expedition, Shackleton's voyage into Weddell Sea, the Greenland expeditions of Rasmussen and Koch, MacMillan's elimination of Crocker Land, the repeated efforts of a trans-Arctic voyage by Amundsen's *Maud*, Vilkitski's northeastern passage from east to west, and Cope's work in southwestern Graham Land were the most important in results.

Antarctic. Bold in plan and adventurous in execution was Shackleton's attempt to cross the continent of Antarctica, from the *Endurance* in Weddell Sea to the *Aurora* in Ross Sea. In the *Endurance* he penetrated Weddell Sea to 77° south latitude, 35° west longitude, and skirting the shores of the southern continent, added 200 miles of new (Caird) coast. No landing could be made, and the ship, beset in ice and drifting with the main pack, was eventually crushed. After the sea-floe drifting north melted, the crew reached Elephant Island by boat, from which isolated and ice-beset land they were finally rescued after four dangerous voyages by Shackleton. In 1917, this indomitable explorer rescued seven men of the *Aurora* marooned in Ross Sea, where three had died in the meantime. On a subsequent Antarctic voyage in the *Quest*, Shackleton died and was buried at South Georgia, 1922; the *Quest* reached, however, new positions in the Antarctic Ocean. Cope's expedition, 1920–23, wintered on the most southwesterly point reached on Graham Land, and there made extended physical observations. Its members failed, however, to cross Graham Land and explore the west shores of Weddell Sea.

Arctic. Most important was the Canadian Arctic Expedition, 1913–18, which was divided into two parties, the northern under Stefansson, and the southern under R. M. Anderson. Stefansson's plans were disarranged by the besetment and loss of his ship, the *Karluk*, under Bartlett. Continuing his exploration under many difficulties, Stefansson discovered several islands, and traced the continental shelf of the Arctic Ocean from Melville Island, northeast to 80° 7′, north latitude, 98° 54′ west longitude. He made extensive sledge journeys on the main ice north of Alaska, reaching 76° 36′ north latitude, 132° west longitude; later, his assistant Storkeson attained by sledge on the same ice approximately 74° north latitude, 150° west longitude. The southern division under Anderson did less spectacular work, but made most important scientific researches. Besides surveying Bathurst Inlet, it made a thorough biological and physical study of the adjacent regions. Aided by experts, Anderson was in 1924 editing the official reports, which were expected to fill two volumes of narrative and 16 of scientific memoirs. These volumes form a valuable contribution to American science, as they treat the fauna, flora, ethnology and other subjects of special interest, pertaining to Arctic Canada. Up to Mar. 1, 1924, 47 of the 76 memoirs had appeared, and the others were under preparation.

Next in value were the explorations of MacMillan. In his first voyage, 1913–17, he made an unprecedented northing into the unknown regions northwest of Grant Land, and by crossing by sledge the alleged site of Crocker Land, reported as a discovery by Peary, proved its nonexistence. MacMillan further explored the northern edge of Parry archipelago, discovering six islands and mapping Finlay Island, his farthest west. His second voyage, 1921–22, was to Baffin Land, where he added new coast line, explored the unknown interior and made collections of its fauna and flora; he also found new tribes of Eskimos His latest voyage, 1923–24, covered research on the glaciers of the Kane Sea regions. Incidentally he erected at Cape Sabine the tablet of the National Geographic Society marking the final work of the Greely expedition, which represented the United States in its first scientific coöperation with other nations—11 countries in all.

Rasmussen's fifth expedition from Thule, near Cape York, was engaged from 1920 in a biological survey of the Eskimo tribes living on the Arctic edge of North America, or on adjacent islands. His researches up to 1924 had progressed satisfactorily among the primitive polar people between Baffin Bay and Arctic Alaska.

Amundsen's Arctic expeditions, 1919–24, were marked by repeated disasters. Originally he planned to drift in the *Maud* across the Arctic Ocean, starting from Bering Strait. Forced to winter, owing to ice conditions, at Aion Island, Siberia, 1919–20, he discovered new islands, made collections of fauna and flora, and studied the Tchukchis Two despatch bearers perished en route to Norway Renewed efforts the next year damaged the ship so that she returned for repairs. Meanwhile Amundsen arranged to supplement the drift by an airplane flight from Alaska to Spitzbergen. The *Maud* was started again in 1922, and in 1924 was slowly and safely drifting west Failing on account of defects in his airplane in 1923, Amundsen arranged to fly from Spitzbergen to Alaska, having Lieutenant Davidson, United States Navy, as pilot.

Koch's explorations of extreme northern Greenland, in which he introduced the use of a motor tractor in field work, and reached 80° north latitude, are treated under GREENLAND.

Russia pursued explorations along the Siberian coasts, with reference to establishing regular summer sea traffic but the definite results were unknown. Vilkitski made, in 1915, the northeast passage from east to west. It was learned that the long missing Russian north polar expeditions of Russanoff and of Brusiloff perished east of Franz Josef Land.

POLASEK, ALBIN (1879–). An American sculptor and teacher, born at Frenstat, Moravia, who studied art at the Pennsylvania Academy of Fine Arts and the American Academy in Rome and in 1910 was awarded the Prix de Rome. From 1916 he was head of the department of sculpture at the Art Institute of Chicago. His sculptures have been exhibited at Rome, Paris, New York, Philadelphia, and Chicago and are on permanent exhibition at the Pennsylvania Academy of Fine Arts, the Metropolitan Museum of New York City, the Art Institute of Chicago, and the Detroit Museum. They include the bust of Pierpont Morgan at the Metropolitan Museum, a portrait of F. D. Millet at the Pennsylvania Academy of Fine Arts, "The Sower" at the Chicago Art Institute, "Aspiration" at the Detroit Institute of Art, and "Bubble" at the Milwaukee Art Institute.

POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF. A learned society founded in 1889 for the study of political and social science Its bimonthly official publication, *The Annals*, is devoted to the discussion of political and economic subjects. Among the subjects treated in 1915 were industrial opportunity, America's interests as affected by the War in Europe, and public budgets. In 1916 the subjects treated included national industries and the Federal government, preparedness and America's international programme, and new possibilities in education. During 1917 *The Annals* contained articles on the purposes and ideals of the Mexican revolution, modern insurance problems, and stabilizing industrial employment. A supplement issued in May of that year dealt with the Mexican constitution and with the relation of the United States to international affairs. The issues for 1918 were devoted to the discussion of the mobilization of American resources for war and relief work, rehabilitation, and labor *The Annals* discussed in 1919, with other subjects, a reconstruction labor policy, international economics, international reconstruction, and the railroad problem. During 1920 the following subjects were discussed, the new American thrift; bonds and the bond market; labor, management, and production, and social and industrial conditions in the Germany of to-day In 1920 the leading subjects were present-day immigration; the international trade situation; the revival of American business; and child welfare. In 1922 space was given to the Federal Reserve system; Russia to-day; the ethics of the professions and of business; America and the rehabilitation of Europe; and western Europe and the United States. During 1923 the following volumes were issued: *Public Welfare in the United States; The Direct Primary; Social and Economic Conditions in the Dominion of Canada; America's Relations to the European Situation*, and *Prohibition and Its Enforcement.* At meetings of the Academy held during the year, subjects of national and international interest are discussed. At the meeting of 1923 the Academy was addressed by Sir Auckland Geddes. Two conferences were held in November and December, on the coal industries and the Monroe Doctrine, respectively. The president in 1923 was L. S. Rowe.

POLITICAL SCIENCE, ACADEMY OF. An organization founded in 1880, composed of men and women interested in political, economic, and social questions. It works in coöperation with Columbia University and publishes *The Political Science Quarterly*, with a Supplement twice a year. This Supplement contains a record of political events of the world in general and of the United States in particular. Semi-annual meetings are held, and many subjects of importance were discussed in the decade 1914–24. One of the most interesting and important, in 1919, considered the League of Nations Covenant. An

extensive volume on the Covenant was published, including addresses by many statesmen. Of these, about 5000 copies were distributed. The thirty-fifth annual convention of the Academy was held in New York City in 1919. At the annual meeting in 1920, the subject under discussion was American and foreign trade relations; about 1200 persons attended. The annual meeting of 1921 had for its subject construction experiments in industrial coöperation between employers and employees; a session was held jointly with the Industrial Relations Association of America. At the annual meeting in 1922 addresses were delivered on the money problem; these included "The Outlook for the Gold Standard," "The Agricultural Credit Problem," and "The Outlook for a Stable Monetary Problem Abroad." The annual and semi-annual meetings held in New York City in 1923 were of unusual importance. At the semi-annual meeting law and justice were discussed, and at the annual meeting the chief subject was American economic policies since the Armistice. Both meetings brought together a distinguished group of persons competent to present the different points of view of these subjects. Detailed reports of the meetings are published in the *Proceedings* of the Academy, and *The Political Science Quarterly* had many notable contributions in 1923.

The educational work of the Academy is carried on by meetings and publications. The publications comprise, besides *The Political Science Quarterly*, *The Annual Record of Political Events* and *The Proceedings* (semi-annual). Semi-annual meetings are held, and many subjects of importance have been discussed in the decade 1914–24; these have included: American mercantile marine, national conference on war economy, inflation and high prices, national expenditures and public economy, railroads and business prosperity, and wealth and taxation. The membership of the society is 5600. The officers are: president, Samuel McCune Lindsay; vice presidents, Albert Shaw and Paul M. Warburg; secretary, Parker T. Moon; Treasurer, George A. Plimpton; assistant treasurer and executive secretary, Ethel Warner.

POLITICS, INSTITUTE OF. A conference founded at Williams College through the generosity of Bernard M. Baruch, and continued with the financial coöperation of the General Education Board, for the purpose of advancing the study of politics and promoting a better understanding of international problems and relations. Although the Institute was proposed in 1913, the first session, as a result of various conditions, was postponed until the summer of 1921. Membership is limited to members of the faculties of colleges and universities and those to whom, by reason of special training and experience in the field of politics, invitations are extended. The sessions have been notable for their interest and importance. The first, held in July and August, 1921, was devoted to the study of international relations. Among those present and participating were Viscount James Bryce of England, Count Paul Teleki of Hungary, Tommaso Tittoni of Italy, and Prof. A. Viallate of France. In the second session, held in 1922, the subject was again international relations in their historical, political, legal, and economic phases. Special emphasis was placed on the problems of Central and Eastern Europe, the Far East, and Latin America. Among the eminent scholars and statesmen present were Lionel Curtis and Philip Henry Kerr of England, Manoel de Oliveira Lima of Peru, Raymond Recouly of France, and Dr. Joseph Redlich of Austria. At this session nearly 200 members were present. The third session was held from July 26 to Aug. 25, 1923. The question of international relations was again treated from many angles and by eminent representatives of the greater and lesser Powers. Addresses were delivered by Gen. Tasker H. Bliss, Sir Edward Grigg of London, Count Harry Kessler of Berlin, and others. Of special interest was the discussion of the international aspects of the Russian question. The session of 1924, beginning August 1, continued the discussion of economic, financial, political, and social conditions throughout the world. Among those who participated were Sir Valentine Chirol; Louis Aubert of Paris; Sir James Arthur Salter, finance chief of the League of Nations; R. H. Tawney, economic adviser of the British Labor party; Prof. Moritz J. Bonn of Berlin; Sir Paul Vinogradoff of Oxford; Yusuki Tsurumi of Tokyo; Rear-admiral Joseph Strauss, and John Spargo. The administrative officers of the Institute number Harry Augustus Garfield, chairman; Walter Wallace McLaren, executive secretary; and Willard Evans Hoyt, treasurer. The board of advisors includes distinguished representatives of many large universities.

POLK, FRANK LYON (1871–). An American public official (see VOL. XIX). He was appointed in the latter year councilor of the Department of State, where he served until 1919, when he became Under-Secretary of State In the absence of Secretary Lansing in 1918–19, he was Acting Secretary of State. He was appointed Commissioner of the United States to negotiate peace in 1919 and was head of the American delegation to the Peace Conference in Paris from July to December of that year.

POLLOCK, CHANNING (1880–) An American author and dramatist, born in Washington, D. C. He studied at Bethel Military Academy at Warrenton, Virginia, and at the Polytechnique in Prague. He had a varied newspaper career before devoting his attention to dramatic writing His later plays include: *A Perfect Lady* with Rennold Wolf, produced by Rose Stahl (1914); *Ziegfeld Follies of 1915*, with Rennold Wolf (1915); *The Grass Widow*, with Rennold Wolf (1917); *Roads of Destiny*, produced by A. H. Woods (1918); *The Crowded Hour*, with Edgar Selwyn, produced by Selwyn and Company (1918); *The Sign on the Door*, produced by A. H. Woods (1919), by Gladys Cooper at the Playhouse in London (1921), and at the Théâtre Renaissance in Paris, as well as in Vienna, Madrid, Amsterdam, etc.; *Ziegfeld Follies of 1921;* and *The Fool*, produced by Selwyn and Company (1922). During 1923 he lectured under the direction of the Pond Bureau. Besides his plays he wrote many stories and made dramatizations of numerous books.

POLLUTION OF STREAMS. See SEWERAGE AND SEWAGE TREATMENT.

POLO. The United States regained possession of the International Polo Cup, lost in 1914, by defeating Great Britain in two straight matches at Hurlingham, England, in 1921. The scores were 11 to 4 and 10 to 6. The victorious team comprised Louis E. Stoddard, Thomas Hitchcock, Jr., J. Watson Webb, and Devereux Milburn, while the losing four were Colonel

H. A. Tomkinson, Major F. W. Barrett, Major Lockett and Lord Wodehouse. In 1923, the United States was the scene of several international competitions, the most important being the matches between the army fours of the United States and Great Britain, in which the Americans were successful. The Meadow Brook Club of Long Island also defeated the British army team in the final match for the United States national open championship. Several American colleges took up polo after the War, Yale, Princeton and Harvard in particular developing creditable teams. In 1923, a Yale four captured the intercollegiate championship, both in indoor and outdoor play. In 1924, the national intercollegiate title was won by Princeton, in competition with the University of Arizona.

POLYTONALISM. See MUSIC.

POMERANIA. See POLAND.

POMERENE, ATLEE (1863–). An American legislator (see VOL. XIX). He was United States Senator for the term 1911 to 1917 and was reëlected in 1917 but defeated by Simeon D. Fess in 1922. In March, 1924, he was appointed by President Coolidge one of the two counsel to investigate the question of oil leases and the criminal responsibility of persons whose connections with it had been revealed by the proceedings of the Senate Committee investigating oil leases. See PETROLEUM.

POMONA COLLEGE. A coeducational institution at Claremont, Cal., founded in 1887 under Congregational auspices but free from ecclesiastical control. In the 10 years between 1914 and 1924, the physical equipment and material resources of the college were largely increased. About 50 acres were added to the campus; the spacious central quadrangle was opened and parked. Five large reinforced-concrete buildings were erected and two others reconstructed in such a way as to be practically new. The library grew from 22,000 to 41,000 volumes, and the teaching staff from 45 to 70. The student body was limited to 750 undergraduate members. In 1924, the endowment funds of the college amounted to about $1,500,000, and the total assets to about $3,700,000. President, James Arnold Blaisdell, D.D., LL.D.

PONSONBY, ARTHUR (1871–). A British public official, educated at Oxford. He was page to Queen Victoria from 1882 to 1887 and was connected with the diplomatic service at Constantinople and Copenhagen from 1894 to 1899. From 1906 to 1908 he was private secretary to Sir Henry Campbell-Bannerman. He was a member of Parliament from 1908 to 1918, and in 1924 he was appointed Under-Secretary of State for Foreign Affairs in the Labor cabinet of Ramsay Macdonald. He published *The Camel and the Needle's Eye* (1909); *The Decline of Aristocracy* (1912); *Democracy and Diplomacy* (1915); *Wars and Treaties, 1815–1914,* (1917); *Rebels and Reformers,* with Dorothea Ponsonby (1917); *Religion in Politics* (1921); and *English Diaries* (1923).

PONTOPPIDAN, HENRIK (1857–). An popular Danish novelist (see VOL. XIX). In 1917 the Nobel Prize for literature was divided between him and Karl Gjellerup. His recent publications include *Enslevs Dod* (1915); *Favsingholm* (1916); *Sandinghe Menighed* (1916); *Torben og Jytte* (1916); *Et Kaerlighedseventyr* (1918); *En Vinterrejse* (1920); and *Hojsang* (1921).

POOLE, ERNEST (1880–). An American author, born in Chicago. He graduated from Princeton in 1902 and for several years lived in the University Settlement in New York City. Here he accumulated material for articles and stories. His first published work was a play, *None So Blind.* This was followed by *The Man's Friends; The Harbor* (1915); *His Family* (1917); *His Second Wife* (1918); *Blind* (1920); *Beggar's Gold* (1921); and *Danger* (1924).

PORK. See LIVE STOCK.

PORTER, ARTHUR KINGSLEY (1883–). An American art historian. He graduated from Yale in 1904, and studied architecture at Columbia University. After several years of travel and study he became lecturer and then assistant professor at Yale University. In 1920 he was appointed professor in the history of art at Harvard University. Among his best-known books are *Mediæval Architecture* (1908); *The Construction of Gothic and Lombard Vaults* (1912); *Lombard Architecture* (1915–17) and *Romanesque Sculpture of the Pilgrimage Roads* (10 vols., 1923).

PORTER, HAROLD EVERETT ("HOLWORTHY HALL") (1887–). An American writer, born in Hyde Park, Mass. He graduated from Harvard in 1909 and for several years was engaged in the publishing business in Boston and New York. He served as captain of the Air Service in the United States Army in 1918 and later in the same year was detailed to the office of the Secretary of War. In collaboration, he wrote an official history of all types of aeroplanes and engines made in the United States. He was a member of many patriotic and other societies. His books include *Pepper* (1915); *Help Wanted* (1916); *The Six Best Cellars,* with H. M. Kahler (1919); *Egan* (1920). He also wrote several books on aviation and was a frequent contributor of short stories to leading magazines.

PORTLAND. A city and port of entry of Oregon. The population increased from 213,251 in 1910 to 258,288 in 1920 and to 273,621 by estimate of the Bureau of the Census for 1923. A major street plan and port development scheme were partly carried out by the city between 1914 and 1924. In the new and developing portions of the city, eight principal streets were planned 100 feet wide, and water-front hauling streets 120 feet wide. A system of boulevards and parkways was laid out and the minor residence streets limited to narrow pavements. Nine grade crossings were eliminated by depressing the railroad tracks over the entire distance between the crossings, and building viaducts to carry the streets over. The cost of this, $1,055,000, was met by the railroad and the city together. A bond issue was authorized in 1922 for two concrete bridges over the Willamette River, allotting $3,000,000 to a new bridge on the site of the old Burnside bridge and $1,600,000 for another bridge about 1½ miles further upstream at Ross Island. The first was about 3000 feet long with a bascule centre span; Ross bridge, which had no draw, but cleared low water by 132 feet, was to be 4000 feet long and 54 feet wide. A memorial civic centre was planned by the city. In 1917, $3,000,000 in bonds were issued by popular vote for improving the port facilities, constructing a grain elevator of 1,000,000 bushels capacity, and a dock and warehouse 1000 feet long by 175

feet wide. Further plans for port improvement, adopted in 1923, included the purchase by the city of about a mile of water-front property between four downtown bridges, building a sea wall and filling the land behind it, moving the interurban railroad tracks from streets in the city to the filled land and elevating the approaches to the bridges so they would span the tracks, and the building of interurban terminals, public markets, and an interceptive sewer. A 35 foot channel was dredged from Portland to the sea. A new post office building was completed at a cost of $1,000,000 by the Federal government; a new sewer in the Lents district was completed by the city in 1924 at a cost of $780,000, and a water conduit which was to have a capacity of 65,000,000 gallons was under construction. Building permits rose from 5959 valued at $8,334,075 in 1914 to 14,518 valued at $25,247,135 in 1923, bank clearings increased during the same period from $578,884,000 to $1,871,946,000, exports from $13,806,500 to $44,012,560, and imports from $3,890,222 to $9,503,863.

PORTLAND CEMENT. See CEMENT.

PORTO RICO. An island possession of the United States in the West Indies. The population of Porto Rico increased from 1,118,012 in 1910 to 1,299,809 in 1920. The distribution in 1920, according to color, was as follows: white, 948,709; black, 49,246; mulatto, 301,816; all others, 38. The chief cities, with their population in 1920, are San Juan, 71,443; Ponce, 41,912, and Mayaguez, 19,124.

Government. The act of 1917 separated the legislative and executive functions and created an appointive judiciary system and an elective Senate. The chief executive is a governor, appointed by the President. The Legislature consists of two Houses, the Senate composed of 19 members and the House of Representatives composed of 39 members. A resident commissioner represents Porto Rico in Congress. Six heads of departments form a council to the governor.

The Judiciary includes the supreme court, eight district courts appointed by the governor, and minor courts also appointed by the governor.

Agriculture. The number of farms in Porto Rico decreased from 58,371 in 1910 to 41,078 in 1920; the improved land in farms decreased from 1,570,304 acres to 1,303,547. The value of farm property, however, increased from $102,378,874 in 1910 to $179,392,511 in 1920, and the average value per farm increased from $1754 to $4367. The production of sugar cane increased from 3,180,750 tons in 1909 to 3,961,984 in 1919; the value of sugar exports increased from $23,545,922 in 1910 to $46,207,000 in 1923. The production of tropical fruits became an important industry in the island; the total value of shipments of fruit and fruit products in 1923 amounted to $5,154,290. The acreage in coffee decreased from 186,875 in 1909 to 193,561 in 1919, and the value of the production increased from $5,292,179 to $11,707,391. In 1923, 16,000,000 pounds were exported, valued at $3,000,000 The owners of farms decreased from 46,779 in 1912 to 36,407 in 1920; the number of farm managers increased from 1170 in 1912 to 1213; the tenant farmers decreased from 10,422 in 1910 to 3458 in 1920. The white farmers in 1910 numbered 44,251, compared with 35,194 in 1920; the colored farmers decreased from 13,850 to 5884. The extension work in the island is carried on by the Department of Agriculture and Labor. Seed selection received special attention throughout the decade, and experiments resulted in a considerable development of cotton-growing. A vigorous campaign was carried on for the elimination of insect pests. The extension of the Federal Loan Act in 1922 was of great value to farmers in Porto Rico. Agricultural conditions after 1919 were generally favorable, although there were decreases in certain of the crops. The production of sugar in 1923 was 379,000 tons and the value of the sugar export was $46,207,000. The production of coffee declined from 1914, when 50,000,000 pounds were exported; in 1923, only 16,000,000 pounds valued at $3,000,000 were exported. The tobacco industry had a remarkable increase. In 1913, only 473 persons were employed in its production; in 1919, there were 7272, and in 1922, 11,962. In 1923, 14,904,723 pounds of leaf tobacco and 4,668,812 pounds of scrap tobacco were sold from Porto Rico. The total value was approximately $10,000,000.

Manufactures. The chief industry of Porto Rico being agriculture, its manufacturing is, to a large extent, undeveloped. The number of establishments decreased from 939 in 1909 to 619 in 1919. The persons engaged in manufacture remained practically stationary, numbering 18,122 in 1909 and 18,454 in 1919. The chief industries are the manufacture of sugar and molasses, tobacco manufacturers and the cleaning and polishing of coffee. In 1919, there were manufactured 686,037,703 pounds of raw sugar; 122,668,473 pounds of clarified sugar; 10,342,600 pounds of brown sugar; 18,783,172 gallons of molasses, as compared with 566 445,203 pounds of raw sugar and 17,374,097 gallons of molasses in 1909. The total value of all kinds of sugar in 1919 was $55,607,202; of molasses, $637,799; and of all other products, $166,931, or an aggregate value of $66,411,932. In 1909, the raw sugar manufactured was valued at $20,164,887 and molasses at $397,008. In 1919, a total of 171,184,749 cigars were manufactured, compared with 217,792,000 in 1909. The total value of tobacco products in 1919 was $8,134,534 compared with $6,060,393 in 1909. The total quantity of cleaned and polished coffee in 1919 was 50,252 820 pounds, as compared with 44,350,435 pounds in 1909. The total value of products increased from $36,749,742 in 1909 to $85,506,834 in 1919. The capital invested increased from $25,554,385 in 1909 to $83,151,310 in 1919. The value added by manufacture increased from $15,270,450 in 1909 to $25,679,560 in 1919. The manufacture of breads and bakery products, men's clothing, food preparations, and printing and publishing also are of considerable importance. The manufactures are limited almost entirely to the larger towns, San Juan, Ponce, Mayaguez, Caguas, Bayamon and Arecibo.

Mineral Production. Stone forms practically the only mineral production of Porto Rico. The total value of the product of all the quarries in 1919 was $158,157, compared with $5459 in 1909, or an increase of nearly 3000 per cent. There were 14 quarries under operation in 1909, and 13 quarries in 1919, employing about 200 wage earners.

Education. Since the island became a territory of the United States, the government of Porto Rico has used the utmost efforts toward the education of the people, especially the children. These efforts have been well received by the people and the results have been

extremely favorable. There is an unusually large school population. Out of a total of 1,297,772 in 1920, 452,446 were between the ages of 5 and 18. The percentage of school population, therefore, is 35, which is probably the largest percentage found anywhere in the United States, or perhaps in the world. The average daily attendance in all the public schools increased from 155,830 in 1914 to 184,991 in 1920, and to 225,600 in 1923. In the latter year 134,405 pupils were enrolled in rural schools and 91,195 in urban schools. In addition there were 5632 pupils in private schools. The total number in public and private schools was 231,232. At the time of the American occupation, 80 per cent of the population were found to be illiterate. This proportion was reduced in 1910 to 66 per cent and in 1920 to 55 per cent. In 1899, only 8 per cent of the persons 5 to 17 years of age were attending school; in 1920, over 45 per cent were reported in school. Special attention was given during the decade 1913–23 to practical instruction in agriculture. During the first decade of American occupancy, 950 rural schools were established; there were 1700 in 1920 and 2000 at the close of 1923. Industrial education also received adequate attention. In 1914, manual training for boys and household economics for girls were made obligatory for students in grades 6 to 10 in the public schools, in towns where the attendance warranted the installation of the necessary apparatus. The importance of placing education within the reach of a large number of illiterate adults was early recognized and for their benefit night schools were established. In 1914, an average of 825 such schools were maintained, and this number had greatly increased in 1923. During the decade, instruction in hygiene and health preservation was established and strengthened. Dental clinics were established in many schools and general health clinics were started and medical inspection in rural schools was begun.

Facilities for higher education were provided by the University of Porto Rico and by the College of Agriculture and Mechanic Arts at Mayaguez. The university consists of a College of Liberal Arts, College of Law, College of Pharmacy, Normal School, and High School division The number of students enrolled in 1922-23 was 1477; the number of professors and teachers was 77.

Trade and Commerce. The remarkable commercial expansion of Porto Rico in the decade 1913–23 is shown by a comparison of trade figures. In 1913–14, the combined value of imports and exports was $79,509,549; in 1923, it was $154,237,655. The merchandise shipped from Porto Rico to the United States in 1914 was valued at $34,423,180; in 1923, it was $77,007,257. The imports from the United States in 1914 were valued at $32,568,368, and in 1923, $64,743,462. The chief exports are sugar, cigars and cigarettes, tobacco leaf and coffee. The exports of sugar increased from 320,633 tons valued at $20,240,335 in 1914 to 355,423 tons valued at $46,207,276 in 1923. There were exported, in 1914, 150,363,991 cigars and 184,625,596 in 1923. The tobacco leaf and scrap exported in 1914 was valued at $3,206,610, and in 1923 at $9,647,063. The coffee exports in 1914 were valued at $8,193,544 and in 1923 at $3,188,002, a considerable decrease. The exports of fruit, including oranges, pineapples, coconuts, grapefruit, were valued, in 1914, at $3,400,903, and in 1923 at $5,154,290. During the American occupation there was a rapid growth of trade with the United States. During the 23 years covered by this occupation, the value of imports from all foreign countries increased only from 3 to 7 million dollars, while the value of purchases from the United States increased from 6 to 64 million dollars The value of exports from Porto Rico to all foreign countries increased from 3 to 5 million dollars, while the value of Porto Rican shipments to the United States increased from 3 to 77 million dollars. More than 90 per cent of all the external commerce of the island is with the United States.

Finance. The beginning of the decade 1913–23 was marked by a severe financial crisis caused by the fact that laws passed by the Legislature to provide sums for public improvements failed to attain the results expected. The result was a large deficit. Prompt measures were taken to avert disaster and the legislative assembly in 1914 promptly passed laws to meet the situation. All forms of expenditure upon public improvements were suspended, and provision was made for an issue of $1,000,000 worth of bonds to reimburse the treasury for money already expended, and to provide for further work. An Economy Commission was also appointed to readjust the finances. The total receipts of the treasury for the year 1913–14 was $10,108,708 and the expenditures amounted to $7,278,328. The receipts for the fiscal year 1922–23 were $10,118,891 and the expenditures $10,801,640. The bonded indebtedness in 1913–14 was $5,925,000. This had increased, in 1920, to $10,264,000, and in 1923 to $12,694,000.

Transportation. An elaborate system of excellent roads has been perfected and as a result of the work during the decade 1913–23, there were over 1000 miles of improved highways at the end of that period. A large part of the transportation of commodities is done by motor trucks over these highways. There were, in the island, 339 miles of railroad. Important improvements were made during the decade in San Juan harbor where a reinforced concrete bulkhead was built along the entire waterfront. Streets leading to the harbor were paved and made suitable for the heavy transportation. The new pier at Ponce was completed and placed in commission in 1914. In 1920, provision was made for the construction of a large new pier in San Juan harbor and the expansion of the bulkhead. The harbor was also dredged, in order to provide navigation by the largest vessels.

Health and Sanitation. The sanitation service in the island was organized in 1913 under a law passed in 1912, and during the decade 1913–23 vigorous and successful work was carried on by this service. Successful efforts were also made during the decade for the building, in various cities, and towns, of modern aqueducts for the supply of pure water, for sewer systems, for sanitary slaughterhouses and meat markets, and for clean dairies. Great improvement was made also in the proper construction and plumbing of dwelling-houses. The work of eradicating the hookworm, which was so prevalent in the island that over 90 per cent of the laboring-people were infected, was undertaken. The Insular Health Service and the Rockefeller Foundation coöperated for the eradication of

the disease, with remarkable success. By 1923, approximately one-sixth of the rural population of the island had received treatment. Tuberculosis is the chief menace to the health of the people. The percentage in proportion to general mortality increased from 7.28 in 1914 to 9.45 in 1923. Every effort was being made to eliminate conditions favorable to this disease. Malaria ranks third in mortality records. In 1923, arrangements were made by which the Rockefeller Foundation united with the insular authorities in an intensive campaign for mosquito and malaria control. The death rate increased from 18.6 per thousand in 1913 to 21.11 per thousand in 1923. It may be pointed out, however, that the rate for 1923 was the lowest ever recorded on the island. For 1912, it was 24.02. A leper colony was maintained on the Island of Cabras at the entrance of San Juan harbor. Arrangements were made to remove this colony to the mainland and work was begun in 1923 for the improvement of the new location. In 1910, a service was instituted in the island for the study and prevention of tropical and transmissible diseases, and in 1920 the Legislature created an institute of tropical medicine and hygiene. This institution performed services of great value in investigation and research and hundreds of patients were treated annually for various diseases.

History. The most important event in the political history of Porto Rico in the decade 1914–24 was the passage by Congress, in 1917, of a new Organic Act, providing for the government of the Islands. The beginning of the decade was one of financial difficulty and economic readjustment. Business conditions in Porto Rico were greatly affected by the tariff law passed in 1913. More important than this, however, was the serious decline in the sugar industry in 1914, owing to local and general conditions. In 1915, because of a lack of cooperation between the two houses of the Legislature, comparatively little important legislation was enacted. The Legislature of 1916 passed several important measures relating to revenue and taxation. On Mar. 2, 1917, President Wilson approved the new Organic Act for Porto Rico. This was received everywhere with great satisfaction The people were especially pleased with the granting of American citizenship. By terms of this measure the legislative power is vested in a Legislature consisting of two houses. The Senate consists of 19 members elected for four years and the House of Representatives consists of 39 members elected for four years. Sessions are held biennially. The designation of the qualifications for suffrage is left to the Legislature. Both branches of this body are elected by the voters but its action must be approved by Congress and by the Governor, who is appointed by the President. A "Resident commissioner" to represent the islands in Congress is elected by the people. With the entrance of the United States into the War, many new problems arose in Porto Rico. Among these was the peril of interrupted communication with the continents and the laws of ships engaged in trade. This tended to increase the price of foodstuffs, which were already abnormally high. A Food Commission with wide powers was appointed. After the passage of the compulsory military service law, the people of Porto Rico showed a strong feeling of patriotism and loyalty, and readily joined in all the activities, including subscription to the Liberty Loan issues. The Legislature in 1917 passed a joint resolution providing for the holding of general elections and providing for nomination of candidates. After Mar. 2, 1918, the prohibition of all alcoholic beverages went into effect. A destructive earthquake occurred in October, 1918. The heaviest losses were at Mayaguez and Aguidilla. About 150 lives were lost and the damage to government works and public buildings was over $1,000,000. A great sea wave followed the earthquake and increased the loss, especially at Aguidilla. The Legislature in 1918–19 passed a new election law changing the methods and machinery of election, a new municipal law, providing for a larger degree of self-government, a grand jury law, several labor laws, and a measure establishing a minimum wage. The year 1920 was one of unusual prosperity and progress, although there were several strikes during the year in the sugar cane fields and among the dock workers. In spite of these disturbances the general prosperity of the island increased greatly. A special session of the Legislature, an Apr. 26, 1920, passed an important amendment to the tax laws. It also amended the excise laws, the election law, the municipal law, and the workmen's compensation law. An act was passed authorizing coöperative societies of production and consumption. E. Mont Reily was appointed governor by President Harding in July, 1921, succeeding A. M. Yager, who had occupied that post since 1913. Following the inauguration of Governor Reily, the aggressive attitude adopted by him toward the political leaders of the island at once created a situation of great difficulty. The Unionist party was accused by supporters of Governor Reily of aiming at secession from the United States. This party was the most powerful of the political bodies of the island and was headed by Antonio R. Barcelo, president of the Senate. The leaders of this party were charged by Governor Reily with sedition and he administered a severe rebuke to Señor Barcelo, who resigned from the leadership but was obliged to resume it on account of the insistence of his supporters. The Governor dismissed several high officials and replaced them with Republican successors. In this he was severely criticized By the end of the year a majority of both the Lower and Upper Houses petitioned President Harding for the removal of Governor Reily. The President took no action, but Governor Reily resigned on Apr. 1, 1923 He was succeeded by Horace M. Towner, under whose administration political difficulties subsided. The Legislature of 1923 amended the excise tax law, amended a banking law, created a tax and revenue commission, created a coal commission, and created also a rural improvements commission.

PORTUGAL. A republic of western Europe with an area, including the Azores and Madeira islands, of 35,490 square miles, and a population in 1920 of 6,041,000. The 1911 population had been 5,957,985. The chief towns, with their populations in 1920, are: Lisbon, the capital, 489,667; Oporto, 203,199; Setubal, 37,074; Braga, 21,970. Emigration continued to keep the population almost stationary; 31,138 natives left the country in 1919 for Brazil and the United States, largely. Between 1912 and 1922 the total emigration was estimated at 700,000. In spite of frequent governmental decrees, education made no perceptible advances. The number of primary

and secondary schools in 1920 showed little increase over those recorded in 1911. Seventy-five per cent of the population was believed to be illiterate.

Industry and Trade. After 1902, when the last census of agriculture was reported, the state of agriculture declined, being handicapped by lack of transport facilities and of efficient use of fertilizers. In the earlier year, 34.9 per cent of the total area was devoted to tillage; of late (1921) this had dropped to 33.6 per cent. Waste land increased from 43.1 per cent to 49.1 per cent of the total. The yield of wine, one of the most important activities, dropped from 6,869,400 hectoliters in 1908 to 4,392,780 hectoliters in 1919. The cereal crops cultivated, i.e. rye, wheat, corn, were for home consumption and the fattening of stock. Articles that entered into the trade of the country, indicating a certain amount of application, were cork, olive oil, raw wool, hides, sardines, and wine. The trade fell off during the War, as may be seen from the following: exports and imports for 1913 (escudo at par or 53¼ pence per escudo), £17,986,222 and £8,152,222; exports and imports for 1918 (escudo at 30½ pence) £11,561,990 and £9,774,720. The continued decline of the escudo brought the trade record still lower in the years succeeding. Thus, while exports to the United Kingdom were £9,747,000 in 1918, they fell to £4,589,000 in 1922. Tonnage figures reveal the same state of affairs In 1913, 10,638 vessels of 24,368,120 tons entered Portuguese ports; in 1917, 5860 vessels of 4,906,599 tons entered; in 1920 (the best post-armistice year), 9909 vessels of 16,101,695 tons entered. During and after the War the general economic conditions reflected the prevailing social and political unrest. Raw materials could be obtained only with difficulty—the shortage of cotton, gasoline, tin plate, and coal being particularly severe—and factories and mines had to suspend operations. From 1914 to 1918, the average price increase of foodstuffs was 263 per cent. The failure of wages to rise accordingly (increases were only for 50 to 100 per cent) resulted in severe strikes in the railroads, telephone companies, shipping, metallurgical industries, etc. However, the strikes were successful in raising wages 20 to 30 times the pre-war rates, while the cost of living advanced 20 times. Attempts in 1918 and in 1920 to check the depreciating exchange by government enactment were unavailing. In 1918, a law was passed requiring half the payments of import duties in gold; in 1920, certain imports were banned altogether because of the rapid flow of gold out of the country. Yet so rapid was the disappearance of the gold reserve that in 1922 the National Bank of Portugal had only 8,577,180 escudos in gold, to 734,388,164 escudo paper notes in circulation. By December, 1923, paper in circulation totaled 1,395,700,000. Therefore, whereas the escudo had been worth 53½ pence before the War ($1.08), by 1921 it had declined to 7 pence ($0.10) and by the end of 1923 to about 3½ cents. Only the activities of the colonies succeeded in keeping the home industries active, for the raw materials imported made up in part for the decline of the foreign trade.

Communications. In 1913, there were 1854 miles of railway in operation; in 1923, 2046 miles. The steady depreciation of equipment and the falling off of traffic piled up the obligations of the systems. In 1923, 12,000,000 gold escudos were needed for repairs and replacements. Action was taken in 1921 toward the better upkeep of the highways.

Finance. The budget for 1914–15 called for revenues of 79,649,140 escudos and expenditures (ordinary and extraordinary) of 83,390,965 escudos. The 1922-23 budget included revenue estimates of 276,137,853 escudos and expenditures of 561,326,152. (It should be borne in mind that the escudo had by that time declined to one-twenty-fifth of its nominal value.) All attempts to check the mounting deficits failed. From 1914 to 1924, the average annual deficit was 197,000,000 escudos. For 1921-22, the deficit was 370,820,000, and for 1922-23, an estimated deficit of 295,190,000. The decision to resort to loans for the meeting of war expenditures increased the national debt enormously. In 1913, the external debt amounted to 175,396,150 escudos; on Dec. 31, 1923, the external floating debt amounted to 2,686,403,269 paper escudos (at current exchange rates); on July 31, consolidated external debt was 1,764,000,000 paper escudos. By 1923 the internal debt had mounted to 2,049,000,000 escudos (as compared with 713,689,000 in 1913). (In connection with financial figures, it should be noted that Portuguese official data were conflicting: making it impossible to render consistent statements on the subject.) In 1923, to check the speculation and stabilize the currency, the government offered a loan of £4,000,000 gold bonds to be paid for in escudos at the rate of 5 pence to the pound In February, 1924, in spite of all promises to the contrary, the government coolly repudiated the interest payment in gold on this loan.

Administrative Affairs. During the period, decrees affecting working conditions, accidents, women and child labor (1914–15) and the eight-hour day for government employees (1919), were promulgated. In 1918, a ministry of agriculture was set up with extensive powers for the encouragement of production by the renting of cattle and machinery; and the extension of credits. By enactment in 1914 and later in 1919, extensive autonomy was granted to the colonies. State aid was guaranteed settlers; the status of native laborers was advanced; expert agricultural and geological investigations were promised. These measures were occasioned by the fact that the Union of South Africa sought to acquire Portuguese East Africa, and Belgium, northern Angola. The home government realized that only the colonies might hasten the resurrection of Portugal; the loss of them would mean the definite submergence, economically, of the country.

History. Portugal's recent history was a continuous change of administrations accompanied by crises of smaller or greater importance. The great gulf existing between political leaders and the people at large was perceptible as ministries rose or fell amid a general indifference. The increasing illiteracy, the steady emigration of the peasantry to the New World, and the lack of capital for new enterprises, all accounted for the general stagnation. The violent break between church and state, which had been one of the first works of the revolution, was considerably tempered by conversations resumed by President Paes with the Vatican in 1918. In 1919, a papal nuncio was appointed to Portugal, and in 1920 the Pope expressed himself as satisfied with the improved conditions.

Portugal's traditional friendliness with Eng-

land, her dependence on the latter for heavy importations of wheat and coal, and the fear entertained for the safety of the African colonies, led Portugal to affirm her obligations under the British treaty, in November, 1914. Troops were immediately despatched to Africa and contingents were sent throughout the War, 40,000 men seeing service in this area. In 1916, Portuguese troops entered the Kionga triangle and thus restored to their country a territory that had been seized by Germany in 1894. In 1916 German ships lying in Portuguese waters were seized (240,000 tons); Germany retaliated by formally declaring war on Mar. 9, 1916, and opening a severe submarine attack on shipping and ports. In 1917, shipping losses were particularly heavy. At first, the country's entry into the War served to unite all factions. A coalition ministry was erected and the royalists for a time stayed their intrigues to offer their patriotic services. Portuguese contingents saw action on the Western front in 1918, in all, 60,000 men taking part. At the Peace Congress, Portugal was represented, first by Dr. Egas Moniz, and later by Dr. Afonso Costa. Subsequent meetings of the Supreme Council restored the Kionga triangle to Mozambique and allotted Portugal 0.75 per cent of the German indemnity.

Portugal's participation in the War did not check internal disorders. In 1915, a mutiny of sailors resulted in the bombardment of Lisbon and the killing of 100 persons; Sr. Pimenta de Castro, the prime minister, was transported to the Azores; his successor was shot at, and resigned soon after; and this was followed immediately by the resignation of President Arriaga. These events were a prelude to the larger events of 1917. In December of that year, a revolution broke out in Lisbon and the fleet was fired upon. The purposes of the revolutionaries were for a more active participation in the War, and the resignation of the government which had antagonized the conservative classes. The result was the deportation of President Machado, the arrest of the premier, Dr. Afonso Costa, and the selection as provisional president of Maj. Sidonio Paes, leader of the revolt. On Apr. 28, 1918, Sr. Paes was elected by direct suffrage as president, though the republican parties refused to participate. By the support of the Catholics, whom he immediately propitiated, and the conservative elements, his powers at once became dictatorial. Parliamentary ministers were transformed into secretaries responsible to the president; all efforts were bent on the prosecution of the War, to the great approval of the Allies. But Sr. Paes, who might have restored Portugal to something like stability, was assassinated on Dec. 14, 1918, and the country was once more in a state of turbulence. In 1919, the uncertainty was capitalized by the monarchists who proclaimed a monarchy at Oporto under the regency of Captain Conceiro. The general rising of the marines and the radical elements made the royalist revolution short-lived so that after a few weeks of desultory fighting, Captain Conceiro was captured and the civil war ended. Ministry followed ministry in rapid succession. Adm. Canto e Castro, having followed Paes in the presidency, resigned in 1919; he was followed by Dr. José de Almeida. The railroad strike of 1920 embarrassed the government; the failure to cope with the pressing internal problems of taxation, the currency, public works, served to render the existing machinery useless. The counsel of former King Manuel to his followers, in 1920, to give up violence and resort to constitutional tactics only, had little influence on affairs. During 1921, Sr. Granjo, the prime minister, was killed as the result of another outbreak in Lisbon; and bomb outrages were frequent in 1921 and 1922. After eight ministries had held office for brief terms in 1922, a cabinet created by Sr. de Silva seemed to bear the stamp of permanency, for it lasted into 1923. But the election of the new president, Sr. Teixeira Gomez, in August, 1923, brought about a new ministry. The year 1923 saw a continuance of disturbances accompanied by bomb throwing, strikes, and rioting. Lisbon was once again fired on in December. A long drawn-out marine strike threatened to wipe the Portuguese flag from the high seas. As yet, there was in sight no surcease from the intestine strife which had prevailed, with distressing results, for more than two decades.

PORTUGUESE EAST AFRICA, or MOZAMBIQUE. A Portuguese colony on the east coast of Africa with an area of 427,713 square miles and an estimated population of 3,437,844 natives, 10,500 whites, 1100 Asiatics. In 1919, the Supreme Council awarded the province an area of 400 square miles, formerly part of German East Africa, known as the Kionga triangle. Capital, Lourenço Marques, had an estimated population of 20,000. Sugar, coconut palm, and sisal areas increased, particularly in the districts controlled by the Mozambique Company. Other products were rubber, ivory, wax, and various ores. The trade figures for 1913 and 1921 were, in escudos: imports, 12,678,000 and 39,812,313; exports, 5,346,000 and 26,117,513; reëxports, 8,935,000 and 42,055,947; transit, 34,044,000 and 135,393,526. Most of the transit trade was handled through the port of Lourenço Marques at which, in 1920, 618 vessels of 2,321,698 tons entered; of this tonnage, two-thirds was British. Costs of administration mounted during the period. In 1913–14, the budget balanced at 5,878,598 escudos; in 1922–23, at 16,300,835 escudos. (One escudo = $1.08 at par.) After 1913, the railway building was active due to the interest manifested by the British South African provinces because of their desire to utilize the Territory's ports. Some 160 miles along the route from Delagoa Bay to Inhambane were completed; the building of a line 170 miles long from Beira to the Zambezi was begun in 1920, and projects were under way for the development of the areas north and south of the Mozambique Company's holdings. The position of Portuguese East Africa became increasingly important after 1909 because the province served as the nearest outlet for the British South African products to the sea. Delagoa Bay in particular, being 100 miles nearer to Johannesburg than Durban, was favored, and the commercial facilities and social amenities of its city, Lourenço Marques, showed continual improvement. Coal-bunkering plants were erected as well as large wharves and docks. Through Delagoa Bay went much of the Transvaal's coal, copper, tin, asbestos, and maize. Shipping after 1914 was mainly in British and Portuguese hands. This economic relationship between the province and the British colonies accounted for the attention which Portuguese East Africa received from the home administration after 1910. The natives were subjugated and turbulent areas pacified, and Portuguese capital was invited to aid in the

province's exploitation. The result of the War put an end to the attempts of the German-controlled Nyasa Company to dominate the province. Great Britain, of course, then became the paramount factor.

POTATOES. The average annual production of potatoes in the United States, 1914–24, was 3,862,000 bushels. The largest acreage toward the close of the period, 4,384,000 acres, was harvested in 1917; and the largest yield, 451,185,000 bushels, was secured in 1922. Beginning with 1914, potato culture increased in the northern Mississippi Valley, especially in Minnesota and North Dakota; and several localities, particularly in western Nebraska, Idaho, and Colorado, became prominent in the production of the crop Latterly the production of early potatoes, which come upon the market about May 1, became an important enterprise in Florida. The growing of certified potatoes for seed also became an established industry, with an increasing annual production of such potatoes in a number of States and in Canada. Certified potatoes are grown by reliable parties in accordance with the rules and regulations for eligibility to certification in the various States. These requirements are, generally, freedom from varietal mixtures; conformity of tubers to the accepted type for the variety in shape, color, size, and characteristic markings; a fair degree of uniformity in size, and freedom from disease. The crop, as a rule, is inspected two or three times during growth. During the War, limited supplies and unsettled conditions led to the subjection of the international trade in potatoes to governmental regulation in many countries. In the United States all large potato dealers were under license to the Food Administration, and standard grades recommended by the Food Administration and the Department of Agriculture were prescribed from January 31 to Dec. 10, 1918. Use of the grades proved so satisfactory that it was continued voluntarily, and many States later passed laws establishing these or very similar grades as their official standards. As revised and effective July 1, 1922, the United States grades for potatoes comprise U. S No 1; Fancy; U. S. No. 1; U. S. No 1 Small; and U. S. No 2. These ratings are based on size, shape, uniformity, and the general absence of defective stock. In 1921 and 1922 low prices and high freight rates reduced shipments from many sections producing potatoes commercially, and these conditions added materially to the financial distress which befell farmers in the years following the War.

In the list of diseases attacking the potato plant hopperburn (or tipburn), spindling sprout, and mosaic caused trouble. Hopperburn, caused by the potato leaf hopper, is a blighting and drying up of the leaves during hot and dry seasons; spindling sprout is the production of weak and threadlike sprouts; and mosaic, long known in Europe, is a disease showing mottling of the leaflets with patches of light green. The Colorado potato beetle invaded Europe and became established in France and Belgium. This was suggested as possibly the result of the unusual war-time intercourse It was causing dismay in northern Europe, where potatoes form a large part of the average diet. Consult William Stuart, *The Potato. Its Culture, Uses, History, and Classification* (Philadelphia and London, 1923).

POTT'S DISEASE. See ALBEE, FRED HOUDLETT.

POUND, ROSCOE (1870–) An American lawyer and educator (see VOL. XIX). From 1913 he was Carter Professor of Jurisprudence and from 1916 dean of the Law School at Harvard University. He wrote *Lectures on the Philosophy of Free Masonry* (1915), and *The Spirit of the Common Law* (1921).

POWDER, SMOKELESS. See EXPLOSIVES.

POWELL, E. ALEXANDER (1879–1925). An American author and war correspondent, born at Syracuse, N. Y., and educated in Syracuse University and Oberlin College. During the War he was correspondent for daily papers in New York and London and for *Scribner's Magazine,* and served with distinction in the army. His books include: *The Last Frontier* (1912); *Gentlemen Rovers* (1913); *Fighting in Flanders* (1914); *Italy at War* (1917); *The Army Behind the Army* (1919); *The New Frontier of Freedom* (1920); and *Asia at the Crossroads* (1922).

POWELL, JOHN (1882–). An American pianist and composer, born at Richmond, Va., and educated in music in Vienna, where he studied from 1902 to 1907 with Leschetizky (piano) and Navrátil (composition). After his pianistic début in Berlin (1908) he played in Vienna, London, and Paris. In 1912 he returned to his native country and made his American début in New York He later made frequent appearances, chiefly as interpreter of his own works. While his compositions have titles suggesting classical forms, the contents and treatment are very free, so that the works give the impression of being improvised rather than logically developed. For his thematic material he made extensive use of negro melodies harmonized in the most modern fashion. His works comprise a concerto for piano and orchestra; a violin concerto; an overture, *In Old Virginia; Rapsodie Nègre* for piano and orchestra, and a string quartet. His piano works, almost exclusively in cyclical forms, include four sonatas (*Virginiancsque, Psychologique, Noble, Teutonica*) and two suites (*In the South* and *At the Fair*).

POWER, FREDERICK BELDING (1853–1927). An American chemist, born at Hudson, N. Y., and educated at the Philadelphia College of Pharmacy and in Strassburg. During 1880–83 he had charge of the chemical laboratories of the Philadelphia College of Pharmacy and during 1883–92 was professor of pharmaceutical chemistry and materia medica at the University of Wisconsin. In 1892 he became director of the laboratories of Fritzsche Brothers and in 1896 accepted an appointment in the Wellcome Chem-

ical Research Laboratories of London which he held until 1916 when he returned to the United States and was given charge of the phytochemical laboratory of the Chemical Bureau of the United States Department of Agriculture. His original researches were in connection with phytochemistry and with essential and fatty oils, especially the development of chaulmoogra oil as a remedy for leprosy. In addition to many scientific papers he was associated with F. Hoffman in the publication of the *Manual of Chemical Analysis* (1883).

POWER STATIONS. See ELECTRIC POWER STATIONS AND GENERATING APPARATUS; WATER POWER; STEAM TURBINES.

PRANDTL, LUDWIG (1875–). A German scientist in charge of experimental work on aërodynamics in the laboratory at Göttingen. He published with C. Wieselsberger and Dr. A. Betz *Ergebnisse der Aerodynamischen Versuchsanstalt zu Göttingen*, containing heretofore unpublished results of experiments, some conducted during the War, and some shortly after its termination. He is best known for the *Technische Berichte* included in his book.

PRATELLA, BALILLA (1880–). An Italian composer, born at Lugo. He was trained at the Liceo Rossini in Pesaro, taught at Cesena, and in 1910 became director of the Instituto di Musica at Lugo. He was one of the most active of the extreme futurists, both as composer and writer. He was the first to formulate the musical creed of the futurists, as early as 1915 (see MUSIC, *Recent Tendencies*). His writings, mainly attacks on established standards and institutions, offer nothing of constructive value. His compositions may serve as practical illustrations of his theories. He wrote the operas *Lilia* (Lugo, 1913), *La Sina di Vargoun* (Bologna, 1919), and *L'Aviatore di Dro* (Lugo, 1920); *Romagna*, five poems for orchestra; *La Guerra*, three dances for orchestra; *Inno a Vita;* chamber music, and pieces for organ and for piano.

PRATT, EDWARD EWING (1886–). An American commercial expert, born in Streator, Ill., and educated at Oberlin College (1906) and at Tulane University. For several years he was a Fellow of the Bureau of Social Research in the Russell Sage Foundation. From 1910 to 1912 he was assistant professor of economics and statistics at the New York School of Philanthropy. He was special investigator for important industrial and economic bureaus in New York City, and from 1915 to 1917 was chief of the Bureau of Foreign and Domestic Commerce in the United States Department of Commerce. From 1920 he was engaged in business. He lectured on foreign trade at Columbia University in 1921. His published writings include *Industrial Causes of Congestion of Population in New York City* (1911) and *Occupational Diseases* (1912), besides many articles on foreign trade and industrial betterment.

PRATT, JAMES BISSETT (1875–). An American professor of philosophy, born at Elmira, N. Y., and educated at Williams College and Harvard University. In 1905 he joined the faculty of Williams. With Santayana, Lovejoy, and others he published *Essays on Critical Realism* (1920). His other writings are concerned largely with the philosophy of the religious life. They include: *The Psychology of Religious Belief* (1907); *What Is Pragmatism?* (1909); *India and Its Faiths* (1915); *Democracy and Peace* (1916); *The Religious Consciousness* (1918); and *Matter and Spirit* (1922).

PRATT INSTITUTE. A nonsectarian, coeducational institution at Brooklyn, N. Y., founded in 1887, comprising Schools of Fine and Applied Arts, Household Science and Arts, Science and Technology, and Library Science. The entering enrollment for 1923–24 was 3722. The faculty consisted of 4 directors, 153 instructors, and approximately 65 lecturers. The library contained 109,098 volumes in 1914 as compared with 130,642 in 1923–24. President of the Board of Trustees and executive head of the institution, Frederic B Pratt; Secretary of the Board of Trustees, Charles Pratt

PRAY, JAMES STURGIS (1871–). An American landscape architect. In 1905–14 he was assistant professor of landscape architecture, and from 1914, Charles Eliot Professor, at Harvard University, and from 1908 chairman of the School of Landscape Architecture. From 1915 to 1920 he was Harvard adviser to the Cambridge Planning Board, meanwhile acting (1917) as city planning expert in laying out various army cantonments, and planning (1918) United States government towns for munition workers In 1920 he became chairman of the National Conference on Construction in Landscape Architecture. He was a member of many architectural societies and author of *City Planning*, with Kimball (1913).

PRESBYTERIAN CHURCH. The Presbyterian Churches comprise 10 branches, as follows: Presbyterian Church in the United States of America; Presbyterian Church in the United States (South); Cumberland Presbyterian Church; United Presbyterian Church; Colored Cumberland Presbyterian Church; Welsh Presbyterian Church (Calvinistic Methodists, united in 1920 with the Presbyterian Church in the United States of America); Associate Reformed Presbyterian Synod; Reformed Presbyterian Church (Old School); Reformed Presbyterian Church, General Synod; and Associate Synod of North America (Associate Presbyterian Church) The Presbyterian and Reformed Churches represent those features of the Reformation emphasized by Zwingli and Calvin.

As a whole, the various branches of the Presbyterian Church showed marked growth in the years between 1914 and 1924. The total number of members in the United States increased from 2,083,617 in 1914 to 2,948,140 in 1922. The members and adherents of the Presbyterian and Reformed Churches throughout the world, all holding the presbyterian system, and organized in a World Alliance for purposes of fellowship and coöperation, increased during the period from 35,000,000 to more than 41,000,000, exclusive of the more than 5,000,000 Reformed Lutherans.

In this country the largest of the Presbyterian churches is the Presbyterian Church in the United States of America. Its membership increased from 1,458,085 in 1914 to 1,803,593 communicants in 1923, and the number of Sunday school scholars from 1,318,628 to 1,499,890. The number of churches dropped from 10,130 to 9706, and the number of ministers was

increased from 9536 to 9979. Contributions in 1914 totaled $27,681,970, and in 1923 $50,430,097. Of the total for 1914, $2,401,972 was contributed for home missions, $1,562,800 for foreign missions, $891,654 for education, and $19,771,059 for general congregational expenses; and of the 1923 total $5,386,459 was contributed for home missions, $3,892,627 for foreign missions, $1,624,373 for education, and $35,591,650 for congregational expenses. The denomination maintained 11 theological seminaries in 1914 and 13 in 1923. The reports of the Board of Foreign Missions showed a decrease between 1914 and 1923 from 27 to 26 foreign missions, but an increase from 165 to 166 stations, from 1226 to 1428 missionaries, from 5766 to 6856 native helpers, from 728 to 1027 fully organized churches, and from 133,713 to 178,299 communicants The number of mission schools fell from 2074 in 1915 to 2034 in 1920, and the number of students from 81,183 to 78,733, but the number of Sabbath school scholars increased from 183,656 to 232,321, and the number of hospitals and dispensaries from 165 to 175. In 1919, the church launched the New Era Movement, designed to cultivate the interest and support of the church for its missionary and benevolent enterprises. Among other things, this effort was responsible for the greater part of the increase in giving for the 10-year period as noted above. In 1923, all the missionary and benevolent agencies of the church were completely reorganized, 16 different boards and agencies being combined into four boards as follows: The Board of National Missions, the Board of Foreign Missions, both with headquarters at 156 Fifth Avenue, New York, the Board of Christian Education and the Board of Ministerial Relief and Sustentation, with headquarters at the Witherspoon Building, Philadelphia.

For many years the General Assembly by formal action favored the union of all the Presbyterian Churches in the United States. Conferences with members of the same ecclesiastical family resulted in the formation of the General Council of the Reformed Churches, by which cooperative work was being conducted (1924), and that with a view to ultimate organic union. In 1920 actual union with the Welsh Calvinistic Church was effected. In 1918 the General Assembly proposed a conference with all evangelical churches looking to a closer unity, but the bodies participating for the most part concluded that the unity desired, for the present at least, can be secured through the existing Federal Council of the Churches of Christ in America. Overtures for union with the Congregational Church were (1924) under consideration by commissions appointed by the two bodies.

The Presbyterian Church in the United States, often called the Southern Presbyterian Church, became a distinct denomination in 1861. It increased its membership from 310,612 in 1914 to 411,854 in 1923, its churches from 3430 to 3492, and the number of its ministers from 1819 to 2056. Its theological seminaries numbered four in 1915, and five in 1923.

PRICES. Changes in price levels, in distinction from changes in the cost of living, are measured customarily from differences in wholesale prices of certain commodities. The commodities usually selected are those which have been available in the markets in uniform grade for some period of time and seem likely to continue to be so available in the future. In the United States the more important index numbers for wholesale prices are those of the United States Bureau of Labor Statistics, the Federal Reserve Board, *The Annalist*, Bradstreet, Dun, and the somewhat different type of index number recently established by Prof. Irving Fisher. Price changes in Great Britain are shown by the index numbers of the British Board of Trade, *The Economist*, and *The Statist* (Sauerbeck). For Canada, we have the index number of the Dominion Bureau of Statistics; for Australia, that of the Commonwealth Bureau of Census and Statistics; for France, that of the Statistique Générale; for Italy, that of Prof. Riccardo Bachi; for Japan, that of the Bank of Japan in Tokyo. Index numbers of wholesale prices are available also in many other countries. While there is always some variation in the amount of change shown by different index numbers in the same country as well as by those for different countries, according to the kinds of commodities selected as the basis for the index number and the way in which the prices of these commodities happen to be affected by current market conditions, there was a surprising uniformity prior to the War in the price trend shown by the indexes then available. Following a world-wide increase in prices over many years, a decrease in prices began about 1873 in all countries and continued until about 1896. An upward movement then began and was still in progress in 1914.

With the many and varied economic disturbances caused by the War, the accurate measurement of changes in price levels became increasingly difficult. Prices of certain articles rose rapidly, others but slightly. Elaborate systems of price-fixing were established in many countries; fairly high prices were fixed in some instances to encourage production, and in other instances fairly low prices were fixed to check profiteering, both in connection with large sales to the government and its allies, and in connection with retail sales to consumers. The general effect of price control in the United States is illustrated by the following table showing index numbers for a large number of commodities brought under official control between August, 1917, and November, 1918, in comparison with other commodities left uncontrolled.

WAR INDUSTRIES BOARD INDEX NUMBER
Separated into Controlled and Uncontrolled Prices
(Average Prices, July, 1913, to June, 1914=100)

	Controlled prices (573 commodities)	*Uncontrolled prices* (793 commodities)	*All commodities* (1,366 commodities)
1913 Year	100	102	101
1914 Year	100	97	99
1915 Year	102	102	102
1916 Year	125	124	126
1917 August	204	162	187

March	197	182	188
April	196	187	191
May	192	189	190
June	189	191	189
July	195	194	193
August	199	195	196
September	204	199	201
October	201	201	201
November	200	200	200
Year	197	191	194

In the European countries especially closely affected by the War, price control began much earlier than in the United States; a large number of articles were usually covered, and all price rulings were carefully enforced. In all countries, however, whether or not there was price control, uniform tendencies were found in price trend, indicating the strength of the forces which control changes in price levels in all parts of the world. As between 1913 and 1914, almost no change in price level was shown. A significant and continued increase beginning in 1915 culminated about October, 1918. During the winter of 1918–19 there were slight and irregular fluctuations in prices, followed by a period of rapid increase, until the peak was finally reached during the summer of 1920. Prices then fell even more rapidly during a year and up to 1924 remained relatively stationary with slight tendencies toward small increases in most countries, the exception being in the price indexes of countries with a depreciating paper currency, where obviously a marked increase in prices in paper currency may be shown even when there has been a decrease in purchasing power in relation to a fixed monetary standard. The differences in the price indexes for certain countries before and after conversion to a gold basis are shown by the following price indexes of the Federal Reserve Board of the United States.

FEDERAL RESERVE BOARD WHOLESALE PRICE INDEXES

ON PAPER CURRENCY BASIS

Year	United States	England	France	Canada	Japan
1913	100	100	100	100	100
1919	211	241		207	235
1920	239	310	512	250	240
1921	149	198	344	167	181

1922	158	150	136	147	175
1923	164	159	124	147	183

Although, as has been indicated above, a policy of price fixing was adopted during the War as a stimulus to production, there was little tendency to continue this policy longer than necessary for war purposes. This has been true also with reference to price fixing as a means of protecting purchasers from excessively high prices in relation to costs of production and distribution; every effort was usually made to restore as rapidly as possible earlier conditions of price control through free and open competition. The acute housing shortage in many countries necessitated the protection of tenants from rent increases until additional housing construction should have brought available supply of houses into closer relation to acute demand for housing accommodations. The rent restriction laws which were enacted in a number of European countries during or immediately following the War tended therefore to remain in force up to 1924. This is true also in the United States, where the New York Legislature voted almost unanimously in 1924 to extend until 1926 the emergency rent laws applying to certain cities where a housing emergency had been found to exist. In the District of Columbia also rent laws were in operation, but elsewhere in the United States little attempt was made after the War to control prices officially. See AGRICULTURAL CREDIT; FINANCE AND BANKING.

PRIESTLY, HERBERT INGRAM (1875–). An American educator and historian, born at Fairfield, Mich., and educated at the University of Southern California. He taught in California for several years and from 1901 to 1904 was a teacher and superintendent of schools in Luzon, P. I. Returning to the United States, he was superintendent of schools and teacher in California high schools until 1912, when he was appointed assistant curator of the Bancroft Library at the University of California. In 1920 he was librarian and also associate professor of Mexican history at that university. He wrote *José de Galvez, Visitor-General of New Spain, 1765–71* (1916), and many articles on Californian, Mexican, and Spanish-American history. In 1918 he was awarded the second Loubat prize at Columbia University for the best work on the history of North America during the colonial period. In 1920 he became editor of *The American Historical Review*.

PRIMITIVE MAN. See ANTHROPOLOGY.

PRINCE, MORTON. See PSYCHOLOGY, ABNORMAL.

PRINCE EDWARD ISLAND. The smallest of the Canadian provinces with an area of 2184 square miles. In 1911, the population was 93,728; in 1921 it had fallen to 88,615, or a decrease of 5.5 per cent The rural population was still preponderant though it declined as a result of the migrations to the cities; 84 per cent of the population was rural in 1911, and 78.5 per cent in 1921. Populations of the principal cities in 1921 were: Charlottetown, 12,347; Summerside, 3228.

Industry and Trade. Of the total 1,397,990 acres in the province, 1,216,483 acres were occupied as farms. Among the field crops hay and clover, oats, potatoes, and wheat received the most attention. Diversified farming, however, was the rule, the abundance of fodder crops making the live-stock industry particularly important. Stocks increased over the decade 1912–22 so that in the manufacture of butter and cheese the province was able to rank high in the whole Dominion. (In the manufacture of cheese it stood after Ontario and Quebec.) Total value for farm products was $15,929,000 in 1923. Fox breeding continued to be important and yielded about $1,240,000 in 1922 in pelts and live animals sold (pelts alone, $448,786). The fish catch netted $1,609,600 for 1922 as compared with $1,379,905 in 1913. Lobsters made up three-fourths of the total and were canned in local establishments. The vast oyster areas owned by the province had by 1922 still proved unsuccessful because of the importation of diseased oysters and the prevalence of pests. Manufacturing continued on a small scale. In 1921 the 446 establishments represented a capital of $2,452,826 ($2,013,365 in 1910), employed 1098 workers and added $1,575,684 by manufacture. Exports to foreign countries (1921–22) amounted to $415,870; imports for consumption to $954,549. In 1922, there were still 278 miles of railways, no construction having been done in the period.

Government. Revenues for 1922 were $748,888; in 1914 they had been $525,555. Expenditures for 1914 and 1922 were $445,396 and $687,-

241. Expenditures on education for 1913 were $261,641; for 1922, $428,869. Women were enfranchised and given the right to stand for the provincial assembly. Representation in Canadian Parliament: House of Commons, 4; Senate, 4.

PRINCE OF WALES. See EDWARD ALBERT CHRISTIAN GEORGE ANDREW PATRICK DAVID, PRINCE OF WALES.

PRINCETON UNIVERSITY. A nonsectarian institution for men at Princeton, N. J., founded in 1746. The enrollment increased from 1641 in 1914 to 2373 in 1922 when a limitation of number to about 2000 undergraduates was adopted owing to lack of housing and teaching equipment. In 1923, the total undergraduate and graduate enrollment was 2418. During the decade the productive funds of the university increased from $5,399,150 to $12,766,650; the faculty increased from 207 to 264; the library grew from 320,701 to 469,506. With the limitation of enrollment a selective process was instituted by which admission was based not only on scholarship but also on character.

Shortly after the outbreak of the War, voluntary military training was organized and in 1916 military science became for the first time a part of the curriculum. Summer camps were held in 1917 and 1918. The United States School of Military Aëronautics was opened in 1917, occupying four dormitories, the university dining halls and Palmer Physical Laboratory, and during its continuation until the Armistice 3714 cadets were registered, of whom 2458 were graduated. In 1918 the university came under government control through the Student Army Training Corps and the Naval Unit. In the same year the United States Navy Department installed in the Graduate College buildings a Navy Pay Officers School in which over 500 men were enrolled. A Radio Station of Research, a Bureau of Medical Research and a Bureau of the Sound Ranging Service of the Army occupied other university buildings, and extensive investigations in explosives and poison gases were conducted for the government in the chemical laboratory. Over 5500 graduates and undergraduates were in various branches of government service, upwards of 3000 being commissioned officers; 150 died in the War. Memorial scholarships were founded in the names of these men As a continuation of the Reserve Officers Training Corps maintained during the war period, a Reserve Officers Training Corps in Field Artillery was instituted after the War, commissioning selected students, on graduation, to serve as reserve officers in the United States Army.

The necessary reconstruction of the university on a more substantial financial basis led to a campaign for increasing its endowment. Of the $14,000,000 set as a goal, a total of $9,857,559 had been pledged and a sum of $7,513,593 collected by December, 1923.

The executive and administrative departments of the university were reorganized with a view to better coördination, and a system of cost accounting was installed, marking a new departure in university finance. Faculty autonomy and sympathetic coöperation between the board of trustees and the faculty developed to a degree remarkable in academic history. All questions of academic policy were discussed in joint council through a Conference Committee; a plan for systematizing faculty appointments, salaries, promotions, retirement and pension was in operation; the faculty had a voice in nominating its committees; representatives of the faculty sat with the Trustees' Committee on Honorary Degrees; and the rights of the individual in cases of dismissal were safeguarded. Student self-government made marked progress through the Student Honor Committee and the Committee on the Spirit of the Honor System and the participation of the Senior Council in matters of discipline. The Graduate Council was enlarged and a National Alumni Association centralized in one organization the 54 alumni associations in the country, the Council remaining the executive core of the new body The alumni trustees of the university were increased from five to eight, elected two each year by the alumni, to represent regional districts and to serve four years. President, John Grier Hibben, Ph.D., D.D.

PRODUCERS' COÖPERATION. See CO-OPERATION.

PROHIBITION. Prohibition is the term generally used throughout the United States to describe governmental prohibition of the manufacture, sale, and transportation of intoxicating beverages. As an outgrowth of the temperance and anti-saloon movements of many preceding decades, it became one of the outstanding issues of the decade since 1914. Many believe that prohibition by legislation and amendment was precipitated by the War. Federal or national prohibition is the culmination of various efforts to regulate and restrict the liquor traffic and is a sequence to cumulative local and State prohibition The term prohibition is being used to include activities similar to those just mentioned when they occur in other countries.

Local and State Prohibition. Prohibition early became effective through the exercise by communities of the privilege of "local option" in this matter, as extended to them through State legislation. In time, this local option extended to districts and to States; and until 1914 it was the prevailing form of prohibition in the United States. State-wide prohibition, by legislation and constitutional amendment, spread rapidly during the first few years of the decade 1914–24. At the close of 1913 only nine States had "gone dry." Eight of these, Maine, North Dakota, Kansas, Oklahoma, North Carolina, Georgia, and Mississippi, had adopted State-wide prohibition before 1910; West Virginia joined the procession in 1912. In some of these States the early enforcement legislation proved inadequate, and the States did not have what was commonly called "bone-dry" legislation until a later date. In Georgia, for instance, a State prohibition law was enacted in 1907 and became effective in 1908, but the enforcement was lax until more drastic prohibition legislation, passed in 1915, became effective in 1916; and even after this a so-called bone-dry law was passed in 1917 at a special session of the Legislature called to consider this issue. In 1914, four more States, Colorado, Oregon, Virginia, and Washington, brought the total to 13; and in 1915, three more States, Alabama, Arizona, and South Carolina, made the total 16. Alabama had enacted statutory prohibition in 1909 which was practically repealed in 1911 and reënacted in 1915. In 1916, seven additional States, Arkansas, Idaho, Iowa, Michigan, Montana, Nebraska, and South Dakota, made a total of 23, one less than half the number of States in the United States, but principally the less densely populated southern and

western States. In other States there had been a rapid extension of local prohibition under local option so that some of these States were half and a few three-quarters dry territorially. All of this occurred before the United States entered the War in 1917. State-wide prohibition continued to spread steadily, and before the Federal amendment had become effective in 1920, State-wide prohibition had carried in 10 more States. Four of these, Indiana, New Hampshire, New Mexico, and Utah, went dry in 1917; four, Florida, Nevada, Ohio, and Wyoming, in 1918; and two, Kentucky and Texas, in 1919. The amendments and legislation in many of these States did not become effective until the year following its adoption, and in several cases not until the second year thereafter. Prior to the time that the national prohibition amendment became effective, 33 States had adopted some form of State-wide prohibition, and many of the States had supplemented their early legislation with bone-dry legislation. It has been estimated that the dry territory at this time contained about two-thirds of the population of the United States, for some of the more densely populated States, so far as State legislation was concerned, remained "wet" until they came under Federal prohibition. Considerable sections of these 15 wet States were, however, under local prohibition. In 21 of the 33 dry States, the issue had been decided by popular vote, and in 12 by the respective State Legislatures.

Federal Prohibition Legislation. Federal action on this issue began in 1913 when the prohibitionists attained a majority in Congress, which up to 1924 they had never lost. The first act was the passage of the Webb-Kenyon Inter-State Liquor Shipment Act over the veto of the President of the United States. This act made illegal the shipment of liquor from a wet to a dry State. Although President Taft vetoed the bill because in his opinion it was unconstitutional, the Supreme Court handed down a decision (Jan. 8, 1917) upholding its constitutionality. Shortly after this decision, the Alaska Prohibition Act and the Porto Rico Prohibition Referendum were passed. The former placed Alaska under prohibition, the citizens of that Territory having expressed their preference in a vote in 1916. The latter provided for a vote on the matter in Porto Rico, and at a special election (July 16, 1917), prohibition was adopted, the legislation becoming effective Mar. 2, 1918. On Mar. 3, 1917, the President signed the District of Columbia Prohibition Bill which became effective Nov. 1, 1917. As a result of activities led by Senators Reed and Jones and by Representative Randall, there were passed as amendments to the Post Office Appropriation Bill provisions whereby the United States mails were closed to all advertisements of the sale of alcoholic beverages, including letters or newspapers containing the same, when addressed to any person, firm, corporation, or association in any State or Territory where the sale and manufacture of intoxicating liquors had been prohibited. These amendments included what was in effect an extended and more definite statement of the intent of the Webb-Kenyon Act. This legislation was also approved by the President on Mar. 3, 1917. In 1919 Senator Sheppard added an amendment to the revenue bill under consideration by the Senate, which, being adopted, made these Reed-Jones-Randall provisions effective with respect to the District of Columbia. During the War a number of emergency measures, restrictive and prohibitive, were passed, aiming to conserve the food and fuel supply and to protect the efficiency of the army and navy and of the workers in the war industries. Among these was the War Prohibition Act, passed Nov 21, 1918, and effective in July, 1919, which forbade until demobilization had been completed the sale for beverage purposes of distilled, malt, or vinous intoxicating liquors. This act continued to function until the Eighteenth Amendment became effective.

The Eighteenth Amendment. The general movement for Federal prohibition registered itself in 1914 when a resolution proposing a constitutional amendment received a majority vote in the House, and in 1916 when such a motion was reported by committee in the Senate. A resolution submitting to the States a national prohibition amendment to the Constitution of the United States was adopted by the Senate on Aug. 1, 1917, by a vote of 65 to 20, and passed with slight amendments by the House of Representatives on Dec. 17, 1917, by a vote of 282 to 128. The day following, the Senate concurred, and the resolution was adopted. The article of the joint resolution which is now Article XVIII of the Amendments to the Constitution was and is as follows:

1. After one year from the ratification of this article the manufacture, sale or transportation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof, for beverage purposes, is hereby prohibited.
2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.
3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures of the several States, as provided by the Constitution within seven years from the date of the submission hereof to the States by the Congress.

The Legislatures of the necessary three-fourths (36) of the States had ratified the amendment on Jan. 16, 1919. The ratification was proclaimed by the Secretary of State on January 29. Since that time 10 additional States have ratified. The States that have not ratified are Rhode Island and Connecticut.

Federal Enforcement Legislation. The National Prohibition Act, commonly known as the Volstead Act, was passed by Congress and submitted to the President, who vetoed it on Oct. 27, 1919. The same day the House voted to pass over the veto: yeas, 176; nays, 55; answering present, 3; not voting, 197. The next day the Senate voted to pass over the executive veto: yeas, 65; nays, 20; not voting, 11. This act fixed one-half of 1 per cent as the maximum of alcohol in nonintoxicating beverages. It placed responsibility for enforcement with the "Commissioner of Internal Revenue and his assistants." They were to "investigate violations" and to "report to the local United States Attorney," who must "prosecute offenders under the Attorney General's direction." The law provided for drastic enforcement of the amendment and established strict regulation of the distribution of liquor for the few specific uses permitted by the law. The United States Supreme Court on June 7, 1920, in a unanimous decision sustained the validity of the Eighteenth Amendment and of the Volstead Act.

The Enforcement Unit. The Prohibition Unit is a complex body with ramifications through the executive departments. Its organization has been much criticized on this score

and the consequent possibilities of "passing the buck." It has been defended on the count that all these agencies are needed for approaches to effective enforcement. The Federal Prohibition Commissioner is under the Commissioner of Internal Revenue, who is under the Secretary of the Treasury, who derives his policies from the President of the United States. He works with postal inspectors, the Bureau of Investigation of the Department of Justice, the Secret Service of the Treasury Department, the internal revenue officers in charge of income tax, custom officers and the Coast Guard. The principal weakness lies in the fact that the apprehension of violators is in one government department, and their prosecution is in another. This division of responsibility raises obvious questions as to efficiency

Adjustments of State and National Regulation. Prior to the decade 1914–24, prohibition enforcement had been a right and privilege of the several States. The provision of "concurrent power" in prohibition of alcoholic drinks and narcotics brought up some very involved problems of adjusting the relations of two governments acting in legal independence in the same territory. The repeal of the New York prohibition law 87 caused considerable stir and left that State with only the Volstead Act as a means of enforcing the Eighteenth Amendment. Nevada, having repealed her old acts, was embarrassed when her Supreme Court declared her new act unconstitutional and thus left her in much the same plight as New York. Among the most interesting adjustments of State law are the following. Pennsylvania defines as intoxicating beverages those so declared by "Acts of Congress passed . . . from time to time." In Illinois, if death results from poisonous liquor sold "for beverage purposes" the sale is murder. Similar legislation has been passed in Oklahoma and Tennessee, and in Iowa the sale or giving is manslaughter. Oregon 180 opens the State courts to abate nuisances under the national act, and either State's attorneys or Federal officers may prosecute. One of the most conspicuous incidents of Federal-State-municipal coöperation was in Philadelphia, where Governor Pinchot, Mayor Kendrick, and General Butler effected a signally drastic enforcement.

Anti-Saloon League of America. The agency more responsible than any other for leadership in the State and national prohibition legislation during the decade was the Anti-Saloon League of America. Organized in May, 1893, it is frequently described as "the church in action against the saloon." It is properly credited, both by its friends and its enemies, as having been chiefly responsible for the rapidly increasing sentiment in favor of prohibition. It is organized by States and acts as an agent for the churches in matters concerning the annihilation of the liquor traffic. The League established national propaganda headquarters at Washington, D. C., in 1915, and in 1916 it launched the national campaign for the amendment of the Federal Constitution. It has kept corps of trained men at the national and at State capitals to represent its constituency. It has examined the practices of representatives of the people and inquired into the attitude of candidates for public office, insofar as these related to prohibition, and opposed those who did not, regardless of party affiliation. Since the adoption of the Eighteenth Amendment and the passage of the Volstead Act, it has turned its energies to the difficult task of promoting law enforcement, to project a programme of Americanization, and to carry on the work of prohibition in foreign countries. For the latter purpose, the World League against Alcoholism has been formed. The avowed purpose of the new organization is "to attain by means of education and legislation the total suppression throughout the world of alcoholism." It pledges itself to "avoid affiliations with any political party as such, and to maintain an attitude of strict neutrality on all questions of public policy, not directly and immediately concerned with the traffic in alcoholic beverages."

Opposition. There has been much opposition ranging from unreasonable pressure of self-interest to rational judgments concerning the best interests of public welfare. Among the latter are the "laissez-faire" group who generally oppose governmental control, those who oppose all laws tending to fix status, those who oppose Federal action in what has been hitherto a States' right, those who oppose the use of the Federal Constitution for what they regard as a legislative function, and those who are opposed to the Volstead Act as a method or as an interpretation of the amendment. Henry W. Jessup stated that "if the Federal government has the right to make a sumptuary law of any description, it will have a right to make sumptuary laws of every description" President Nicholas Murray Butler of Columbia University claimed that "the amendment introduces for the first time a specific and almost unamendable and irrepealable police regulation into a document whose purpose was to set up a form of government and limit its powers." He further said that it is generally admitted that "the Amendment itself is not only a violation of the principles on which our government rests, but a revolutionary departure from them." There is also considerable popular opposition which hangs on to slogans and shibboleths, many of which have little or no basis in fact and are principally clever inventions of propagandists.

Labor Attitude. The American Federation of Labor, "as the spokesman of the unorganized as well as of the organized toilers," published a statement that it had been "decided by unanimous vote in its convention held in Denver in June, 1921, that the Volstead Enforcement Act must be modified so as to promote the manufacture and sale of beer and light wines." They claimed the act to be "an improper interpretation of the prohibition amendment—a social and a moral failure—a dangerous breeder of discontent and of contempt for all law" In a poll, however, of 526 labor leaders taken by *The Literary Digest* in March, 1920, 345 voted that prohibition was a benefit to the workingman, 143 voted that it was not, 31 were doubtful, and 7 claimed that it had not had a fair trial.

Social and Economic Consequences of Prohibition. Many statistics have been compiled in order to prove both the good and the ill effects of prohibition. Coming as it did at the close of the War, when all the social and economic factors were disturbed and all indices were turbulent, it is difficult to prove just what are postwar and what are postprohibition reactions. The very careful studies compiled by the Research Department of the Federal Council of Churches of Christ in America are the most significant available. The

studies have included an analysis of crime, deaths from alcoholism and cirrhosis of the liver, alcoholic psychoses, drunkenness, savings, poverty and relief, and all the other vital social changes which might have been consequences of prohibition Although the period of time is short, the data limited and not too good, and the researches as yet far from complete, there seems to be a "typical curve" of beneficial effects, especially in the northeastern industrial and densely populated areas most affected by national prohibition. This "typical curve" seems to indicate a maximum benefit from prohibition in 1920 and a regression of benefit since that time but not as yet a regression to preprohibition conditions. It is presumed that this regression was in part due to increased traffic in and consumption of alcoholic beverages.

Law Observance Campaign. This tendency toward disregard of the prohibition laws, together with a general tendency to regard all law more lightly, called forth protests and various demands for the observance of law and order. The outstanding activities were those inaugurated by the Citizenship Conference held in Washington, D. C., in October, 1923. Called by Fred Smith, one of the secretaries of the Federal Council of Churches, it assembled delegates who represented nearly every phase of religious, educational, social, and welfare organizations, as well as commercial and labor bodies It opposed the alleged prevailing tendency toward disregard of law and the unique attacks on the Eighteenth Amendment and Volstead Act which tended to nullify them. This body organized permanently as the Citizenship Committee of One Thousand.

Effects of Prohibition. It was impossible in 1924 to record many, if indeed any, of the permanent important social changes that have resulted from the adoption of prohibition as a national public policy. Considerable time is required before the more fundamental social and economic changes consequent on so extensive a social adjustment properly register themselves. Observations at this time were necessarily limited to the consideration of the most immediate and perhaps the least significant effects. Any attempt to appraise properly the more remote effects must be based on opinions of estimable men concerning these probabilities. In respect to the more immediate effects, it was generally conceded that there was little trustworthy evidence available and that most of the so-called evidence was more nearly propaganda or was at least colored by "wishful thinking," however honestly it might have been intended. It is very worth while to inquire as to the effect which the prohibition activities have actually had on the consumption of alcoholic beverages. Until the facts regarding consumption are established it is difficult to draw conclusions as regards changes due to diminished consumption.

The Consumption of Liquor since Prohibition. The consumption of liquors has been of two sorts, legal and illegal. The former covers especially consumption for medicinal and sacramental purposes and conversion for industrial alcohol The latter included irregular withdrawals from warehouses, domestic manufacture, and smuggling The facts regarding the withdrawal of bonded liquors from bonded warehouses are comparatively definite. The "peak" of the annual withdrawals of liquor of this sort occurred in 1917, during which year 160,000,000 gallons were taken out of bond. In 1923 about 11,000,000 gallons were thus withdrawn. At the beginning of the decade there were 285,000,000 gallons in bond and in 1923 but 45,000,000. It is self-evident that this source of supply could not long continue, and the activities of the Enforcement Unit were operating to make more difficult the removal of the balance for illicit purposes The commercial manufacture of high alcoholic drinks seemed to have been abandoned by almost all of those engaged in this business prior to 1920. The consumption of beer is quite another matter. Prior to prohibition, beer constituted by volume 90 per cent of the liquor consumed in the United States The American Brewers' Association estimated that the total 1924 production of beer was about 20 per cent of what it formerly was, and there are reasons for believing that this is a fairly liberal estimate Creditable estimates place the number of brewers brewing "beer substitutes" at about one-third of the number of preprohibition brewers. Some of these claimed to be operating at a loss, with a hope that the one-half per cent maximum alcoholic content fixed by the Volstead Act might be raised. Many breweries were manufacturing "near beer," advertised as "brewed exactly as before." It was made exactly as before, but the excessive alcoholic content had to be distilled off before the beer left the breweries. An exact check-up of this latter process presented many difficulties, and even when it was accomplished, consumers and "bootleggers" contrived in various ways to restore the alcoholic content

"Home-brew" activities spread rapidly. All efforts to gauge their extent in the aggregate were relatively futile. The various studies made of the consumption of commodities essential to home brew, such as malt, rye, hops, yeast, etc., and of the sale of apparatus for the purpose, were full of errors and of doubtful hypotheses. There was much illicit manufacture of wines. This was somewhat reflected in the enormous traffic in grapes, which, however, must be considered also in relation to the general increase in the traffic in fruits and the increased use of grapes for unfermented grape-juice products. The Secretary of the United States Brewers' Association estimated that the shipments of grapes from California, New York, Michigan, and Pennsylvania in 1922 would make over 1,250,000 gallons of wine. There were many ramifications of these activities, some of which were merely more extensive activity in ancient practices such as the making of hard cider and of "apple-jack." Many prominent social workers were inclined to look on these activities, especially home-brewing, as temporary reactions; novelties which were troublesome, expensive, a general nuisance, and which at best yielded unsatisfactory products of amateurs They did, however, furnish a very considerable supply of alcoholic beverages for local consumption.

The manufacture of synthetic liquors, commonly called "hootch," resulted in much sickness and many deaths. About 80,000 samples of alcoholic liquors were examined during the year 1922–23. In his report to the Prohibition Commissioner dated Apr. 24, 1923, Dr. Doran, head of the industrial alcohol and chemical division of the Prohibition Unit, stated that "it is noticeable that the percentage of genuine whisky in all the samples examined in our

laboratories is not as great as it was nine months or a year ago, and I now find that of 5000 samples of distilled spirits submitted to the laboratory during the last six months not over 50, or 1 per cent, are genuine whisky." Smuggling activities along the Atlantic coast and over the Canadian border served as a source of supply for a lively bootlegging industry in the northeastern section of the United States. This fact was generally admitted by both the enemies and friends of prohibition. It was of course difficult to estimate the extent of these activities. The business seemed to be of such size as to absorb the heavy losses which came through frequent large seizures and consequent penalties. In 1918 importations of spirituous liquors into the nearby Bahama Islands was negligible; in 1920 it amounted to 160,000 proof gallons, and data compiled by the British Premier made it about twice that amount for 1922, a rather good supply for a very small base. Enforcement officials looked for a reduction in smuggling as a result of treaty arrangements and a breaking-up of the "rum row" by the strengthening in size and speed of the Coast Guard as a result of appropriations made by Congress on Apr. 2, 1924. A convention signed with the Canadian government in June, 1924, arranged for cooperation in suppressing illicit traffic in liquors and narcotics between the two countries.

Research. In no issue of its size before the public was it so difficult to obtain accurate, comprehensive information in regard to social and economic consequences as in this. Researches of the Federal Council of Churches revealed a distressing paucity of unprejudiced data. An extensive and intensive research for the enlightenment of public opinion on the immediate and probable remote effects of prohibition was needed

Liquor Regulation in Other Countries. In Canada, some of the provinces had prohibition; some, regulation. Prohibition was in effect in 1924 in Prince Edward Island (1907); Saskatchewan (1915); Alberta and Nova Scotia (1916); New Brunswick and Newfoundland (1917); Yukon Territory (1920) British Columbia adopted prohibition in 1916 and changed to state control in 1921; Manitoba adopted prohibition in 1916 and state control in 1923; Ontario went dry in 1916 and adopted state control in 1919; Quebec had government control. In England during the War the liquor traffic had been variously regulated, in zones about army and navy stations, and where war material was being handled; in 1921 a bill imposing somewhat similar restriction was enacted, for the country as a whole, to regulate hours of sale and alcoholic content of hard liquor. National prohibition was defeated (Apr. 20, 1923) in the House of Commons by a vote of 236 to 14. Finland, after having its prohibition legislation twice annulled by the Czar under the old régime, in 1917 again passed a prohibition law, effective in 1919. In Norway, as a result of a referendum in 1919, traffic in liquors containing over 14 per cent of absolute alcohol was forbidden; but following the threat of France, Spain, and Portugal to bar the fish products of Norway if her wine importation were cut off, the alcoholic content in 1923 was raised to 21 per cent. For a similar reason, Iceland's national prohibition act of 1908 also was suspended temporarily, in 1922, to allow the admission of liquors containing up to 21 per cent of alcohol from Spain. Local option obtained in parts of Holland, Belgium, Scotland, Poland, and Denmark (where a uniform local-option bill failed in the upper house in 1919); and some measure of regulation was being exercised in Germany, Austria, Northern Ireland, Japan, Mexico, and many South American countries. Federal control and taxation of liquor was defeated in Switzerland in 1923; and in that year, according to reports, the Turkish Empire adopted nation-wide prohibition. The prohibition of the liquor traffic in Russia during the War did not apply to the light wines of the southern regions, which were subject to local veto; and certain phases of the vodka trade were afterward reestablished as a government monopoly.

National and International Temperance Organizations. The following bodies were permanently organized for the promotion of temperance and the prevention of alcoholism: World League against Alcoholism; World's Woman's Temperance Union; Permanent International Congress on Alcoholism; International Order of Good Templars; Sons of Temperance; World Student Federation against Alcoholism; Intercollegiate Prohibition Association; World Prohibition Federation; National Temperance Council; National Legislative Conference; Scientific Temperance Federation; National Temperance Society; International Reform Bureau; Woman's Prohibition League of America; Committee of One Thousand In addition there are the various boards of churches and church federations. See LAW, PROGRESS OF THE.

PROJECTILE. During the War, several new types of shell were given trials; some seemed likely to come into general use. T.N.T. (trinitrotoluene) became the explosive generally used in the bursting charge in place of picric acid compounds and gunpowder. (See EXPLOSIVES.) The use of common shell with thin walls and extra heavy bursting charge, in fleet action, was practically given up. The nonricochet or "diving" shell, so designed that it would even at a low angle of impact enter the water and nearly maintain its aërial direction, was devised for use against submarines, and the models brought out near the close of the War were efficient The gas shell, so effective in land operations, was little used at sea, although gas shell and aërial gas bombs are likely to be important features of naval warfare in the future unless barred by international agreement. Illuminating shells were used to some extent and were generally adopted as a necessary naval equipment. They may be fitted to burst in the air or on contact with the water and illuminate nearby objects. Smoke shell, producing a large volume of dense smoke, have a limited usefulness Anti-aircraft shell, fitted with night and day tracers giving out visible lines of fire or smoke, were still undergoing improvement in 1924. Gas, explosive, and depth bombs (see BOMB, DEPTH, and BOMBING OF VESSELS) are partly projectile in character and seemed to have an ever-increasing field of usefulness. See GUNS, NAVAL; ARTILLERY; ORDNANCE.

PROKOFIEV, SERGEI (1891–). A Russian composer, born at Sontsavka in southern Russia Having received his first instruction from his mother, he entered the Petrograd Conservatory in 1904 and studied piano with Essipov and composition with Liadov and Rimsky-Korsakov. Graduating in 1910, he won the Rubinstein prize. He made several tours as a

pianist, appearing in the United States in 1918. As a composer he belongs to the extreme futurists. His works include the operas, *Maddalena, The Gambler* (Petrograd, 1916), and *Love for Three Oranges* (Chicago, 1921); a ballet, *Le Bouffon;* a *Sinfonietta;* a symphonic poem, *Dreams; Scythian Suite* for orchestra; a *Classical Symphony;* a violin concerto; two piano concertos; *Conjurements* for soli, chorus, and orchestra; and miniature bits for piano and songs.

PROTEINS. See FOOD AND NUTRITION.

PROTESTANT EPISCOPAL CHURCH. In doctrine this religious body is similar to the Church of England, from which it is descended. It recognizes three orders in the ministry—bishops, priests, and deacons; the diocesan bishops are elected by the clerical and lay members of the convention of the diocese. The number of communicants of the denomination grew steadily from 1,015,248 in 1914 to 1,143,801 in 1923, the number of clergy from 5538 in 1915 to 6024 in 1923, the number of Sunday school pupils from 462,221 to 476,375, and the number of teachers and officers from 52,534 to 53,992. The number of parishes increased from 8098 in 1918 to 8242 in 1923. At the General Convention in 1919, a new canon was adopted providing for the organization of a permanent executive body, called the Presiding Bishop and Council. In 1922, the name was changed to National Council. Among other things, this council was to exercise all the powers of the Domestic and Foreign Missionary Society, and have charge of the unification, development, and prosecution of the work of missions, church extension, religious education and Christian social service. However, the Missionary Society retained its corporate existence and continued to receive and hold bequests, trust funds and title to property of all kinds. In the United States, the church carried on extensive work among the Indians, the negroes, the southern mountaineers, and the foreign-born, while work with deaf mutes, and in rural and industrial centres, became increasingly effective. The church's influence was also felt in the remote parts of the republic—in Alaska, the Philippines and the Hawaiian Islands, the Canal Zone and the possessions in the West Indies. Abroad, work was carried on in China, Japan, Liberia, Mexico, Brazil, Cuba, the Dominican Republic, and Haiti. In 1919, a movement, known as the Nation-Wide Campaign, was inaugurated, the purpose of which was to increase interest in the missionary work of the church at home and abroad. One result of this movement was that the giving of the church for all purposes was in 1920 more than $10,000,000 larger than in 1919 and grew larger each year thereafter. See REFORMED EPISCOPAL CHURCH.

PROUST, MARCEL (1873–1922). One of the leading French writers of the twentieth century, born in Paris. Proust, like his fictional hero Swann, was a man of the world and seemed to his friends to be nothing more than a man of the world with perhaps an amateurish interest in letters. At the age of 45, Proust had published only two French translations of Ruskin, *The Bible of Amiens* and *Sesame and Lilies*, and an original volume, *Les Plaisirs et les Jours* (*Delights and Days*). It was in the preface to the latter volume that Anatole France indicated that Proust "delights equally in describing the desolated splendor of the setting sun and the agitated vanities of a snobbish soul." A man of feeble constitution, Proust alternated his mundane parties with seclusion in an invalid's bed. It was thus that he prepared himself to be the fictional Saint-Simon of French society of the *fin de siècle*. In 1914 he began the publication of his fictional notebooks, an 11-volume novel, *A la Recherche du Temps Perdu* (*In Search of Days Gone By*). Four or five additional volumes, which he had completed but not corrected at the time of his death, remain (1924) still to be published. Public attention was attracted to Proust's work in 1919 when the section of his novel called *A l'Ombre des Jeunes Filles en Fleurs* (*In the Shade of Budding Young Girls*) won the Prix Goncourt. He was hailed immediately as an eccentric literary genius who wrote from imaginative reminiscence instead of from imaginative construction. He described his literary method in the *Coté de Guermantes*. For reference consult Lalou's *Histoire de la Littérature Française Contemporaine*, pp. 630–645 (1923).

PROVIDENCE. The capital of Rhode Island, and the second city of New England. The population increased from 224,326 in 1910 to 237,595 in 1920 and to 242,378 by estimate of the Bureau of the Census for 1923. An extensive plan for improvement of the port was started in 1918. The city appropriated $800,000, the State $1,500,000, and the Federal government $1,000,000 to have the harbor deepened and a straight thirty foot channel dredged to deep water. The State built a large pier with a two story steel shed 400 by 100 feet, and the city built a quay 3000 feet long in thirty feet of water at mean low tide, equipped with complete freight handling apparatus and railroad connections. The new Scituate Reservoir was built with a dam 3200 feet long and 100 feet high. A seven-mile aqueduct brought the water to a new filtration plant. A zoning ordinance was adopted in 1923.

PRUSSIA. In the early part of 1914 there was a good deal of protest on the part of the Prussian Conservatives against the imperial policy of Bethmann-Hollweg, which they alleged worked to the prejudice of the position of Prussia in the Empire. The appointment of the Prussian Minister of the Interior, Von Dallwitz, to the post of Statthalter of Alsace-Lorraine removed the most violent opponent of Prussian Franchise Reform. But the sanguine hopes which had been placed on his successor, Von Loebell, were soon shattered by the latter's inaugural speech in the Diet, in which he stated that he had no intention of drawing up a Franchise Bill. The outbreak of the War temporarily forced all internal questions into the background, but the problem of internal reform in Prussia could not long be ignored. During the budget debates in the Diet of March, 1915, the Poles and the Danes abstained from voting and at the same time voiced their protest against the repressive measures which the government had seen fit to continue against these nationalities in spite of their unquestionable loyalty in the War. At the same time the Socialists voted against the Prussian budget because of the unwillingness of the government to grant a democratic franchise and the right of free combination to the masses. The Prussian war measures dealing with the economic situation were similar to and worked in complete harmony with

the corresponding imperial measures. On Jan. 13, 1916, the Chancellor appeared before the Prussian Diet with a promise of electoral reform, but stated at the same time that it must be deferred until the end of the War. The government was forced, however, to abandon this position as a result of the changes in the foreign and internal situation during 1916 and 1917 and particularly in consequence of the ever-growing opposition of the Reichstag majority. Hence the more liberal Hertling government, installed late in 1917, introduced during November of the same year reform measures which, while making certain progress in regard to electoral reform, curtailed substantially the rights of the Lower House in the matter of the budget. After much wrangling the bill was finally adopted on Oct 24, 1918, but then the situation had gone too far to be capable of being remedied by mere electoral reform.

The revolution of November, 1918, did away with the dynasty, Prussia's position of hegemony in Germany, and the personal union between the German and Prussian governments. A republic was proclaimed, the House of Lords was abolished and the Lower House dissolved. On Nov. 15, 1918, a ministry, consisting for the most part of Socialists, was appointed by the Executive Committee of the Workers' and Soldiers' Council. The result of the elections for the Constituent Assembly on Jan. 26, 1919, was as follows: Majority Socialists, 145; Independent Socialists, 24; Centre, 88; Democrats, 65, German People's party, 21; German National party, 50; Hanoverians, 7. The revolutionary period proper ended with the convening of the Assembly on March 13 and the promulgation of a provisional constitution. Thereupon the Socialist Hirsch formed a coalition cabinet, consisting of Socialists, Centrists, and Democrats, which was succeeded after the Kapp Putsch in March, 1920, by a similarly constituted coalition ministry under the Socialist Braun. The new constitution of Prussia was completed by the Assembly after many difficulties on Mar. 30, 1920. It was drafted under the decisive influence of the constitution of the Reich and merely carried out the instructions of the latter. In it the attempt was made to bring about closer union with the Reich and far-reaching decentralization within Prussia. When the elections for the Diet in February, 1921, resulted in a strengthening of the extreme Right and Left, the formation of a new ministry was made very difficult and only on April 22 did the Centrist Fehrenbach succeed in forming a coalition of Centrists, Democrats, and experts. In the Braun ministry of November, 1921, this coalition was broadened so as to include the Socialists and the People's party During the last years of the period 1914–24, Nationalism and Communism grew apace in Prussia as in all other parts of the Reich. In March, 1923, Minister of the Interior Severing dissolved the activist organizations of the Monarchists and prevented the Communists from forming "fighting unions." In the early fall of the same year an insignificant and unsuccessful Monarchist coup was attempted in the fortress of Kuestrin in Brandenburg.

Prussia suffered severely under the Peace Treaty of Versailles. She lost the province of Posen, the larger part of West Prussia, parts of East Prussia, Silesia, Schleswig-Holstein, and the Rhine Province, in all 56,000 square kilometers with approximately 4,700,000 inhabitants. The conditions resulting from the Peace Treaty, the antagonism of the provinces to the Berlin government, old particularistic aspirations, and the intrigues of the French, combined to bring about during the first years after the Armistice various movements aiming at the separation of individual provinces from Prussia and the breaking up of the state into several states within the Reich. By cleverly making use of an old Rhenish distaste for things Prussian, the French endeavored for a long time to create an independent Rhenish buffer state and after lavish expenditure of money and much effort succeeded finally in the fall of 1923 in setting afoot with the help of all sorts of disgruntled and disreputable elements a Rhenish Separatist movement. The Separatists found very little response among the Rhenish population and were protected from the wrath of the Rhinelanders only by French and Belgian bayonets. Once the support of the armies of occupation had been withdrawn the movement quickly collapsed As a defense measure against Separatism, the Rhenish people organized a movement for an autonomous Rhenish state within the Reich The portion of Upper Silesia which remained German voted to form, as heretofore, a part of the Province of Silesia and of the State of Prussia instead of becoming, as had been the offer, a separate Prussian province or an autonomous state. The prolonged clamor of the Hanoverian autonomists induced the Prussian government to give the question of autonomy for Hanover a test and hence instituted, in the spring of 1924, proceedings in conformity with the provisions of the constitution of the Reich to bring about a plebiscite. Upon the failure of initiative petition to receive the required indorsement of the people, the matter was abandoned for the time being No doubt the feeling that in view of Rhineland Separatism the time was not propitious for such a plebiscite was largely responsible for the unfavorable verdict.

PSYCHOLOGY. A historian of contemporary psychology is compelled inevitably to become an interpreter and critic even more than an objective chronicler. With the conflicting aspirations of the various schools, with the different methodologies and points of approach, it is manifestly impossible to do even-handed justice to all claims and to all discoveries. Yet it is possible to attempt with the broad sympathy of a noncombatant to evaluate more or less adequately the more significant contributions of the rival schools. This is the task of the present article.

In the decade after 1914 there were two important challenges to the school of experimental psychology, which had arrogated to itself, not without some justice, the label of scientific psychology. These challenges were made by the doctrine of behaviorism (q.v.) and by the German theory of the *Gestaltpsychologie* (see PERCEPTION). The system of psychology which they challenged is the so-called structural or introspective psychology, developed in Germany by Fechner and Wundt and in the United States by the Cornell school of Professor Titchener. In

a few words, what this school sought to do was to correlate psychological facts as observed introspectively with physical or physiological phenomena as recorded by the best laboratory methods. With the purest intentions in the world, the psychologists of this school did not avoid making metaphysical assumptions, which were confusing both to themselves and to their opponents.

Everybody knows that there is not a one to one correlation between a stimulus as physically defined in terms of social discourse and the impressions it may arouse in a human being's conscious experience. All the arts which employ illusion in one form or another—the pictorial and theatrical arts, to mention but two examples—depend upon this fact. What structural psychology attempted to do was not merely to observe empirical correlations and discordances between these types of phenomena but to transform them into an explanatory system. To do this, the theory of psychophysical parallelism was borrowed from philosophy and adapted with a special signification for psychological problems.

Where the man in the street regarded mental events as causes of physical events and physical events as causes of mental phenomena, the parallelistic doctrine kept the two series radically distinct. As the doctrine was applied in psychology, it meant that for every simple physical event, that is to say for every stimulus, there was a *corresponding* sensation in the mind. At this point the physical series was abandoned and attention directed to the mental series—how from theoretically simple sensations there are built up the complexities of mental life, the perceptions, memories, and logical inferences. The analytic study of these mental processes, with correlation wherever possible to underlying physiological changes, made up what was known as structural psychology.

But the task of applying analytic language to "mental stuff" was never satisfactorily met. The simple sensation could not be isolated in introspection, so that the structuralist school was compelled to build its mental world out of attributes, or dimensions of sensations—quality, duration, intensity, extensity, and clearness.

Now at the beginning of the decade under consideration the doctrine of attributes and sensations had become pretty well shaken. In a doctoral dissertation on "The Relation of Sensation to Other Categories in Contemporary Psychology" (*Psychological Review Monographs*, vol. xvi, no. 67), C. Rahn had pointed out the frailty of the ideological structure, as well as the difficulty of distinguishing between clearness as a sensory attribute and clearness as a quality of a cognitive situation. Partly as a result of this attack, partly through internal development, the Cornell school after 1914 leaned less and less on the concept of sensation. Instead they developed a conception of mental life as a fluid process, with the standard attributes as the dimensional components of this process.

Such a conception tended to obliterate the distinction between sensory experience and the higher mental processes. In fact, C. M. Ogden definitely raised the question (*American Journal of Psychology*, 1922, vol. xxxiii) whether the traditional distinction between sensation and perception should be maintained any longer. The Cornell school hesitated to accept this radical solution, inasmuch as it would have thrown all differentiation of psychological experience into the problem of meaning.

In the meantime, the absorption of this school with the introspective phase of psychological theory could not but disappoint those who were impatiently expecting positive contributions from psychology for the control of human nature. Radical behaviorism, that is to say, the reduction of psychology to externally observable data, furnished one solution. In American psychological periodicals the topic of behaviorism provided most of the heat and a little of the theoretical light on the problem of mental analysis. Behind the clash of schools, there was really a conflict of metaphysical systems, each system being built around a particular technique or method of analyzing phenomena. By themselves, the method of introspection and the method of observing external reactions are not involved in contradiction. But unfortunately it is difficult—and for many persons almost impossible—to separate methodology from metaphysics. Thus very few psychologists were able to distinguish the behavioristic method from the behavioristic metaphysics as championed explicitly by Holt and Perry and implicitly by Watson. And it was also a common charge against introspective psychology that it led to a mentalistic view of the universe, that is to say to a subjective idealism; although if this charge were taken seriously, it would mean that no person could ever resort to introspection without running the risk of becoming philosophically a subjectivist.

As we pass to some of the other "systems" of psychology, we find it again necessary to separate the essential method from the accretion of dogmatism. In Professor McDougall's *Outline of Psychology* (1923), the conception of instincts and dispositions forms the basis of his total psychological structure. However, the urge to system building makes him entitize or hypostatize these instincts, and the result is a crude animistic monadology scarcely different from the ancient eschatologies. (See his presidential address before the British Society for Psychical Research, 1920). Yet instincts are valid conceptions when interpreted in their context, that is to say in connection with the study of human nature from a historical, biological, or moral point of view.

The difficulty lies in the coördination of such concepts, which are qualitatively of a different order from the concepts of physics, with the rather rigid structure of laboratory science. This genuine difficulty, instead of being faced in the same manner as we face differences of language among men, gave rise to a babel of misunderstanding between the mechanistic psychologists and the purposive psychologists.

The tendency to put all notions on the same plane of existence is also illustrated in the *Psychological Principles* of James Ward. The mind is said to exist, together with its powers of feeling, judging and ideating, and the external world is said to exist. But as the notion of existence is based upon physical experience, the mind is thus turned into a suprasensible substance. To be sure, Professor Ward makes his mind a stream of consciousness, but even this does not avoid the paradox of dualism, that is to say of two forms of existence. To appreciate this paradox, it is enough to point out that if we start on the psychological side, with the self, it is impossible to get back to the external

world; and if on the other hand, we begin with the realistic thesis of the external world, we find consciousness a troublesome superfluity. The way the dilemma is commonly avoided is by accepting from the common sense tradition both theses at once, regardless of their contradictory nature when taken in the raw and without interpretation.

The late Theodore Merz in his *Fragment on the Human Mind* invented an expression which is calculated to dispel confusion in this field. He speaks of the "firmament of thought" underlying the phenomenal stream of consciousness that we attain to by introspection The firmament of thought, containing within it that system of spatial relations which we call the external world, is much vaster than the temporal flow of awareness, but yet all our organized knowledge—ultimately resting on the great firmament—passes through the level of consciousness in order to be intellectually organized. If we may resort to an everyday set of metaphors, we may compare the introspective consciousness to the retail stock in trade of an industry. However, in this case we cannot observe the manufacturing end but we may only infer its processes from the table of purchases and sales. When we forget the practical problems of merchandising and just revel in the retailing activity, we do something that corresponds closely to introspection.

If our comparison is legitimate it is clear that the introspective method will never result in a systematization of the introspective consciousness. To the extent that it is systematized, to that extent it loses its character as the psychological stuff of immediacy. This fact is all the more obvious when we deal with the affective phase of conscious life. An intellectual schematism gives only the bare formal outline of the sentiments, not their "matter"; yet we cannot say, as a number of modern psychologists have attempted to say, that emotions are sugar in the blood or adrenalin secretion in the endocrine glands Such questions concerning the nature of the stuff of consciousness or of the stuff of emotions become factitious when we realize that we are plunged in immediate conscious experience and that our natural knowledge is but an effort to hold fast to a few bits of this conscious experience as the guiding norms and framework around which to organize our future and past experience. To quote a remarkable sentence from Goethe, "Sympathy and enjoyment in what we see is in fact the only reality, and from such reality, reality as a natural product follows."

PSYCHOLOGY, ABNORMAL, AND PSYCHOANALYSIS. If one accepted the standard division of knowledge into theoretical science and applied science, one might suppose that abnormal psychology were the concrete application of the data and laws furnished by general or systematic psychology. In actual fact this supposition is not borne out. So far from borrowing its material from the general psychology of sensations and perceptions, abnormal psychology and its derivative psychoanalysis have furnished a new approach to the problems of mental behavior. The trend of thought known as the "new psychology," even with its exaggerations and unsupported generalizations, may be put down to the credit of psychiatrists who were able to combine clinical knowledge and therapeutic skill with genuine philosophic insight.

Among this class of psychiatrists may be included Charcot and Janet in France, Freud in Austria, Morton Prince and Boris Sidis in America. Different as are their various theories on specific problems, these psychologists are yet at one in their refusal to reduce to the materialistic system of physiology. They affirm the specificity of psychological phenomena and the necessity of an explanation of such phenomena in terms of psychological conceptions rather than in terms of an unknowable structure of the cortex and body nerve tissue. The change in terminology is itself an indication of the revolution in thought: instead of speaking of the science of *neurology*—which is essentially a language pun built up around the popular metaphor of *nervousness*—we now use the terms psychiatry, psychoanalysis, psychological analysis. This is not to say that one attempts to explain phenomena in terms of new psychical or spiritistic entities, but rather in terms of the meanings which particular objective events have for particular individuals in particular circumstances. Just as when we seek to account for the effect the reading of a particular book had on a particular person, we find the objective facts about ink and paper of little importance and must attempt to envisage the subjective meanings aroused by the contents of the book; so psychologists have come to realize that it is of no purpose to study events as mere physical shocks on a physical system without taking into account the emotional contexts, the meanings that are more or less individual to the particular organism.

To describe this type of meanings, many psychologists and physicians have preferred to use the notion of function, and they thus speak of certain psychological troubles as functional neuroses. But whether this term is adopted or not, it has been found that there was only one method for studying the phenomena in question

and that was for the psychiatrist to familiarize himself, by patient questioning and clinical observation, with the inner history of the trouble. This leads us to another observation; namely, that knowledge and theories of this sort—dependent, as they are, very largely upon the artistic insights of the physician and psychiatrist—cannot have the same positivity as the observations of physical science. Freud himself recognized this fact when he wrote (in his *Introduction to Psychoanalysis*) that "it would be an error to suppose that a science is composed only of theses rigorously demonstrated, and it is a mistake to demand this." Janet said much the same thing when he pleaded for psychologists not to consider psychology as a science (in the sense that physicists use the term) but rather as a collection of monographs.

Doubtless because of the frailty of the subject matter, the theories of abnormal psychology, particularly those of psychoanalysis, were subject to grave misunderstandings. On the one hand, the worshippers of clear and precise ideas were scandalized at the fleeting nature of some of the intuitions. But on the other hand many advocates of the psychoanalytic doctrine more than made up for this by bringing rather too much precision into their science. They could do this only by constructing a metaphysics of the sex instinct and its symbolization. In this metaphysics complexes and symbols were treated sometimes as dynamic concepts (i.e. with fluid meaning), sometimes as static concepts on a par with those of the physical sciences. An ambiguity of this type is practically unavoidable, for such notions as symbol and complex carry this ambiguity in their philological meaning. We need only remember that the earliest philosophers to use the notion of symbolism, the Pythagoreans, slipped very naturally into the error of confounding the metaphorical act of symbolization with symbols as static entities representing other objects. Similarly the association psychologists confounded the dynamic act of association or growth of meaning with association viewed externally as a mechanical process, and therefore describable by laws. And inasmuch as the idea of complex is practically identical with association, it is readily seen how psychoanalysts fall into the same ambiguity.

For the purposes of discursive inferential reasoning, it is necessary to treat some of these concepts statically as if they were obeying the laws of mechanical causality. But when that is done, the results must be tested by empirical facts and not by means of the semiæsthetic, symbolic intuitions. Thus it is one thing for a commander of military troops to treat sex as a mechanical, almost material problem, on a par with food supplies and munitions. It is quite another thing for a psychoanalyst, tracing genetically the rise and fall of sentiments in a human individual, to discover what he calls transferences or sublimations of the sex instinct. In the first instance we are treating man as a machine with definite springs which behave in definite fixed ways, and sex is one of those springs. Such a conception is an abstract one, and scarcely fits the facts even in a limited situation. However, it is a precise conception and allows itself either to be verified or denied by empirical facts. In the second case, sex ceases to be a definite thing at all and becomes a sentiment—"an aspiration after happiness," to quote Rémy de Gourmont, "than which nothing is less definite." And the many gropings, the many expressions of the ultimate Libido, are not so much causes of one another as contingent temporal sequences. In order to show a relation of causality in the intellectual or scientific sense, it is necessary to have a limited situation in which an observed sequence, after being purified—so to speak—of its arbitrariness and subjectivity, has been experimentally confirmed.

Now the difficulty of the psychoanalytic technique is that it employs both of these schematisms. The psychoanalyst tries to be both a scientist, dealing not in advice but in observed correlations of fact, and a philosopher-confessor who assists his patient in the pursuit of happiness. Professor Janet in reporting to the French Academy of Medicine on the doctrines of Freud pointed out that psychoanalysis at times lays claim to an entire system of ethics. In a certain sense, it is true, neither the psychiatrist nor the physician escapes that responsibility: the analysis of human nature is too close to the aspirations of human nature to avoid involving the latter. But the scientific and ethical responsibilities must be distinguished and recognized for what they are.

The war cases of shell shock have disproved, in an objective way, the extreme Freudian thesis that sex disturbances (in the more specific sense) are the cause of neuroses. They revealed a rather new type of neurosis with preoccupations very different from those of civilian cases and reflecting quite definitely the war anxieties. They also served to disprove the mechanistic, physiological conception of the so-called functional nerve diseases.

With the destruction of the extreme Freudian thesis and the dogmatic physiological contention, no specific theory of neuroses has been left standing. In France—where psychological thought has never accepted either of these theses—an attempt was made by a brilliant writer, Dr. Albert Deschamps, to exploit the theory of fatigue as the raison d'être of the general type of neurasthenic diseases. Both the theory and the cure which it proposed harked back to the famous rest treatment of Weir Mitchell, which was very popular among psychiatrists a generation ago; but like so many other theories in abnormal psychology, the conception of fatigue and insufficiency of nervous energy was seen to be a valuable partial truth which permits the observer to understand the concrete nature of a particular class of cases but which is misleading when generalized into what amounts to a metaphysical conception.

The question may well be asked why such partial truths do not sooner or later find their place in a systematic classification, such as obtains in the natural sciences; why, for instance, there is not as complete a table of mental diseases with more or less empirical specifics as is the case in physiological therapeutics. The answer is to be found in the entire absence of a spatial form of representation, a circumstance which makes every mental concept, every mental theory, an elusive metaphor. In the domain of mind we come in contact with truths in a manner not very different from scents and odors. That is why the science of mind, necessarily different from the science of matter, comes in the long run to have no other criterion than the cultivated taste of the connoisseur.

We come back to the point we made at the beginning of this article. The real significance

of abnormal psychology as a theoretical study is for the light it sheds on the nature of normal psychological facts. An analogy comes to mind from social experience. Just as the political rebel, by challenging the ideology of an existing order, often makes the rest of the people realize the narrowness of the folkways, so the psychologically maladapted bring to light the limited horizons of ordinary mental behavior and even of the sciences of such behavior.

PSYCHOLOGY, EXPERIMENTAL. The progress of systematic experimental psychology during the decade 1914–24 was, as previously, largely confined to the tabulation and classification of sensations. A number of attempts were made to carry on the study of feeling and affection along experimental lines, but the results discovered remained isolated and were not integrated with the general body of natural knowledge. After the failure of Wundt's tridimensional theory of feeling, nobody attempted to construct a comprehensive empirical theory. The study of affective states was thus by force relegated to the theoreticians of psychoanalysis and abnormal psychology, who because they approached their subject less rigorously often got more concrete results. On the other hand the experimental study of perception—a much more feasible programme—was for a long time held up and thwarted on account of the systematic assumptions held by many psychologists. These assumptions were not challenged in the experimental realm until the rise of the configurational or *Gestalt* school of psychology in Germany. The dispute over the assumptions of the structural experimentalists and the German configurationists was still an open question in 1924; for that reason we are treating the subject of perception (q.v.) in a separate article

Vision. In the field of vision, Prof. L. T. Troland brought together, in a monograph published by the National Research Council (*Bull.*, vol. 5, no. 27, December, 1922), the available experimental data on the "Present Status of Visual Science." Passing lightly over the theories of color vision, he concentrated his attention on the psychophysics of vision. He reduced the introspective attributes of color to brilliance, saturation, and hue, the latter two being included in the term "chroma." Each of these attributes can be correlated with the wave length, intensity, and purity of the light stimulus. Troland also made a similar analysis of the perception of forms and of things in motion, first separating the introspective conditions from the physical and then proceeding to work out psychophysical relationships between them.

These relationships or functions he sought to divide up among the several stages of visual response. For instance, he assigned such effects as scotopic and photopic adaptation to the receptors, while other effects such as Carpentier's bands he attributed to the afferent conduction, with still others, like motion perception, belonging to the cortex. These relationships hold between the stimulus and the visual consciousness, but in some instances, according to Troland, "we are actually able to establish empirically the relationships between visual consciousness and stages in the response other than the stimulus." He went on to say that "this is particularly true with respect to the central process itself. The disturbances of vision which accompany lesions in the occipital lobe of the cerebrum demonstrate clearly the fact that the totality of the visual consciousness depends phychophysically upon the brain process; so that relations such as those studied in the majority of laboratory experiments, between consciousness and the stimulus, must be explained in terms of the physiological mechanism of the response, leading up to the focal region in the cortex, as well as by the direct psychophysical relation which exists between consciousness and the cortical activity in question."

Professor Troland's monograph contains a detailed bibliography of 268 titles, to which we refer the interested reader.

Audition. Professor Troland's systematization of visual science is paralleled by a treatise by Prof. R. M. Ogden on *Hearing* (1924). The volume treats every phase of the subject, from the controverted question of tonal attributes to the psychology of musical ability. *The Psychology of Sound* (1917), by Henry J. Watt, is another systematic treatise. As is usual with systematic treatises, the empirical facts are imbedded within a methodological viewpoint. In the case of Watt, he contributes the attribute of order, and it is upon this basis that he organizes a whole system of auditory space and volume. This attribute was objected to by other experimentalists

G. J. Rich, in a study of tonal attributes (*American Journal of Psychology*, vol. xxx) concluded, on the basis of numerical limens and the reports of his observers, that only three such attributes exist. These are pitch-brightness, volume, and tonality. Vocality he found to be a perceptive sign and not an attribute as maintained by Schole, Koehler, and others. Rich's concept of tonality resembled Kohler's *Tonhöhe* more than Revesz's *Qualität*.

Sir Thomas Wrightson, in his *Inquiry into the Analytical Mechanism of the Inner Ear* (1918), attacked the classic Helmholtz theory of hearing and proposed one of his own. He availed himself of the histological researches of Keith to propose a mechanical pressure-balance theory of hearing, in place of the German's conception of nerve fibres as resonators. Profs. E. B. Titchener and E. G. Boring (*American Journal of Psychology*, 1920, vol. xxxi) then proceeded to demolish the Wrightson theory, and showed that

while Helmholtz's theory was not sufficient to cover all the known facts, neither was any other theory proposed thus far.

Taste and Smell. The outstanding contribution of the decade was the revision of the classification of taste and smell qualities by H. Henning (*Zeitschrift für Psychologie*, vols. lxxiii, lxxiv). Experimental psychology had been content, in general, to accept Zwaardemaker's improvement on the old Linnæan classification of odorous qualities, and of the same investigator's results in the matter of olfactory mixtures and compensations. Henning, after trial of over 400 stimuli, proposed a new classification. There are, according to him, six fundamental qualities: fruity (lemon), putrid (H_2S), flowery (violet), resinous (frankincense), scorched (tar), and spicy (nutmeg). [The examples in parentheses are typical only.] The whole body of olfactory qualities, fundamental and intermediate, may be arranged on the surface of a triangular prism. At the six angles stand the pure fundamental odors, and along the edges, diagonals, and other cross lines of the surface lie the qualities which "resemble" two or more of the fundamental qualities. These intermediate qualities are all psychologically simple; their relation to the fundamentals is analogous to that of a tone to the limiting tones of the octave within which it is placed.

The basis of classification was introspective, although Henning undertook a correlation with chemical structure; likeness of intermolecular combination appeared to parallel likeness of olfactory quality. In the matter of mixture, Henning denied outright the analogy of odor and color; the olfactory experiences which result from dual stimulation, in his opinion, resemble rather the tonal fusions, for like the latter they evince degrees of fusion ranging from the "combinational odor" to less unitary forms. In general, any olfactory quality may fuse with any other; but the nature of the fusion depends upon the nearness or remoteness of its components in the olfactory series.

The treatment of taste on the part of Henning was no less radical. The German psychologist recognized the four fundamental qualities of sweet, sour, bitter, and salt, but insisted that they are connected by series of simple intermediate qualities, whose relation to the pure qualities is akin to that of the intermediate colors to the pure red, yellow, green, and blue of the color square. The whole system of taste qualities may be arranged on the boundary lines of a tetrahedron, with the pure fundamentals at the four angles. The mixture of gustatory stimuli gives fusions which in every case are readily analyzable.

Cutaneous Sensation. Head's theory of protopathic and epicritic sensibility was attacked from two quarters. H. Carr (*Psychological Review*, vol. xxiii) criticized the theory on grounds both of logic and of observation. E. G. Boring, repeating Head's experiment under improved conditions, reported his own observations of the return of cutaneous sensitivity after section of a sensory nerve (*Quarterly Journal of Experimental Psychology*, vol. x). He found that the results which Head's technique threw into high relief lost their special importance in the light of a more refined method, and that they took their place in a total body of fact which shows no such line of cleavage as that described by the British physiologist.

Boring himself outlined a theory of multiple innervation of the sensory "spots"; the nerve supply, he held, is so distributed that, under varying conditions, summation or inhibition of excitations may occur in varying degree. A hypothesis of this sort is, in Boring's opinion, adequate to the data of observation, and avoids the duplication of sensibilities which Head was led to assume.

Organic Sensations. E. G. Boring (*American Journal of Psychology*, vol. xxvi) reported experiments on the sensations aroused by the stimulation of the alimentary tract. He used thermal, mechanical, chemical, and electrical stimulation. In the esophagus, sensations corresponding to all stimuli except pepper and mustard were reported; in the stomach all were sensed, but it was not certain whether the sensations of cold, warmth, and electrical shock arose in the stomach or in the surrounding tissues. Hydrochloric acid was found to induce the sensation of hunger. The greatest error of localization occurred in the direction of the median line through throat and stomach, reference being often made to head, to throat, or to a point below the sternum.

Boring also made a qualitative study of experiences referred to the alimentary and urinary tracts (*Psychological Review*, vol. xxii). He concluded that under favorable conditions most of the experiences are introspectively reducible to various patterns of pressure and pain. Nausea was the most difficult experience to analyze. Experiments reported by A. J. Carlson (*The Control of Hunger in Health and Disease*, 1916) confirmed many of Boring's observations. Carlson, however, maintained that hunger is experimentally distinguishable from appetite; appetite, he held, may appear in the absence of hunger, and can be aroused by weak chemical stimuli which inhibit the hunger contractions.

PURDUE UNIVERSITY. A technological State institution founded in 1869 at Lafayette, Ind. The number of students rose from 2341 in 1914 to 3235 in 1924, the number of the faculty from 185 to 323 and the library increased from 40,000 to 60,000 volumes. The tax appropriations for the support of the university were correspondingly increased during the period from $479,251 to $1,415,000. A department of forestry was established, and the total number of courses offered in all departments was increased from 421 to 579. Advanced military training was introduced into the junior and senior years of all schools. Buildings costing more than $800,000 were built during the 10 years. These included the armory, costing $194,356, built in 1918; the home economics building built in 1923 at a cost of $151,414; Stanley Coulter Hall, for the biology department, built in 1917 at a cost of $101,440; a recitation building for the departments of education, history and economics and mathematics; a veterinary building; a horticultural greenhouse; a campus greenhouse; a locomotive museum; and buildings for the farm of the School of Agriculture. Winthrop Ellsworth Stone was succeeded as president by Edward C. Elliott.

PUTNAM, NINA WILCOX (MRS. ROBERT J. SANDERSON) (1888–). An American author, born in New Haven, Conn., and educated

privately. She began writing at the age of 11. Her books include *Esmeralda* (1918); *It Pays to Smile* (1920); *West Broadway* (1921); *Laughter Ltd.* (1922); *Say It with Bricks* (1923); and *Easy* (1924). She was a frequent contributor of short stories to the leading magazines.

QUEBEC. A Canadian Province with an area of 706,834 square miles, and a population of 2,361,199 in 1921, a gain of 17.7 per cent over the 2,005,776 of 1911. The rural population continued to fall off, in 1921 only 44 per cent of the total population living in rural districts as compared with 51.8 per cent in 1911. In 1921, males numbered 1,180,028 and females 1,181,171. By the 1911 census, 316,103 of the inhabitants were of British and 1,605,339 of French descent. There were 442,356 families in 1921 as compared with 307,304 in 1901. Populations of the largest cities in 1921 were: Montreal, 618,506 (490,504 in 1911); Quebec, the capital, 95,193 (78,710 in 1911); Hull, 24,117 (18,222 in 1911); Verdun, 25,001; Sherbrooke, 23,515; Three Rivers, 22,367.

Industry. Agriculture continued to thrive, averaging a total value of field crops of about $200,000,000. Low prices in 1923 accounted for the falling off in that year, the total being $133,137,400 ($99,279,000 in 1914). Hay and clover, oats, potatoes, buckwheat, barley, spring wheat continued to lead. Potatoes and turnips in particular showed increases. Fruit culture flourished, as did the maple sugar and syrup industry which averaged about $6,000,000 annually (1922, $4,187,630, as compared with $1,600,000 in 1913). In 1920, 33,000 acres were under tobacco, but the tillage fell off to 16,573 acres in 1922. The live-stock industry continued to expand, milch cows increasing from 761,816 to 968,705; other cattle from 693,540 to 813,046; sheep from 602,751 to 822,997; swine from 661,768 to 797,726. The wool clip in 1923 was 4,682,602 pounds and was second only to that of Ontario. Dairying, always an important industry, brought in $61,188,000 in 1923 in cheese, butter, and other products. Lumbering produced $19,656,462 worth of cuts of lumber in 1921. The manufacture of pulp and paper products led the Dominion. In 1922, $43,329,740 worth of wood was used in the manufacture of pulpwood while paper products totaled $108,676,952. In 1921 the fish catch had brought in $2,592,382; in 1921, $1,815,284; in 1913, $1,988,241. The mineral yields had only barely tapped the vast resources of the Province. In 1922, the total mineral production was $17,647,939, as compared with $11,836,929 in 1914. Asbestos ($5,552,723 in 1922), cement ($5,907,300), and limestone continued to lead. Discoveries of gold in northwestern Quebec drew prospectors to Malmartic and Fournière townships so that 3000 acres in claims had been staked out by 1922. The industrial development of the Province was marked, the census of 1921 showing 10,762 establishments, with a capital investment of $973,722,564 ($378,441,000 in 1913), and $784,753,805 the value of products produced ($406,167,950 in 1913). The number of employers was 10,762 and salaries and wages paid, $164,450,443. The distribution in 1921 of the value of manufactured products was. Montreal, $593,881,752; Quebec, $45,121,279; Hull, $16,623,648. The leading industries in order were: pulp and paper, wood, lath, etc., cottons, flour-mill products, leather, shoes, tobacco, butter and cheese, meat packing, clothing, shipbuilding, housebuilding, rolling mills. In every case the product was more than $20,000,000. The estimated water power of the Province totaled probably 6,915,244 horse power of which 1,073,883 horse power had already been developed, all by private capital. Work was under way on plants on the Montreal River and Lake St. John in 1923.

Trade and Communications. In 1922 there were 4977 miles of railway as compared with 4043 miles in 1914. Total imports for consumption in 1922–23 amounted to $222,478,422 ($187,301,493 in 1912–13); exports to $315,480,911 ($147,723,907 in 1912–13)

Government. Revenues for 1913–14 were $9,000,377; expenditures $8,624,368; by 1921–22 these had reached revenues of $21,609,396 and expenditures of $16,575,977. While the Dominion subsidy had remained the same over the period, larger revenues were derived from the succession and commercial corporation taxes. In June, 1922, the funded debt was $55,604,926 ($24,579,166 in 1914). For 1921, there were 5686 Roman Catholic elementary schools with 227,986 enrolled pupils; 697 model schools with 108,125 pupils; 378 academies with 110,202 pupils; 13 normal schools with 1215 pupils; in all (including all others), there were 6934 schools with 477,944 pupils. Besides, there were 799 Protestant schools of all grades with 70,307 pupils enrolled The total expenditure for all education in 1920–21 was $22,122,979 as compared with $9,225,771 in 1913. In the Dominion parliament representation remained the same; House of Commons, 65, Senate, 24. Of all the Canadian Provinces, Quebec remained the only one in which women were not enfranchised or permitted to stand for the Legislature of the Province.

QUEENSLAND. A state of the Commonwealth of Australia occupying the northeastern part of the continent. Area, 670,500 square miles; population, in 1911, 605,813; in 1922, 785,449; average annual increase, 2.52 per cent. Brisbane, the capital, including suburbs, had 209,699 inhabitants in 1921. Of the total area of the state, 94 per cent still remained unpreempted. Leading agricultural activities centred in the planting of maize, wheat, hay, and sugar cane. Pastoral pursuits continued to be important. The wool output in 1921 was 132,579,733 pounds (136,878,270 pounds in 1912–13). Sugar in particular showed increases,

the yield in 1921 being 2,287,400 tons of cane as against 1,135,126 tons in 1912–13. Total value of minerals in 1912, £4,175,355; in 1920, £3,462,214; in 1921, £1,456,436. Gold continued to decline, dropping from £1,128,868 in 1913 to £171,504 in 1921. Coal was the only mineral to show important gains in the decade. Imports for 1916–17 and 1921–22 were £6,263,102 and £8,639,446; exports for the same years were £14,542,270 and £17,573,103 Government accounts showed: revenues and expenditures for 1913, £6,378,213 and £6,372,097; the same for 1921–22 were £12,311,378 and £12,499,970. The debt mounted from £55,023,506 in 1914 to £88,005,001 in 1923 Here, as in New South Wales, the Labor party continued the most powerful group. In 1922, as a result of continuous agitation, a referendum decided for the abolition of the legislative council

QUICKSILVER PRODUCED IN THE UNITED STATES IN 1923

State	Mines producing	Ore treated	Quicksilver obtained: Percentage tenor won [a]	Quicksilver obtained: Flasks of 75 pounds	Value
California	9	(short tons)			
Texas, Nevada, Oregon, and Idaho	5	38,648	0.52	[b] 5,417	$357,759
	—	12,148	0 82	[c] 2,490	163,543
Total for 1923	14	50,796	0.59	7,937	521,302
Total for 1922	10	43,084	0.51	6,375	368,348

[a] Weighted means for 1923
[b] Includes 31 flasks obtained from cleanups, etc., and not considered in calculating percentage tenor
[c] Includes 179 flasks obtained from an unknown quantity of ore and not considered in calculating percentage tenor.

QUICKSILVER. The production of quicksilver was somewhat stimulated by the War, and in 1918 the world's output amounted to 3421.5 metric tons, but in 1921 it had declined to 2019 metric tons. In the latter year, Italy was the largest producer, its output amounting to 1071 metric tons, followed by Spain with 6354 metric tons, and the United States with 215.6 metric tons In the year 1922, the production of the United States increased slightly, being represented by a total of 6375 flasks of 75 pounds each, valued at $368,348 This was very little in advance of the 1921 production, 6339 flasks, the lowest annual output in the 72 years of recorded production of domestic quicksilver in the United States In this year a new duty of 25 cents a pound ($18.75 a flask) was a source of encouragement to the American quicksilver industry but with it came increasing difficulty in finding new ore and in securing competent labor

As will appear from the table, California produced 69 per cent of the 7937 flasks of quicksilver credited to the United States in 1923, and most of the remainder was produced in Texas. The increase in the output of the country over that in 1922 was the result of the resumption of production at the New Idria in California. Without this contribution the production in 1923 would have been lower than in 1922. During 1923, the United States exported 318 flasks of quicksilver and imported 18,073 flasks. There was an increase of nearly 14 per cent in the average price at San Francisco over the previous years and an increase of nearly 25 per cent in the production. The price of the metal declined from $70.70 in the first week of 1923 to $59.35 in the last week, and the average for the year was $65.68. Early in 1924 the price improved notably, and could it be maintained near or over $70 a flask, there would be increased production. Interest among producers of quicksilver was directed to the new mercury boilers designed by W L R Emmet. If this should prove as successful in practice as its sponsors believed, it would unquestionably produce an increased demand for quicksilver. Should this demand eventually develop, a large part of the quicksilver to satisfy it would have to be sought in foreign countries, for the deposits in the United States do not appear to be adequate to supply it. See BOILERS.

QUINIDIN. See HEART DISEASE.

QUINN, EDMUND T. (1868–). An American painter and sculptor born in Philadelphia. He was a pupil of the Pennsylvania Academy of Fine Arts and of Thomas Eakins, and in Paris of Injalbert He is an Associate of the National Academy and a member of the National Institute of Arts and Letters and is represented in America by a statue of Zoroaster, at the Brooklyn Institute of Arts and Sciences; a bust of Edgar Allan Poe in Poe Park, New York; a statue of Edwin Booth in the character of Hamlet at Gramercy Park, New York, and the World War Memorial at New Rochelle, N. Y. He has executed many portrait busts of prominent American men, and is a member of the council of the National Society of Sculptors.

R

RABAUD, HENRI (1873–). A French conductor and composer, born in Paris. He was trained under Massenet at the Paris Conservatoire and in 1894 won the Prix de Rome with a cantata, *Daphné*. In 1908–14 he was conductor at the Opéra Comique and in 1914–18 at the Grand Opéra. In 1915 he was also appointed conductor of the famous Concerts du Conservatoire. During the season of 1918–19 he conducted the Boston Symphony Orchestra and in 1920 succeeded Fauré as director of the Paris Conservatoire. His works comprise the operas, *La Fille de Roland* (Paris, 1904), *Le Premier Glaive* (Béziers, 1908), *Mârouf*, and *Savetier du Caire* (Paris, 1914; New York, 1917); two symphonies; a symphonic poem, *La Procession Nocturne; Divertissement sur des Chansons Russes; Eclogue;* an oratorio, *Job;* a Psalm for soli, chorus and orchestra; incidental music to *The Merchant of Venice, Antony and Cleopatra,* and St. Pierre's *Paul et Virginie; Hymne à la France Eternelle;* a string quartet, and other chamber music.

RACE PROBLEMS, UNITED STATES. The United States has faced internal race problems from the beginning. First, there were the Indian tribes to be displaced, controlled, and assimilated. In the main, this was a problem of conquest and subjection, and though once a serious matter, it has long ceased to trouble any one, except as a moral obligation of the nation to deal justly with the few Indians that survive (see INDIANS). Next in order came the Negro problem, resulting in the Civil War, through which the Negro came into the right to citizenship, but this raised anew social and political problems that are still acute Finally, the open door policy upon which the Government of the United States was founded as an asylum for the oppressed and dissatisfied of every color, creed, and nationality brought so many diverse racial elements to its shores that public sentiment began to demand restrictive measures, which ultimately culminated in an exclusion policy (see IMMIGRATION). Both the Negro and the immigration question are very complex, but one of the factors always recognized is that of race, or the biological problem. The apparent rapid increase of mulattoes, for example, threatens to end in complete hybridization of both white and Negro stocks. Naturally, this raises the question as to the desirability of such amalgamation and the quality of the resulting hybrids. Again, in the early decades of the nation's history, immigration was chiefly from the countries of northern Europe where the people were very much alike; but later, Asiatic peoples threatened to fill up the western States, and still later, the populations of southern Europe began to migrate to the Atlantic States in large numbers. As to Asiatics, the race question was promptly raised and a policy of exclusion adopted. Finally, the growing volume of immigration from eastern and southern Europe raised questions of policy leading to an Act of Congress in 1907 creating an Immigration Commission.

While the chief factors considered by this commission were economic, they did provide for a study of the racial elements in immigration. This research was directed by Prof. Franz Boas of Columbia University, and the results were published in 1910. The immediate objective of the inquiry was to discover what biological changes, if any, took place in the successive descendants of foreign stocks. The stocks selected for study were Bohemians, Slovaks, Poles, Hungarians, Jews, Sicilians, and Neapolitans, and the results, it was claimed, showed that certain marked changes were going on in head form, facial dimensions, and stature. In other words, the new environment in which the children of immigrants grew up seemed to have brought about definite modifications in facial characters. These changes were minute, but they were heralded as proving that racial types were not stable and that the new environment of America tended to level down differences. The investigation was too limited in scope to warrant such a sweeping conclusion, and it was not followed up. Its chief value, then, is in pointing out the scientific approach to the biological problems in immigration. The publication of this study provoked a great deal of discussion, and it was closely followed by several forceful statements of the racial problems involved in the immigration question; e.g. Madison Grant's book, *The Passing of the Great Race.* Mr. Grant's thesis was that the peoples of northern Europe, grouped under the name Nordic, are responsible for the modern civilization of western Europe and America, that their peculiar racial abilities are the basic causes in the evolution of this type of civilization, and that with the development of this civilization come abundant contacts with other racial stocks, resulting in mixture of blood and the gradual disappearance of the old Nordic stock.

The War put the supreme test to the naturalized citizen and his children. The situation so created awakened a sense of insecurity in the face of large blocks of ill-assimilated aliens and shocked the country into a sober contemplation of the political and social dangers involved. Further, the universal draft brought into the army, the navy, and other branches of the service, representatives of all the racial groups in the country, so that they were thrown into competition with each other. For some years previous to the War, the special students of psychology and education had been actively developing methods of rating the abilities of individuals. Naturally these methods were used in the classification of the army personnel, and it was inevitable that in comparing the ratings given, account should be taken of racial differences. These were fully set forth in a bulky

report on *Psychological Examining in the United States Army*, edited by Robert M. Yerkes. Later, the racial differences in soldiers' ratings were critically presented by Carl C. Brigham in *A Study of American Intelligence*. Marked differences in rating were found for the several racial elements in the army. The question of relative racial merits was thus raised, and also the danger of lowering the national intelligence average by unrestricted immigration from stocks with a low rating was apprehended The publication of the army test results provoked heated discussion, and this in turn stimulated research by psychologists and educators. Careful studies were started in the schools of the country, where the results could be fully checked. Fundamental inquiries were also being made as to the objective criteria of superior ability, which would in the end give more precise methods for distinguishing between the native ability of the individual and what he has acquired by education.

From the army tests it was observed that the relative average ratings for men of English, Dutch, Scotch, German, and Danish descent was above the United States national average for the native-born white. The full series in order from the highest to the lowest in rating was as follows: England, Holland, Scotland, Germany, Denmark, native-born white, Canada, Sweden, army average for all white soldiers, Norway, Belgium, Ireland, Austria, Turkey, Greece, foreign-born white, Russia, Italy, Poland, and Negroes. This rating indicated that the immigrants from countries in northern Europe were better qualified to perform the duties of soldiers than were those from southern Europe. In these results an attempt was made to eliminate the learning and language factor, as by comparing the ratings for those of little schooling with those from the same racial stock with more than the average school experience, etc. The critics of these studies have, however, emphasized the specific character of the army tests and raised the more general question as to whether abilities shown in them are desirable in times of peace. On the other hand, the psychologists have been able to make a good case in their claim that to a large degree native ability is measured, but they are now actively engaged in further researches on this problem.

Of the studies completed in the United States since the War, mention may be made of those of Indian children by Professor Hunter of the University of Kansas, which show not only that Indians rank below white children, but that the mixed-blood children take intermediate positions according to the degree of mixture. In a similar way, by the use of psychological tests, Sullivan and Paschal of the University of Arizona have shown that among so-called Mexican children in the public schools of the border States the rating increases with the lightness of skin color. These are, however, but samples of the great volume of data which in 1924 was being accumulated in the educational institutions of the country, where the use of psychological and educational tests had become all but universal. Since all the racial elements in the population are represented in the schools, educators and psychologists were expected soon to have in their hands a basis for estimating the relative qualities of mental ability in each. On the psychological side of the race problem, 1914–24 has been a decade of progress, probably the forerunner of a great advance in knowledge and consequently of the formulation of new national policies.

The race problem has other such aspects as psychopathic tendencies, immunities to disease, longevity, fecundity, etc., as well as all forms of social delinquency Modern conditions doom the able and competent to support the sick, the inefficient, the criminal and defective; hence, it is inevitable that stock should be taken of the different racial immigrant groups with respect to these characteristics. Insurance companies had begun to segregate their vital statistics according to race, and this reveals positive differences in the expectation of life. An investigation by Dublin showed a higher rate of mortality for the foreign-born of New York as a whole and higher than for the same stocks at home. When the races are treated separately, however, the Russian Jews equal the native-born; the descending order is Russian Jews, Italians, English, Scotch, Welsh, Germans, and Irish. These varying death rates are probably indicative of different degrees of resistance to the strain of readjustment to American life, and so are an index of racial values in immigrants.

Further, the United States Congress authorized an inquiry as to the relative number of defectives in public institutions, a report on which was made by Dr. H. H. Laughlin. According to this report, a much greater proportion of the foreign-born are found in public institutions for feeble-mindedness, insanity, epilepsy, blindness, deafness, etc., than of the native-born, and again the ratio for immigrants from southern Europe is much higher than for those of northern Europe. While this is a pioneer study and the results cannot be taken as final, yet like all the preceding investigations, it makes clear the force of the race factor, and the need of extensive research for guidance in the development of a sound policy with respect to immigration and internal affairs.

Further, the need of anthropometric studies among the population of the nation, region by region, has become apparent. Not only did the publication of measurement data by the Surgeon-General of the United States Army reveal the importance of such studies, but the manufacturers of ready-made clothing, engaged in quantity production, are finding it increasingly difficult to gauge accurately the proportionate number of suits for each standard size. A faulty estimate in this will entail losses of great magnitude. Clothing manufacturers are in the same predicament as a life insurance company would be without vital statistics, for without adequate data on the regional differences in bodily size and proportion, they can only proceed blindly. And the uncertain element is race, since immigration has been changing the population content from decade to decade and hybridization has been introducing new ratios of bodily proportions. It is, therefore, becoming clearer that a study of bodily size and vigor on a national scale is needed for economic as well as for social reasons

Even during the late War the United States military authorities experienced great difficulties in supplying in advance the proper sizes of clothing for the enlisted men. Accordingly, a series of measurements were made at demobilization for the establishment of sizes and frequencies. In these measurements the ancestry

of soldiers was taken, thus giving some comparative data as to race, from which it appears that significant differences in size and proportion hold for the several race groups. As a sample of these differences in size and proportion the following ranks may be noted:

Stature	Weight	Chest Circumference	Waist Circumference
Scotch	German	Polish	German
English	Polish	German	Polish
German	English	Italian	Irish
Irish	Scotch	Irish	Scotch
Polish	Irish	Scotch	French
French	French	French	Italian
Hebrew	Italian	English	Hebrew
Italian	Hebrew	Hebrew	English

The greatest average measurement is at the top of each column; thus, while the Scotch and English are tallest, they are quite far down the line in waist circumference, especially the English. Likewise the measurements for the native-born show that the mountaineers of Carolina, Kentucky, and Missouri, who are largely of Scotch and English stock, are very tall, but slender in body. The Poles, Italians, etc. making up the bulk of recent immigration are relatively large in chest. It is clear that the physique of the nation is undergoing regional changes and that its bodily future presents military as well as industrial problems. However, the study of populations is now generally recognized as a special field for research, upon which a volume has been issued by A. Carr-Saunders, entitled *The Population Problem*. In general, however, it is clear that race problems in the United States are little short of world problems and that under modern conditions they are the most fundamental of population problems See ANTHROPOLOGY; ETHNOGRAPHY; MENTAL MEASUREMENT.

RACES, ORIGIN OF. See ANTHROPOLOGY.

RACES OF MAN. See ANTHROPOLOGY.

RACIAL MINORITIES TREATIES. The protection of racial, linguistic, and religious minorities constituted one of the most difficult problems dealt with at the Peace Conference of Paris. Throughout the world there was a tremendous agitation for national self-determination. The peace-makers of 1919–20 endeavored to enshrine the principle of nationality in the political and territorial resettlement of Europe, and to a large extent they succeeded (see PEACE CONFERENCE AND TREATIES); but so intermingled were different nationalities in various parts of the former empires of Russia, Austria-Hungary, and Turkey that it proved virtually impossible to draw frontiers for Poland, Czecho-Slovakia, Rumania, Serbia, Greece, etc., which would satisfy the legitimate ambitions of their own peoples and yet not outrage their neighbors. Ethnographic considerations had to be weighed, along with economic and strategic necessities and desires. A racio-religious problem like that of the Jews who were suffering persecution even during 1919 in various countries of Europe, particularly Poland, served to complicate the situation. The Jews were indeed promised a national homeland in Palestine, but even there they were in a minority. Meanwhile, what was to become of their kinsmen in Europe? These problems could not be solved by splitting up the world indefinitely. Not every tiny group could have its own flag and place in the family of nations. The formula of self-determination, carried to an extreme, would have been a reductio ad absurdum. On the other hand the world had been so long and so sorely troubled by such repressive movements as the Anglicization of Ireland, the Russification of Poland, Finland, etc., that it would have been utter folly to hand over dissentient minorities to the tender mercies of nationalist patriots who despite their own thirst for national political independence and national cultural expression would tyrannize over "inferior races." Experience had amply demonstrated that newly emancipated or unified nations were the first to deny emancipation or unification to others.

The Great Powers which dominated the Peace Conference did not intend to have their sovereignty impaired by pledges regarding the equitable treatment of minorities within their own boundaries, but neither were they entirely willing to underwrite a settlement affecting other states in which the oppression of submerged nationalities should constitute too great a menace. They argued that as it was their efforts that had largely won the War, it was their duty and privilege to dictate the peace, and as they were consenting to the resurrection or augmentation of Poland, Rumania, Czecho-Slovakia, Jugo-Slavia, etc., and were transferring large numbers of people of different races, languages, and religions from those of the majority, they had the right and were in duty bound to see that states which they were so conspicuously aiding should not be in a position by unjust or tyrannical treatment of such minorities to imperil the peace of the world. During the stormy eighth plenary session on May 31, 1919, President Wilson took the lead in defending the attitude of the Great Powers, much to the dismay and discontent of the smaller powers. Rumania and Jugo-Slavia hotly resisted the exaction of such pledges as were contemplated and even refused for several months to sign the Treaty of St Germain, but eventually (December, 1919) they were partly coerced, partly conciliated, into signing. (See PEACE CONFERENCE AND TREATIES.) During 1919 and 1920 the Great Powers negotiated a series of treaties with the Balkan powers and succession states which elicited pledges to respect and preserve political, religious, cultural, and economic rights of dissentient groups.

In the case of Poland (treaty signed June 28, 1919), special protection was deemed necessary for the Jews, who constituted one-seventh of the population. The new Poland came to include also some 2,000,000 Germans and 3,000,000 Ruthenians, in the province of Galicia, who were to be similarly protected. In the case of Czecho-Slovakia, there were some 3,000,000 Germans, 750,000 Magyars, and 460,000 Ruthenians, not to mention the religious minorities comprising some 1,000,000 Protestants, 500,000 Greek Catholics, and 350,000 Jews. In the case of Rumania there were several million Magyars, Germans, Serbs, etc., and a large element of Jews (750,000). In Jugo-Slavia special provisions were made for the Moslems. In addition there were incorporated in this new state some 450,000 Germans, 450,000 Magyars, 150,000 Rumanians, and some Bulgarians. Italy, which acquired not only the Italian-speaking population of irredentist Trentino and Trieste but also some 300,000 Austro-Germans in the Tirol and a like number of Jugo-Slavs near the Adriatic, was not obliged to make any

pledges. Greece, however, being a small power, was forced to promise special treatment for minorities in Macedonia, Thrace, etc. Clauses protecting minorities were inserted in the treaties with Austria, Bulgaria, Hungary, and Turkey; and subsequently Germany, as a result of the Upper Silesian settlement, was compelled to subscribe to the principal parts of the Polish Minorities Treaty for at least 15 years as regards those parts of Upper Silesia definitely awarded to her.

The minorities treaties were alike in all essentials, differing only from state to state as special provisions were made to meet exceptional circumstances. In general they removed all restrictions on the use of languages, on the exercise of any religion not injurious to public welfare, and on the press and right of free speech, free assemblage, and free association, etc All languages were to be given adequate facilities before the courts. All racial, linguistic, and religious minorities were to have the right to establish, manage, and control, at their own expense, charitable, religious, and social institutions and schools. The national government, i.e. the dominant majority in the state, might make instruction in its official language obligatory in all schools, only providing it offered adequate and reasonable facilities for other languages used by the people within its frontiers.

These stipulations were primarily guaranteed by the Great Powers, but they were also declared "objects of international concern over which the League of Nations has jurisdiction." Any member of the Council was empowered to call attention to infractions of a minority treaty, and disputes as to law and fact might in certain instances be referred to the Permanent Court of International Justice for final decision. When it came into existence, the League of Nations assumed control. It was early decided that under ordinary circumstances, when the Secretariat received a petition from a minority, it was to communicate it to the government concerned before passing it on to the Council, in order to allow the government to examine the charges and to state its position. The whole matter was then to be studied by a Council committee, and if action were deemed necessary, the Council was authorized to take suitable measures for the observance of treaty obligations. Czecho-Slovakia very soon won an honorable renown by the readiness with which she gave all necessary information to the League regarding her treatment of minorities and her whole-hearted fulfillment of treaty pledges. But the attitude of Poland and Rumania did not prove to be so coöperative.

In addition to watching over the observance of Minorities Treaties signed at the Peace Conference, the League obtained declarations from various Powers, on their admission into the League, with regard to the protection of minorities. On Sept. 22, 1921, Albania signed a declaration promising besides other things to provide "an electoral system giving due consideration to the rights of racial, religious, and linguistic minorities," to give full detailed information, and to "take into account any advice it might receive from the League of Nations with regard to the question." Similar declarations were obtained in 1921 from Lithuania and in 1922 from Esthonia and Latvia. In the case of Finland, the Council resolved (Oct. 2, 1921) that under existing internal laws, minorities were protected, and a declaration was needless The Great Powers made no pledges regarding themselves, but the Third Assembly of the League (1922) formally "expressed the hope that states not bound to the League by any legal obligations, such as that contained in the Minorities Treaties, would nevertheless observe in their relations with racial, religious, or linguistic minorities, at least the same degree of justice and tolerance as is required by the treaties watched over by the Council."

The protection of minorities was certainly not completely achieved, but a long step forward was taken in providing international machinery to achieve that end. Some thinkers objected to the Minorities Treaties as a potential source of great trouble. Says one writer:

"Equality of treatment to the degree specified in the treaties places restrictions upon the action of a people in making laws or modifying their constitution that may prove unendurable. Such restrictions are really a limitation of national sovereignty respecting internal affairs. They are justifiable only if the League of Nations will see that the minorities do not become a privileged class and do not carry on ceaseless and unjustifiable agitation. In the United States there is solidarity, in part through a common language. In Central Europe the languages of the minorities are retained, and the state is compelled to countenance and even to develop them. Linguistic differences will be perpetuated and even increased. Irredentism will continue. Many of the wisest men of Europe and America deprecate these treaties; they regard them as a standing invitation to quarrel.

"The extraordinary hatred of one people for another through Central Europe will be lessened only if the processes of migration (and assimilation) are added to strong economic revival Hatreds are difficult to maintain in the face of profitable trade. Unless tendencies mitigating hatred are cultivated, the Minorities Treaties will be worthless; if natural tendencies toward friendship can be created, the Minorities Treaties will become obsolete."

RADCLIFFE COLLEGE. A college for women at Cambridge, Mass., founded in 1879. Instruction is given by members of the Harvard faculty. Most of the courses of study are identical with courses of study offered in Harvard, and all the courses are of the same grade as those given at Harvard. The enrollment in 1914 and in 1921 was exactly the same, 628 students, and in the years between approximated that figure, but in 1922 the number jumped to 728, and in 1923 to 852. The total number of graduate students enrolled on Nov. 1, 1923, was 212. The faculty was increased during the decade from 136 to 148 members, and the library from 32,000 to 50,000 volumes. Due largely to an endowment campaign held in 1921 the productive endowment of the college was increased from approximately $1,000,000 in 1914 to $3,000,000 in 1923–24. Briggs Hall, a new dormitory, equipped to house 72 students, was under construction in 1923. In September, 1923, Ada Louise Comstock, LL.D., Litt.D., L.H.D., succeeded Le Baron Russell Briggs, LL.D., Litt.D., as president.

RADIO TELEGRAPHY. The introduction of continuous or sustained waves instead of the damped waves of the former spark sets marked a very important change in radio telegraphy and gave birth to radio telephony (q.v.). Although continuous waves were produced for

radio by machine generators many years ago, it was not until the Poulsen Arc came into vogue that the continuous waves (C.W.) were much used in practice. This method was soon superseded by the Alexanderson high frequency generator, which in turn was being superseded by the oscillating vacuum tube set.

The improvements in vacuum tubes (three-electrode thermionic tube) in the 10 years since 1914 were notable. The introduction of the thoriated filament enormously increased the electron emission and made possible tubes of higher efficiency and greater capacity. With the thorium-impregnated filament the power required for the filament was reduced to about one-quarter that used previously and a small tube was made requiring only 0 18 watt in the filament, while for the convenience of the amateur a tube was developed the filament of which can be supplied by one standard size dry battery (1 volt and 0.25 amperes). A tube capable of dissipating 250 watts in its plate circuit is now a standard and tubes have been built for an output of 20 kilowatts using 12,000 to 15,000 volts on the plate. In this tube the anode (plate) is the container and water cooling is employed In commercial practice a life of 4000 hours is expected of tubes and it is stated that it is possible to get 100 kilowatts in the antenna with a bank of tubes, while a 4 kilowatt in the antenna was standard practice in radio telegraphy (Marconi)

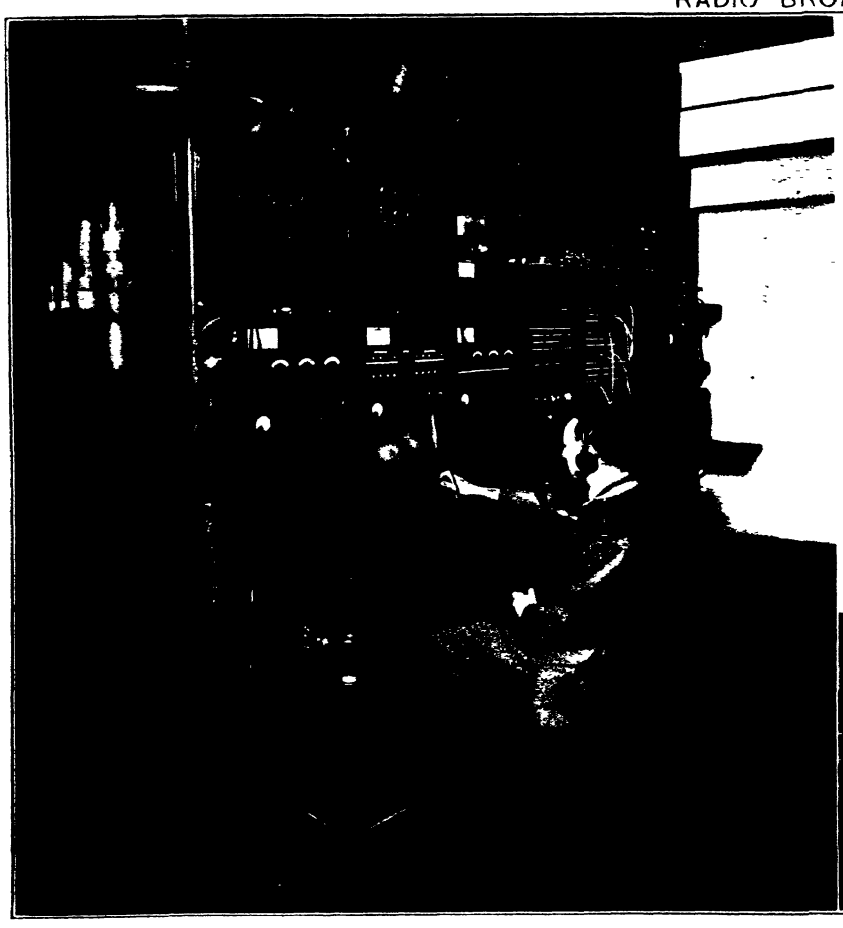
The organization of the Radio Corporation of America in 1919 brought together several operating and manufacturing companies controlling interdependent patents and put at the disposal of one organization most of the important United States patents relating to radio in general and to tubes in particular.

In radio telegraphy the construction of continuous wave generators of the Alexanderson type in sizes of 200 kilowatts with incidental speed, frequency and voltage controlling devices marked an important step forward in transoceanic communication. Marconi stated that sending apparatus and antennæ had been improved to the point where 35 per cent of the plate output and 50 per cent of the antenna input were radiated into the ether The use of machine senders employing prepared tape increased the regularity, accuracy and speed of sending, while the automatic receiver using a beam of light playing on a sensitized photographic tape made it possible to receive at the rate of 100 words per minute under exceptional conditions and at 50 words per minute under normal conditions. The speed of transmission in 1924 was from 10 to 12 times that accomplished in 1912.

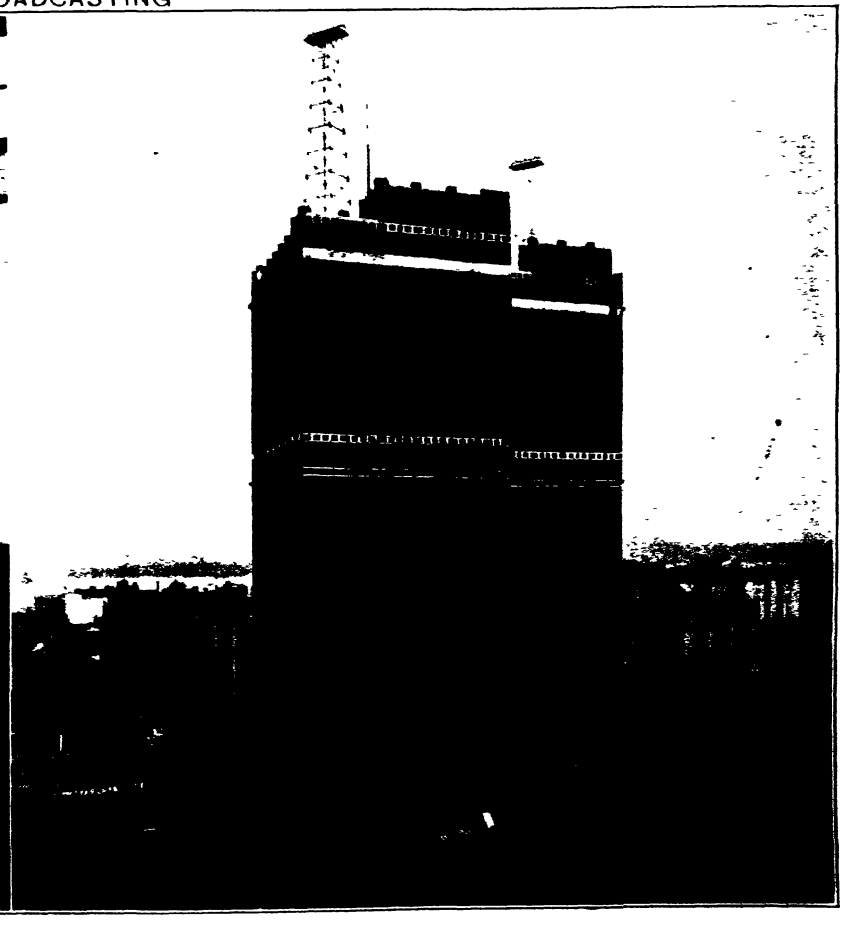
The Heterodyne or beat-note receiver with amplification by tubes increased the sensitiveness of the receiver The directive antenna further increased the selectivity, while the combination of two or more such antennæ with a device called the "barrage receiver" which combines two circuits so that an interfering signal from a near-by sending station is neutralized out, while the desired signal is amplified, made possible duplex radio. This is the simultaneous sending and receiving of messages between two given stations. Thus a sending station located at New Brunswick, N. J., and its receiving station at Belmar (later at Riverhead, L. I.) could work simultaneously.

The "wave antenna" came a little later. This is a very long straight horizontal antenna having a length approximately that of one wave (15,000 meters). It is pointed in the direction from which a desired signal comes and the end at which the signal arrives is grounded by a suitable resistance to prevent wave reflections. Static coming from any other direction than that of the signal is practically eliminated as the antenna is not sensitive to waves coming crosswise and any undesirable effects coming in a direction opposite to that of the signal dissipate themselves in the resistance.

In 1921, the Radio Corporation put into operation its radio central at Rocky Point, L. I., for general transoceanic service. This had a large transmitting antenna and nearby, at Riverhead, one receiving antenna. The transmitting antenna consisted of 12 wires, 7500 feet long, operating at 135,000 volts, which was supplied by 200-kilowatt generators. It could send two messages simultaneously at wave lengths of 16,465 and 17,500 meters. The receiving antenna consisted of two wires, 9 miles long (15,000 meters) and was of the wave and directive type. On it six messages from different parts of Europe could be received at the same time at reasonably different wave lengths (2 per cent). Both the sending and receiving of messages was controlled from the main station in New York City and no manual relaying was required. The speed of transmission was from 40 to 100 words per minute.



In 1922, regular radio telegraph service was established between San Francisco and Hawaii and Japan by means of a sending and a separate receiving station in the neighborhood of San Francisco with the control in the main office in San Francisco.



Recent experience has shown that radio waves are refracted and deflected by layers of the atmosphere of differing densities and character Thus it had been found that after crossing the ocean the waves arrive from a direction at quite an angle with the true direction between sending and receiving stations and that this deflection changes from hour to hour.

During the War, radio communication between airplanes, both by telegraphy and telephony, was developed to a practical success and received a further practical demonstration on the occasion of the flight of the United States Navy airplane *NC4* across the Atlantic, as it was almost continuously in communication with radio stations.

Radio Compass. The directive receiver, based on the invention of Bellini-Tosi, made possible the "radio compass" which is in regular service on both the Atlantic and Pacific coasts. Two such stations are located some miles apart on the coast. As a ship at sea sends out radio signals, the operator at each station manipulates its directive antenna until the intensity of the received signals indicates the bearing of the ship from that station. From the readings of the two stations and their distance apart the exact location of the ship may be found by triangulation. This information is then sent to the ship.

Bibliography. Many works on radio communication have been published and appear from time to time. Those that can be recommended include: Lauer and Brown, *Radio Engineering Principles* (New York, 1920); Morecroft, *Principles of Radio Communication* (New York, 1920); Signal Corps, United States

RADIO TELEPHONY. Radio telephony came into very general use during the War, particularly for military purposes over short distances. Before that it had been in an experimental stage. The first demonstration of long-distance telephony was the sending of a voice message from Arlington, near Washington, D. C., to Honolulu and to Paris on Oct. 23, 1915. Vacuum tubes were used to supply the power for this experiment and it was considered a great accomplishment that the message was intelligible and the voice recognizable. In 1919, a telephone message was sent from Washington to New Brunswick, N. J. and from there sent by radio to President Wilson on board the U.S.S. *George Washington* on the Atlantic. On Jan 14, 1923, conversation was maintained for some hours between Arlington and London, England. This was accomplished by a scheme of eliminating the carrier wave after it had been modulated, and transmitting only the frequencies known as the side-band, thus reducing the power required and the range of frequency used. This proved that trans-Atlantic telephony was entirely practicable and only awaited economic justification. Since then the programmes of American broadcasting stations have been frequently heard in England

In 1920, regular radio telephone communication was established between the cities on the Pacific coast of the North American continent and Avalon on Catalina Island by interlinking the telephone system of the mainland with that on the island by means of radio telephony. It is possible to get connection from a private station on the mainland to one on the island in the same manner as any long-distance call is obtained.

Broadcasting. Broadcasting by radio by 1924 had become not only a national pastime in the United States but almost a necessity and an essential part of American economic, political, and social life The growth of broadcasting stations was so rapid that in 1924 there were several hundred in the United States and it became necessary for the Department of Commerce systematically to license them and allot wave lengths and time schedules in order to prevent annoying confusion. From the beginning these stations used vacuum tubes as their source of power. A few were permitted to use 1000 watts in the antenna, but the majority employed 250 or less. There had been a continuous improvement in the technique of their operation and this had extended their range almost as much as the increase in power used. By a natural and healthy growth the standards of technical operation and the quality of the material in their programmes improved greatly so that they justified themselves as national educators

Important market, agricultural and financial news was sent out, as well as sporting news, university lectures, church services and music of all classes including the highest. This service was free to any possessor of a receiving set, and might be considered a very striking economic phenomenon and differentiating the United States from almost all other countries. In many of the latter the owner of a receiving set was forced to pay a tax, license fee or rental for the privilege, and in some countries he was limited to receive from only one broadcasting station.

The radio repeating station was a new technical development introduced in 1923. By this means one large important broadcasting station, which is so located that it can obtain the best talent for its programmes, broadcasts to its immediate neighborhood at some wave length from 250 to 600 meters, and in addition sends out the same programme on the wave length of about 100 meters, which will not interfere with any broadcasting. This 100-meter wave picked up by various subordinate stations, hundreds of miles away, is converted to a standard broadcasting wave length, amplified and sent out to its immediate neighborhood. This gives the people in an out-of-the-way part of the country the same programme as those in the large cities without the necessity of buying elaborate receiving sets and with less interference than if received directly.

After 1919 there was a wonderful development in the production of simple and efficient receiving sets as well as elaborate and sensitive sets. By 1924 it was possible to obtain a simple set at reasonable cost which would receive very well with a good antenna the programme of the local broadcasting station, while for receiving from a great distance sets were available which while fairly complicated in their construction, were very simple to operate. For the city dweller in an apartment who could not have an outdoor antenna the coil or "loop" antenna served as a substitute. This is a flat coil of 20 to 30 turns in the form of a square of about 30 inches on a side. It receives very well if three or four stages of amplifications are used and may be used inside a building. It is quite sensitive to direction and must be turned with its plane in the line of the signals.

The Neutrodyne was the trade name of a popular set usually consisting of five tubes, two radio frequency amplifiers, a detecter and two audio frequency amplifiers, with a special condenser connected between the grid of each of the radio frequency amplifiers and a middle point of the secondary of the transformer to the next step The object of this connection is to stabilize the operation by neutralizing the effect of the capacity between the grid and plate and their leads

The reflex is a general name given to a popular type of circuit in which a crystal is used as a rectifier or detecter and tubes are used both for radio and audio frequency amplification. By an ingenious arrangement of circuits, one tube may be used twice, once for radio frequency amplification and once for audio frequency amplification. The claim that the crystal gives a better quality of reproduction appeared to be justified.

Superheterodyne. The Superheterodyne of Armstrong was a combination of circuits for receiving radio messages which received much publicity. It is based on the beat-note principle and gives very strong signals from a loop or coil. The incoming signal is tuned in the loop circuit and then impressed upon an oscillating tube circuit which is tuned to give a beat note of a definite frequency with the incoming signal. This beat note is sent through two or three amplifying tubes and circuits which are very accurately tuned to the definite beat note, which is the same for all signals. This amplified beat note is then rectified (detected) and amplified

This is a flat coil of 20 to 30 turns in the form of a square of about 30 inches on a side. It receives very well if three or four stages of amplifications are used and may be used inside a building. It is quite sensitive to direction and must be turned with its plane in the line of the signals.

The Neutrodyne was the trade name of a popular set usually consisting of five tubes, two radio frequency amplifiers, a detecter and two audio frequency amplifiers, with a special condenser connected between the grid of each of the radio frequency amplifiers and a middle point of the secondary of the transformer to the next step The object of this connection is to stabilize the operation by neutralizing the effect of the capacity between the grid and plate and their leads

The reflex is a general name given to a popular type of circuit in which a crystal is used as a rectifier or detecter and tubes are used both for radio and audio frequency amplification. By an ingenious arrangement of circuits, one tube may be used twice, once for radio frequency amplification and once for audio frequency amplification. The claim that the crystal gives a better quality of reproduction appeared to be justified.

Superheterodyne. The Superheterodyne of Armstrong was a combination of circuits for receiving radio messages which received much publicity. It is based on the beat-note principle and gives very strong signals from a loop or coil. The incoming signal is tuned in the loop circuit and then impressed upon an oscillating tube circuit which is tuned to give a beat note of a definite frequency with the incoming signal. This beat note is sent through two or three amplifying tubes and circuits which are very accurately tuned to the definite beat note, which is the same for all signals. This amplified beat note is then rectified (detected) and amplified

again by audio amplification if desired. The set contains as many as eight tubes and requires very careful tuning of the beat note circuits. The principal advantage is that there is no radio frequency amplification with its attendant instability, but the amplification is done at a much lower frequency (usually 50,000 to 100,000 cycles).

Radio to Moving Trains. It was found entirely practicable to receive radio signals, either telegraphic or telephonic, on a moving train either from near-by stations of the railroad company or from the general broadcasting stations. The original intention of this was to transmit instructions to the train crews while traveling between stations, but its most general use was to furnish entertainment for the passengers. See RADIO TELEGRAPHY and consult for reference works mentioned there under *Bibliography*.

RADITCH, STEPHEN. See JUGO-SLAVIA, *History*.

RADIUM AND RADIUM MINERALS. Radium is a metal with a white metallic lustre. It has been isolated only once or twice, and few persons have seen it. It is ordinarily obtained from its ores in the form of sulphate, chloride, or bromide, and is usually sold and used in the form of these salts. These are all white or nearly white substances. Radium, radium salts, and radium minerals are not generally luminescent. Tubes containing radium salts glow mostly because they include impurities which the radiations from the radium cause to give light. Radium is found in nature in such exceedingly small quantities that it is never visible even when the material is examined with a microscope. Radium ore ordinarily carries only a small fraction of a grain of radium to the ton; radium will never be found in large masses, because it is formed by the decay of uranium, a process that is wonderfully slow; and radium itself decays and changes to other elements so rapidly that it does not accumulate naturally in visible masses.

Original radium minerals, such as uraninite, samarskite, and brannerite, are black and have a shiny fracture and a high specific gravity. They are rarely found in commercially valuable quantities. Pitchblende, which has the same composition as uraninite and the same general appearance except that it shows no crystal form, occurs in veins. It has been found in a few places only—in Bohemia, southern Saxony, Cornwall, and Gilpin County, Colorado. When these minerals break down through weathering, other radium minerals are formed from them, such as autunite, torbernite, carnotite, and tyuyamunite. Carnotite and tyuyamunite are the most abundant of these minerals and in 1924 were furnishing the bulk of the world's radium. Both are bright canary yellow in color and are powdery, finely crystalline, or, rarely, claylike in texture Carnotite is a hydrous potassium-uranium vanadate. Tyuyamunite is similar in composition but contains lime instead of potash. The greatest known deposits of these two minerals are in southwestern Colorado and southeastern Utah, where both are associated with fossil wood and other vegetation in friable, porous, fine-grained sandstone. Small quantities of carnotite have been produced near Olary, South Australia. The only other deposits that yield tyuyamunite in notable quantity are those of Tyuya-Muyun, in the Andidjan district, Ferghana government, central Asiatic Russia (Russian Turkestan), where tyuyamunite occurs with rich copper ores in a pipe in limestone (see below).

Radium Industry. An important radium industry was started in the United States during the War, utilizing the carnotite deposits in Utah. This, however, was rather short-lived as by 1922 the cheap production of radium from the rich altered pitchblende deposits near Elizabethville in the Belgian Congo controlled by the Union Minière du Haut Katanga Company, rendered it impossible to work at a profit the carnotite deposits of Colorado and Utah. As a result of this changed condition capital amounting to several million dollars invested in mines, plants for the isolation of radium, vanadium, and uranium, and for the manufacture of apparatus for the handling of radium was rendered nonproductive. The United States Radium Company in 1923 made an effort to isolate radium in the United States but only on a small scale, while the Standard Chemical Company operated on an experimental basis its mill in Colorado for the concentration of the vanadium-bearing sandstone associated with the carnotite deposits.

The price of radium had been $120,000 a gram but in 1922 it had fallen to $70,000 per gram. American companies, after closing down their own mines, undertook to market the African product and up to 1924 that material ruled the market. The Katanga ore was shipped to Oolen, about 40 miles from Antwerp, Belgium, where it was treated at the plant of the subsidiary company. This single plant was said to have a capacity of 3 grams of radium (element) per month, which was about the total capacity of all the plants that once operated in the United States.

Interest also was aroused by the report of a Soviet Commission on ore deposits at Tyuya Muyun, in Russian Turkestan. The ore was believed to be tyuyamunite, hydrous calcium-uranium vanadate, and according to the commission there was sufficient ore of good grade to yield 15 to 20 grams of radium, 60 tons of uranium, 90 tons of vanadium, and 120 tons of copper. Even on this basis, however, the ore would be too lean to compete successfully with that from Katanga. In Portugal one of the mines worked during the year 1923 was said to yield an ore carrying as much as 6 per cent of uranium oxide, while in Madagascar and in Cornwall certain ore deposits also were worked. There was, however, every reason to believe in 1924 that the Belgian interests would be able to control the markets of the world for some time and that prices would continue to stand firm.

RAILWAY LABOR BOARD. See RAILWAYS.

RAILWAYS. After the United States entered the War there was a short period during which an attempt was made to continue the operation of American railways under private management, but under the authority of the War Department and other governmental agencies. Priority orders were the cause of the failure of this attempt and led to government operation of the railroads.

Priority orders were designed to expedite the movement of such freight as was most urgently required. This, of course, required discrimination between different classes of freight, and such discrimination was supposed to rest with

the military authorities at Washington. It soon became expedient to delegate this authority to subordinate officers, and conflicting priority orders brought about so great a confusion that railroad operation generally became demoralized

The final effort to avert government operation was made when a committee of five railroad men —consisting of Fairfax Harrison, president of the Southern Railway, Samuel Rea, president of Pennsylvania, Julius Kruttschnitt, chairman of the executive committee of the Southern Pacific; Hale Holden, president of the Chicago, Burlington, and Quincy, and Howard Elliot, formerly president of the New York, New Haven and Hartford—was appointed by the Association of Railway Executives and other executives at a meeting held in Washington, Apr. 11, 1917. At this meeting the executives pledged themselves to follow the orders of the committee, which they had themselves elected, regardless of competitive conditions and the individual necessities and preferences of each road Most of the executives called meetings of their boards of directors and had their action, in thus delegating their authority, confirmed by vote of the board.

Had it not been for the continual conflict of priority orders this experiment might have worked out, although even under the stress of war conditions and the stimulation of patriotic desires, it was found almost impossible to overcome the habits and prejudices of a lifetime of competition Even with the sincerest desire to be of use to the country, some railway executives found it nearly, if not quite impossible to carry out orders that would result in loss to their company and gain to a competitor.

The opportunity to show what cooperation, intelligence and genius could do when actuated by disinterested motives was as great as anything that American railway history has presented. Heretofore the greatest mileage which had ever been under the direction of one man in the United States was the Harriman system of approximately 23,000 miles Such a system, however, was competitive throughout its length with other independently operated railroads. The Fairfax Harrison committee had pledged to it the cooperation of the managers of 260,000 miles of railroad, and the complete elimination of competition. The greatness of the opportunity and the undoubtedly sincere desire of most of those concerned in the experiment was not sufficient to make it a success.

On Dec. 26, 1917, President Wilson issued a proclamation fixing Jan 1, 1918, as the date on which the executive branch of the United States government should take charge of the operation of the principal railroads of the United States. William G. McAdoo, Secretary of the Treasury, was appointed Director-General of Railroads, and on January 1 took over the properties. On Jan. 28, 1918, Congress passed a law embodying the terms under which the government operated the railroad properties Under this law the government took over the supplies and all current assets as of Jan 1, 1918, and assumed the payment of railroad employees' and officers' salaries, and of all the expenses of operation. It likewise collected freight and passenger revenues Thus, the railroad properties, including their current assets, were rented to the government for a fixed annual sum equal to the average operating income for the three years ended June 30, 1917. It was agreed that the government should make such additions and betterments to the properties as was found necessary to enable them to satisfactorily perform the service, first, of carrying supplies for the government and moving of troops, and second, of performing the civilian requirements for movement of freight and passengers.

It was found necessary to make a separate contract between the government and each one of the railroad companies. An attempt was made to standardize this contract on the basis of the annual rental equal to the average annual net operating income for the three years ended June 30, 1917. The majority of the railroad companies signed this standard contract, but others refused to sign it and were operated during the entire period of government operation with the basis of their rental undetermined.

The Government's Railroad Organization. The Director-General formed a staff which included an Assistant Director-General, a Division of Law, a Division of Finances and Purchases, a Division of Operation, a Division of Traffic, a Division of Capital Expenditures, a Division of Labor, a Division of Public Service and Accounting, and an Actuary to the Railroad Administration. The country was divided at first into three regions, eastern, northwestern, and southwestern. A. H Smith, president of the New York Central, was made director of the Eastern Region, R H. Aishton, president of the Chicago & North Western, was made director of the Northwestern Region and C. H. Markham, president of the Illinois Central, was made director of the Southwestern Region It was soon found necessary to expand this organization, and the country was divided into seven regions. The eastern region included the territory bounded on the north by Canada, on the west by Lake Michigan and the Indiana-Illinois State line, and on the south, roughly, by the Pennsylvania line, from Philadelphia to Chicago. The Allegheny region took in the Pennsylvania Railroad as far west as Pittsburgh, the Baltimore and Ohio line as far west as Pittsburgh, and the other lines in that territory which included New Jersey, the greater part of Pennsylvania, Delaware, Maryland, and the northern slice of West Virginia. The Pocahontas region included the principal bituminous coal roads, the Norfolk and Western and the Chesapeake and Ohio, and other roads in Virginia, and the larger part of West Virginia, and part of Kentucky. The southern region included all of the southeastern States from the North Carolina-Virginia line south to the gulf, and west to the Mississippi. The northwestern region included the territory bounded on the north by Canada, and on the east by Lake Michigan, and on the south by a line running irregularly from Chicago to the southern boundary of Oregon, and on the west by the Pacific. The central western region was bounded on the north by this southern line of the northwestern region, on the east by the Illinois-Indiana State line, on the south by a line zigzagging southwest from Cairo, Ill, to the southern boundary of New Mexico, and on the west by the Pacific. The southwestern region was bounded on the north by this southern boundary of the central western region, on the east by the Mississippi, and on the south and west by the Gulf of Mexico, and Mexico.

In his instructions to regional directors, Director-General McAdoo said, "Broadly speaking, I wish to give you power to direct railroad operations in your territory so as to handle traffic with the least congestion, the highest efficiency, and the greatest expedition. . . . I have put upon you responsibility for the entire operating situation." Notwithstanding this responsibility, however, the regional directors were not given the authority to appoint officers actually in charge of the operation of the railroads in their territory. The Director-General appointed "Federal managers" and "general managers" The Federal manager or general manager was in charge of a particular railroad. The difference in titles is a difference in the size of the road managed, and presumably in the salary. Thus, a Federal manager was appointed for the New York, New Haven, and Hartford, while a general manager was appointed for the Central Vermont

In making his appointments, both for the central administration and the regional administrations, the Director-General selected railroad men of long experience and marked ability. Thus, Carl Gray, of the division of operation, was chairman and president of the Western Maryland, and formerly had been president of the Northern Pacific. Edward Chambers, director of the division of traffic, was vice president of the Atchison, Topeka, and Santa Fé, and Robert S. Lovett, director of the division of capital expenditures, was chairman of the executive committee of the Union Pacific. One of the ablest of railroad lawyers, Walker D. Hines, chairman of the board of the Atchison, Topeka and Santa Fé, was appointed assistant director general. As regional directors, there were A. H. Smith, president of the New York Central, C. H. Markham, president of the Illinois Central, Hale Holden, president of the Chicago, Burlington, and Quincy, B. F. Bush, president of the Missouri Pacific, etc. In the appointment of Federal and general managers, in general, the chief operating officer of the road under the old corporate management was appointed under the government organization In cases where the president of the road was its chief operating officer, rather than the controlling interest in the management of the company, he was appointed Federal manager. Thus, E. J. Pearson, president of the New York, New Haven, and Hartford, was made Federal manager of the road. On the other hand, where the president of the company was an executive, rather than an operating officer *employed* by the board of directors, he did not enter the government service, but remained as an officer of the corporation. Thus, Samuel Rea, president of the Pennsylvania, did not become Federal manager of the Pennsylvania, but remained an officer of the corporation, and Elisha Lee, who had been general manager of the Pennsylvania lines east of Pittsburgh, was appointed Federal manager. The line of cleavage between the men who remained corporate officers and those who were appointed Federal managers might form the basis of immensely interesting study, not only in railroad development, but in the economic development of any great American industry. Mr. McAdoo fixed the salary of regional directors and Federal and general managers high enough to command the services of the long experienced, successful, and able railroad officers. On the other hand, he did not take into his organization men to whom a salary, even of $50,000 a year, was not of paramount importance, and, it might be mentioned, men whose services could not be measured by a salary, however great. The value of an E. P. Ripley to the Atchison, Topeka, and Santa Fé, of an L. F. Loree to the Delaware and Hudson, or a Samuel Rea to the Pennsylvania is something that cannot be purchased for so much a month, or so much a year.

The regional directors were given authority to operate the roads in their territory, subject only to general orders from the central administration The actual responsibility of operating the roads, however, fell on the Federal and general managers. Furthermore, general orders included orders dealing with wages and working conditions. Thus, the authority of the Federal manager was in part taken away by the regional director, and in part undermined by the central administration in its dealings direct with labor. In the opinion of probably the majority of railroad officers, high and low, this separation of authority from responsibility proved a great weakness in the railway organization.

The Labor Situation. The first order issued by the Director-General was one calling upon employees to continue in the performance of their regular duties. This was on December 29. On December 31, the railroads' war board resigned and on January 21, a railroad wage commission was organized, consisting of Franklin K. Lane, Secretary of the Interior, C. P. McChord, member of the Interstate Commerce Commission, J. Harry Covington, chief justice of the Supreme Court of the District of Columbia, and William R. Wilcox, formerly of the New York public service commission. This board listened to the testimony of various classes of railroad employees, and early in March made a report in which it recommended that an advance in wages be given to all employees, on a sliding scale of percentages, figured on the rates of pay in effect in December, 1915, these percentages ranging from a maximum of 43 per cent for the man receiving $46 or less a month to no increase for the man receiving $250 a month or more. The basis of the award was the increased cost of living. On May 25, the Director-General issued order No. 27, which gave the advances recommended in the committee's report, but advanced the wages of common laborers and shop men more than was recommended, this being found necessary in order to hold the men; the demand for common labor and for shop men in other industries was so great that the railroads had to meet the higher wages offered by these other industries. Order No. 27 was followed by many supplements which were, of course, in the nature of additional wage increases.

Thus, supplement No. 8, issued September 10, did away with the percentage advances in wages insofar as they applied to track laborers and track foremen, and gave a straight advance of 12 cents per hour to track laborers over the rate in effect Jan. 1, 1918, with a minimum of 28 cents and a maximum of 40 cents per hour. Track foremen were advanced $25 per month, with a minimum of $100 per month. Supplement No. 10 increased telegraphers', telephone operators', agent telegraphers', etc., wages by about $25 per month, with a minimum wage of $95 per month. In general, the application of Order No. 27 would have deducted any increases

in pay received since December 15 from the percentage increase that was made by the order, but the increase in wages which enginemen and trainmen received as the result of the eight-hour law, passed in 1917, was exempted, and they received the full increase provided in the order, without any deduction for the change from a ten- or nine-hour basis to an eight-hour basis. The wage awards in most cases were retroactive so that they applied to the entire calendar year 1918.

Rate Increases. On February 4 a bill embodying in general the principles laid down in President Wilson's proclamation taking over the roads was reported to the Senate, and on February 22 was passed by the Senate, on February 28 by the House, and was approved March 21 by President Wilson. In the meantime, demurrage rates, which are charges made by the railroad against a shipper who holds cars beyond a certain period, were increased, and the Director-General ordered that the expenses of financial and corporate officers as distinguished from operating, engineering, and traffic officers, should not be charged to the operating expenses of the railroad, thus making them a charge which had to be paid out of the rental received by the companies from the government. This was followed by the discontinuance of off-line traffic offices, and the discharge from service of traffic solicitors. On May 25 a general advance was made in freight and passenger rates All passenger rates were raised to a straight 3 cents a mile, with an additional charge of ½ cent a mile for occupants of Pullman cars This was an increase of 50 per cent in places in the East, and from 25 to 50 per cent in the West. The increase in freight rates was roughly 25 per cent. The greatest increase in freight rates that the railroads themselves had ever asked for was 15 per cent, and the Interstate Commerce Commission, even under war conditions, had refused to grant a straight 10 per cent increase. The increase made by the Director-General was, of course, in addition to all increases of less than 10 per cent allowed in the previous year by the Interstate Commerce Commission. The State commissions asked the administration to suspend rates, but this request was refused, and on July 1 it was announced that rates would be changed by the administration without waiting for the permission of the Interstate Commerce Commission. In November the charge of an extra ½ cent per mile for passengers traveling in Pullman cars was withdrawn, the pressure of public opinion and the expressions of discontent being so numerous that the railroad administration yielded to them, despite the fact that either on a theory of cost of service or of value of service the extra ½ cent charge was entirely justifiable and equitable.

The Equipment Situation. When the Director-General took charge of the roads there was a severe car shortage, due to congestion of traffic in New England and at the eastern seaboard. There was also a shortage of locomotives, in part due to the unparalleled demand for transportation, and in part to extraordinarily severe weather conditions.

In April, 1918, the Railroad Administration placed an order for 100,000 standard freight cars divided as follows: 25,000 40-ton double sheathed box cars; 25,000 50-ton single sheathed box cars; 20,000 50-ton composite gondola cars; 5000 70-ton low-side gondola cars; 25,000 55-ton hopper cars.

Notwithstanding the need for additional cars, only 13 per cent of the above order was delivered during 1918. Of the total 2030 standard locomotives ordered by the government, 678 were delivered up to December 21 During 1918, there were built 6475 locomotives, of which 3668 were on domestic orders, and 2807 on orders for the United States military railroads outside of the United States and Canada. In 1917, there were 5446 locomotives built, of which 2585 were for domestic service, and 2861 for export. In 1907, 7362 locomotives were built. There was a total of 124,708 freight cars built in the United States and Canada in 1918. This compares with 151,401 built in 1917, and 284,188 built in 1907. In 1918, there were 1573 passenger cars built, comparing with 2000 built in 1917, and 5457 built in 1907.

The United States Railroad Administration ordered 2030 standard locomotives for use in the United States. The first order, for 555 locomotives, was given to the American Locomotive Company, and one for 470 to the Baldwin Locomotive Works. This was supplemented by a further order for 249 locomotives from the American Locomotive Company, 100 from the Baldwin and 45 from Lima. The types of locomotives ordered were the standard heavy Mikado weighing 320,000 pounds with cylinders 27 x 30; the light Mikado weighing 290,800 pounds with cylinders 26 x 30; the light Mountain-type locomotive weighing 320,000 pounds with cylinders 27 x 30; the heavy Mountain-type locomotive weighing 352,000 pounds with cylinders 28 x 30; the light Pacific-type locomotive weighing 270,000 pounds with cylinders 25 x 28; the heavy Pacific-type weighing 300,000 pounds with cylinders 27 x 28; the light Santa Fé type weighing 352,000 pounds with cylinders 27 x 32 and the heavy Santa Fé type weighing 390,000 pounds with cylinders 30 x 32.

The discussion of standard types of equipment for railroads over the entire country was one which developed wide differences of opinion. Standardization had become so much a catchword that the railroad administration had no difficulty in convincing the general public of the great economies, both in the cost of building and of operation, of a few standard types of locomotives and cars. The corporations owning the railroads protested vigorously against drastic standardization. It would appear from testimony and discussion on this point that there were sound arguments for standardization of certain types of freight cars. Freight cars travel all over the country, and the advantages of having repair parts, etc., on whatever road the car might happen to be, are real, and of importance On the other hand, in general, locomotives are confined to service on the road that owns them, and more often than not, to a single operating division of that road. The Pennsylvania railroad, which has for years dealt with its locomotive and equipment problems in a more scientific way than any other company, had gone further toward designing locomotives especially for the work which they were to do, and for the division on which they were to operate, than had any other company.

Even after the Railroad Administration had relinquished control, the controversy between the Administration and railroad officers, working for the Administration but still loyal to the com-

panies which had employed them, had been forgotten, there were differences of opinion as to whether the standard design of locomotive was an economy in the long run and whether standardization of locomotive design was desirable and economical. The truth appears to lie somewhere in between the divergent views. The standard locomotives were better than those ordered prior to government operation by many roads. On the other hand, the standard locomotive was not as well designed a type for the particular nature of the work on some roads as the engineers of the private companies had designed.

Both cars and locomotives were ordered at a time when prices were at the peak. The Railroad Administration assigned—of necessity arbitrarily—cars and locomotives to the various properties as the needs of traffic seemed to require. This equipment, of course, became a capital charge against the railroads owning the various properties. Naturally there were protests against assignments and some friction between the Railroad Administration and the railroad executives. At about the time, however, that the railroads were returned to the owning companies a car shortage began to develop and the companies, in general, were willing to take the assignments made to them.

To finance these purchases the companies issued equipment trust certificates up to the full cost of the equipment and the Railroad Administration took these equipment trust certificates into its treasury. It had been customary for private companies, in financing the purchase of cars and locomotives, to issue equipment trust certificates against only 75 to 80 per cent of the total cost of the equipment, and for the company to furnish out of its current funds the 20 or 25 per cent equity. Since there was no equity in the so-called government equipments, it was thought that investors would be loath to buy from the government these equipment trust certificates which matured serially. It was found, however, that with strong companies like the Union Pacific, the Pennsylvania, and the New York Central, investors were very willing to buy equipment trust certificates even where there was no equity.

In the case of the weaker roads the government, in order to relieve itself of some of this burden, stamped 25 per cent of the equipment trusts as subordinate in lien to the other 75 per cent, and investment bankers found a comparatively ready market for the 75 per cent of certificates that were prior in lien to the 25 per cent the government continued to hold Eventually a good many of the so-called subordinated equipments were sold by the government to bankers and found their way into the hands of investors There were no defaults on any of these equipment trust certificates.

The railways, uncertain of their credit and of business generally, were loath to place orders for equipment after the roads were returned to their owners, and the orders for domestic locomotives in the last year of government operation and the first two years following government operation, were as follows: 214 in 1919; 1998 in 1920; 239 in 1921. By 1922, it had become obvious that the railroads would need a great many more locomotives and cars if they were to handle satisfactorily the business that appeared likely to develop in 1923. Orders were placed during 1922 for 2600 locomotives, 2382 passenger cars and 180,154 freight cars. Deliveries of the orders placed in 1922 were made in the latter part of 1922 and during the year 1923, and the railways met the requirements of the heavy crop movement of the fall of 1923 without serious car shortage.

Extensions. The government policy of railroad development rests on the belief that consolidation of facilities would result in economies. Extensions played almost no part in the government's programme. There was, therefore, very little new railroad building during all the period of government operation and the two years immediately following, but in 1923 there was a resumption of considerable railroad building. In 1918, there were 721 miles of railroad line completed; in 1919, 686 miles; in 1920, 314 miles; in 1921, 475 miles; in 1922, 324 miles, and in 1923, 427 miles.

Service. It is generally conceded to be quite unfair to use the quality of service furnished by the railroads under the Railroad Administration as a measure of government operation of railroads. Service in hotels, department stores, and every other branch of activity where employees come in contact with the general public, deteriorated under war conditions. Certain facts, however, may be pointed out as regards the operation of the railroads; the administration of labor was not delegated to the Federal managers but was controlled from Washington on what was generally conceded to be a political basis. The effect on wages is discussed elsewhere but the effect on service was quite important. Without effective control over the terms of employment it was quite impossible for the Federal managers to exact service to the public, and it is thought by some people that service of the railways was even more adversely affected than service in lines of industry that remained under private control

One item of service deserves special mention. The Railroad Administration undertook to change the dining-car system. A standard meal was served at a standard price—the dinner was $1.50. Exactly the same menu was served by the great majority of railroads and each day in the week had its standardized menu. The result might have been foreseen and protests were raised everywhere. Men who traveled day after day found the system thoroughly distasteful and the experiment served to show that, despite all the dissatisfaction there has been with private-company operation of American dining cars, the easy method of standardization is not the satisfactory way out.

Accounts with Government. The long and involved process of adjusting the accounts between the government and the railroads, which were taken under Federal control in December, 1917, and relinquished in 1920, had been concluded by 1924. The Railroad Administration had completed its settlements with all of the important roads which it operated. The Interstate Commerce Commission had completed the adjustment and had issued final certificates for payment by the Treasury Department of most of the accounts involved in the six-month guarantee allowed by the Transportation Act for the period following the termination of Federal control.

All the financial relations however, between the railroads and the government, arising from the War and the government's assumption of railroad operation, could not be terminated by

that year, because many railroads gave the government various forms of evidences of indebtedness for the capital expenditures made by the government, and there were still outstanding in 1924 many loans made by the Interstate Commerce Commission from the $300,000,000 revolving fund established by the Transportation Act to help tide over the transition period.

Railroad Administration Settlements. Of the 241,194 miles of road taken over by the government, roads operating 178,045 miles had effected final settlement before the year 1924 Except for the short-line roads, which had a different status, the settlements, which involved original claims of the railroads amounting to $1,014,511,000, were completed without litigation and a detailed report was being compiled Up to Dec. 1, 1923, the settlements represented original claims of $953,473,000, although some of them were reduced during the course of the negotiations This does not mean that the Railroad Administration had to pay out anything like that sum after February, 1920, because the amounts due the railroads on current account, such as delayed payments of their guaranteed compensation as well as amounts for materials and supplies, under-maintenance, depreciation, interest and other items, were offset against the amount of capital expenditures made by the government and charged against the companies. The Pennsylvania, for example, paid the government $90,000,000 as the excess of its indebtedness to the government over the government's indebtedness to it Some few roads paid the Railroad Administration for over-maintenance but up to December, 1923, the government had paid the railroads a net amount of $188,401,235 for under-maintenance, including $159,657,979 for maintenance of way and $28,743,256 for maintenance of equipment The roads had claimed an aggregate of $668,000,000 for under-maintenance A considerable part of the amounts owed by the railroads for capital expenditures was funded. In 1924, there were still pending a good many claims against the Railroad Administration on the part of short lines and "third persons" such as claims of shippers for overcharges and loss and damage claims.

Six-Month Guarantee. The claims of the railroads for the six-month guarantee amounted to about $657,000,000 but the Interstate Commerce Commission reduced the amount after checking the accounts. In 1920 it estimated the amount payable as about $536,000,000 and in two later annual reports it adhered to this estimate. As of Oct. 31, 1922, the commission estimated that $85,926,954 was still due the carriers Up to Oct. 31, 1923, final settlements had been made with 355 carriers, 110 cases had been dismissed and 202 cases were still to be disposed of. Certificates had been issued to the amount of $501,322,674 (and the actual payments by the Treasury approximate that amount), leaving an estimated balance payable of $34,677,325 which was somewhat reduced by additional certificates during the early part of 1924.

A total of 352 carriers, mainly short lines, had filed claims amounting to approximately $25,000,000 for reimbursement of deficits for the Federal control period under section 204 of the Transportation Act. At the date of its report the commission had certified $8,205,630 on this account and after many claims had been dismissed or withdrawn, 92 were left for final disposition.

Loan Fund. Under section 210 of the Transportation Act, which established the $300,000,000 loan fund, the commission has allowed loans to the amount of about $350,000,000, the original fund having been increased by interest and repayments. On Dec. 1, 1923, a total of $147,862,592 had been repaid Under the law loans subsequent to Feb 28, 1922, were made only on applications filed prior to that date but as recently as December 5 the commission allowed a loan of $7,000,000 to the Boston and Maine.

The statement of the Treasury Department on the subject, as of Dec. 1, 1923, shows total payments to the railroads under the Transportation Act amounting to $893,984,588, exclusive of the payments by the Director-General of Railroads, but this includes the loans, some of which have been repaid. During the year 1924, it should be possible to ascertain with some degree of accuracy the total cost to the government of Federal control of the railroads, which was estimated at $1,700,000,000 to $1,800,000,000, including approximately $550,000,000 for the six-month guarantee period and the reimbursement of short lines, but the exact figure can not be known as long as the loans and the funded indebtedness of the carriers remain outstanding.

Relinquishment of Government Control. William G. McAdoo, as Director-General of Railroads, advocated the extension of government operation for a period of years after the end of the War. There was a great deal of political discussion of the question and the question of government ownership was raised. Public sentiment, however, was so obviously against government ownership, which Mr. McAdoo advocated, that he fell back on his proposal for an extension of government operation This did not meet with the approval of Congress and two bills were drawn up: that known as the Cummins Bill in the Senate and the Esch Bill in the House. These two bills were finally consolidated and passed as the "Transportation Act, 1920" which recites that it is "An Act to provide for the termination of Federal control of railroads and systems of transportation; to provide for the settlement of disputes between carriers and their employees; to further amend an Act entitled 'An Act to regulate commerce,' approved Feb 4, 1887, as amended, and for other purposes." The three important changes which the "Transportation Act" made in the act to regulate commerce were: (1) A duty is placed on the Interstate Commerce Commission, in making freight and passenger rates, to make such rates as will allow the railroads as a whole, in one territorial group, to earn a fair return on their valuation as fixed by the Commission; (2) A scheme for voluntary consolidations of the railroads is provided for and this is so closely connected with the fair return provisions of the Act that the two will be discussed together; (3) The Act creates a Railroad Labor Board of nine members, three representing the public, three the railroads and three the railroad employees It was provided that in any disputes regarding wages, the railroad managements would attempt to arrive at a settlement with their own employees, and failing this, either side could bring the dispute before the Railroad Labor Board. It was the duty of the Railroad Labor Board then to make an investigation of the facts and come to a conclu-

sion, making public its findings, but there was no power given the board to enforce its findings through the application of penalties.

Both the railroad employees and the railroad managements have in certain instances refused to follow the findings of the board, but notwithstanding this it is probably the consensus of opinion among railroad managements that the labor board is an improvement over the former method of dealing with railroad employees

The strike of the railway shopmen which took place in 1922 was in defiance of the findings of the Railroad Labor Board. The shopmen, who had been organized and had become affiliated with the American Federation of Labor, during the government operation of the roads, had asked for an increase in wages. The Railroad Labor Board made an investigation of living conditions and wage scales in other lines of industry, and fixed as fair wage a somewhat lower rate than the shopmen had asked for. A strike was called on July 1, 1922, and the question was bitterly fought out The Labor Board issued a public statement in which it said that the strike was in defiance of justice, but it continued to work for the reconciliation between the men and the managements. The strike was peculiarly bitter in the southwestern part of the United States. Here the families of employees who remained loyal to the company were persecuted and innumerable acts of cruelty to men and their families were committed in the name of the striking shopmen.

The Association of Railway Executives carried on negotiations with representatives of the American Federation of Labor and in the meantime the officers actually in charge of the operation of the railroads attempted to replace the striking shopmen and to carry on railroad service Railroad service was actually carried on without any serious interruption although there were delays and the cost to the railroads was extremely heavy. Finally the labor union took the position that if its men should be restored to their seniority rights and the men employed in their places should be discharged or demoted, the strikers would return to their work at the Labor Board wage scale. In many instances the railway executives had given their personal word to the men employed in the place of strikers that they should retain their newly gained seniority rights and continue to hold their jobs The Association of Railway Executives separated into two groups: one group settling with the strikers under the so-called Baltimore plan, by which the strikers were granted, in substance, the demand for reinstatement with restored seniority rights, the other group refusing to settle. The second group included some of the best managed railroads in the United States; for instance, the Union Pacific. Theoretically the strike against these roads continued on through 1922 and 1923 Actually, however, by 1923 the new forces, even on the southwestern roads such as the Missouri Pacific and the St. Louis-Southwestern, had been organized and were functioning smoothly.

The most notable instance of the refusal of railroad management to follow the finding of the Railroad Labor Board was in the case of the Pennsylvania Railroad which formed unions of its own employees, of which only employees were officers. This, of course, excluded the professional labor leader of the American Federation of Labor. The scheme was fought bitterly by the American Federation of Labor and was brought before the Railroad Labor Board, because when the election of men to represent employees before the Board took place on the Pennsylvania, the followers of the American Federation of Labor refused to vote for men who were Pennsylvania Railroad employees On the other hand, the Pennsylvania Railroad management insisted that only employees of the Pennsylvania should represent employees before the Labor Board The Labor Board held that the men had a right to elect American Federation of Labor or other professionl labor leaders to represent them and that the Pennsylvania was wrong. The Pennsylvania management was engaged in 1923 in attempting to get the question before the Supreme Court.

Consolidations. In connection with the provision in the Transportation Act which lays a duty on the Interstate Commerce Commission to fix rates that will yield a fair return, leaving no recourse to the railroads, however, if this duty is not lived up to, and leaving it entirely to the commission to decide what is the fair rate of return, there is also a provision which establishes a revolving fund and provides that any railroad company that earns in excess of 6 per cent on its valuation in any year shall pay into the revolving fund one-half of the excess earnings and retain the other half as a fund to make up deficiencies in following years.

The framers of the Transportation Act of 1921—the Esch-Cummins bill—were acutely aware of the "weak" and "strong" railroad problem, and they made a provision that if one company earned more than 6 per cent on its valuation the excess earnings should be appropriated in part by the government, to be distributed as a loan or otherwise to the companies in the same group that were unable to earn a fair return on the value of their property.

The change of attitude on the part of the government, which that Transportation Act expressed, consisted (1) in a recognition of the principle that capital invested in railroads, taken as a whole, should be permitted to earn a fair rate of interest; and (2) in a recognition of the fact that under the same rates some railroad companies would earn more than a fair interest rate on their investment and others would earn less. It was, further, a recognition of the fact that the so-called "weak" roads must be kept in business; and it laid down the somewhat socialistic doctrine that since railroads were not created equal the government could take from the strong and give to the weak. Apparently there was doubt as to the constitutionality and the sound economics of this doctrine, and an attempt was made to attain the same end by providing for the consolidation, under one company, of weak and strong roads.

"The commission shall as soon as practicable prepare and adopt a plan for the consolidation of the railway companies of the continental United States into a limited number of systems" The Transportation Act goes on to explain that in making plans for consolidations, the Interstate Commerce Commission shall preserve competition as fully as possible and disturb existing routes of trade as little as possible. The commission is not given power to force consolidations but has the power to prevent consolida-

tions which are not in accordance with its plans.

The commission employed Prof. William Z. Ripley to formulate a tentative plan of consolidation, and he divided the railroads of the United States into 21 systems. For rate-making purposes the commission had already divided the United States into four sections, and Professor Ripley arranged the roads in systems so as to keep each system wholly within a rate group.

The Ripley plan put the railroads lying in the trunk-line territory (eastern rate group) into five systems, each having a through line from New York to Chicago. Thus the Pennsylvania system utilized the through line of the Pennsylvania and its affiliated companies; the New York Central system utilized the New York Central through line; the Baltimore & Ohio-Reading system made use of the Baltimore and Ohio line from Philadelphia and Baltimore to Chicago and added to it the Philadelphia and Reading and the Central of New Jersey—giving it a line into New York; the Erie and Lehigh Valley-Wabash system used the Erie through line between New York and Chicago; and the Lackawanna-Nickel Plate system combined the Delaware, Lackawanna and Western line from New York to Buffalo and the New York, Chicago and St. Louis line from Buffalo to Chicago.

The grouping of the railroads for rate-making purposes recognizes that the roads in New England and the roads in the Michigan peninsula each has characteristics as to traffic, etc., peculiar to itself. Professor Ripley therefore made one railroad system out of the New England roads and one system out of the roads in the Michigan peninsula.

The roads that run between the coal fields of West Virginia and tidewater on the east and middle-western cities on the west have both operating and traffic conditions which are peculiar to themselves. These roads Professor Ripley combined into two systems: one the Chesapeake and Ohio and the other a combination of the Norfolk and Western and the Virginian Railway.

It will be noted that Professor Ripley preserved ample competition in suggesting five trunk-line systems, and adequate competition in suggesting two soft-coal systems; but he made no provision for competition in the New England system or the Michigan peninsular system.

The southeastern rate-group region roads were parceled out among five systems under the Ripley plan, two of these corresponding quite exactly with the present affiliation of roads. The Southern Railway system was left almost intact, and the Atlantic Coast Line-Louisville and Nashville system is the same as the present grouping of roads under the control of H. H. Walters and his associates.

The third system was a consolidation of various roads with the Illinois Central, the fourth system a consolidation of various roads with the Seaboard Air Line, and the fifth a consolidation of a few roads with the Florida East Coast Railway.

The Ripley plan consolidated the roads west and southwest of Chicago into seven systems, five of which he grouped together as a western-transcontinental region and two as a southwestern Gulf region. The systems in the western transcontinental region consisted of consolidations based on (1) Union Pacific, (2) the Chicago, Burlington and Quincy-Northern Pacific, (3) the Chicago, Milwaukee and St. Paul-Great Northern, (4) the Chicago, Rock Island and Pacific-Southern Pacific, and (5) the Atchison, Topeka and Santa Fé. The two systems in the southwestern Gulf region were founded on the St. Louis and San Francisco and on the Missouri Pacific.

The most important contribution from railroad officers themselves toward a consolidated plan was that of Hale Holden, president of the Chicago, Burlington and Quincy, which divided all of the roads west of Chicago and New Orleans into four systems, giving each system two routes from the eastern base line to the Pacific Coast, giving each system lines to Minneapolis and St. Paul and giving each system lines into the southwest.

The year 1924 saw the beginning of what apparently was a restoration of railroad credit and saw the railroads themselves in better physical condition than at any time since 1914. See RAPID TRANSIT.

RAILWAYS, ELECTRIC. See ELECTRIC RAILWAYS

RAISA, ROSA (1893–). A Russian dramatic soprano, born at Bielostok. To escape the horrors of the Jewish persecutions her parents fled (1907) to Naples, where she received her musical education at the Conservatory under Barbara Marchisio. She made her début at Parma (Sept 6, 1913) in Verdi's *Oberto, Conte di San Bonifacio,* during the Verdi centenary celebration under Campanini, the director of the Chicago Opera Association. Campanini engaged her the next year for Chicago, where she remained as one of the principal stars and a prime favorite. She has also appeared with brilliant success in London, Rome, Buenos Aires, Montevideo, Rio de Janeiro, São Paulo, and New York. Toscanini chose her to create the rôle of Asteria in the world première of Boito's *Nerone* (Milan, May 1, 1924) In 1920 she married the operatic baritone Giacomo Rimini.

RAISULI, ACHMED BEN MOHAMMED (1875–). A Moroccan bandit and political leader (see VOL. XIX). Instigated by Germany, he raised a revolt against the French government in Morocco in 1918 and continued active until 1923, when he surrendered to the French. He was also a leader in the Riff rebellion against Spain in Spanish Morocco. See MOROCCO.

RAND, HERBERT WILBUR (1872–). An American zoölogist, born at Oil City, Pa, and educated at Allegheny College and Harvard University. He was assistant principal of the high school at Oil City (1894–96), and at Harvard he was instructor in zoölogy (1900–09), assistant professor (1909–19), and associate professor (1919–). He published articles mainly on regeneration in animals, especially the earthworm.

RANDOLPH-MACON WOMAN'S COLLEGE. An institution for women at Lynchburg, Va., under the auspices of the Methodist Church, founded in 1893. The number of students registered increased from 610 in 1914 to 767 in 1924, the faculty was increased from 47 to 53 members, and the library from 12,500 to 22,965 volumes. The total yearly income was increased from $183,227 in 1914 to $348,167 in 1922–23, and the endowment from $376,500 to $465,049. A Phi Beta Kappa chapter was installed in 1916, the Latin requirements for entrance were changed from four to three units, and nine hours' credits allowed for music. For

the degree, a grade of 85 in half the courses was required. Four buildings were erected, the Smith Memorial Student Building, Webb Dormitory, the president's home, and the observatory. A campaign was being carried on in 1923–24 for $1,250,000, of which all but $125,000 had been raised by January, 1924. President, Dice Robins Anderson, Ph.D.

RANGE. See ARTILLERY.

RANKIN, JEANNETTE (1880–). An American public official, born in Missoula, Mont., and educated at the University of Montana and the School of Philanthropy in New York City. She engaged in social work in Seattle and took an active part in woman suffrage work, she was field secretary of the National American Woman Suffrage Association. In 1917 she was elected to Congress as Representative-at-large from Montana and was the first woman ever seated in that body She was defeated for reelection in 1920.

RANSOME, FREDERICK LESLIE (1868–). An American geologist, born at Greenwich, England, and educated at the University of California. He was assistant in mineralogy and petrography at Harvard and entered the service of the United States Geological Survey where in 1900 he became geologist in charge of various sections of western areal geology (1912–16) and later of metalliferous deposits. He also lectured on ore deposits at Chicago in 1907 and was Silliman lecturer at Yale in 1913. During the War Dr. Ransome was connected with the National Research Council and became its treasurer in 1919. In addition to being an associate editor of *Economic Geology*, he is the author of many official monographs on the geology of western mining districts and papers in scientific journals.

RAPALLO, TREATY OF. See FIUME-ADRIATIC CONTROVERSY, PEACE CONFERENCE AND TREATIES.

RAPID TRANSIT. Notwithstanding the War and the unsettled condition of the various countries in the decade between 1914 and 1924, there was no single question that aroused more general interest in and about large cities than the provision of adequate urban and suburban transit facilities This was due in large measure to the phenomenal growth of the large cities particularly in the new countries, and the concentration of activities and industries in certain districts at a distance from available housing facilities

The problem was not entirely one of new or additional subways; there were cities where elevated railways were constructed in the period under consideration, and also cities where important readjustments and at times relocations of surface traffic were demanded so as to relieve in a measure the congestion which prevented the proper handling of the traffic especially at the times of peak load and when the streets were thronged with vehicular and pedestrian traffic.

The troubles were not only of construction. Between 1914 and 1924 costs of operation, due particularly to increased cost of materials and labor mounted so that in many American lines what was considered the standard fare of five cents became inadequate to meet even operating costs while in some parts of the United States the operation of interurban or suburban lines was no longer possible due to the competition of motor vehicles both public and private. In New York City in 1919 the New York City Railways and the Brooklyn Rapid Transit Company went into the hands of a receiver while the Interborough Rapid Transit Company later was saved only by careful financing.

So serious was this situation in the United States that in 1920 when the report of a Federal Electric Railway Commission, appointed by President Wilson, May 31, 1919, was issued, it was frankly stated that the electric railway industry was without financial credit and was not properly performing its public function. The reason for this was given as early financial mismanagement, various economic causes accentuated by high price levels of labor and materials, and the failure of the five cent fare to provide revenues adequate to meet operating costs, maintenance, and necessary extensions. See ELECTRIC RAILWAYS.

Throughout the United States there was a movement towards government operation and ownership, which often was revealed in oppressive measures of regulation that interfered with the efficient and profitable conduct of the various utilities. See MUNICIPAL OWNERSHIP.

New York City Subways. The 10 years 1914–24 witnessed important developments in New York, but also a disintegration of the existing system of surface lines and a failure of the municipal authorities to develop plans for additional much needed lines and to provide means to carry them into effect The so-called Steinway Tube under the East River from 42nd Street, Manhattan, to Long Island City was opened in 1915 as a part of the Interborough Rapid Transit system. The dual subway system was further developed and the various lines of the New York Municipal Railways including the Broadway subway were opened in 1917 and 1918 and were extended from time to time but the complete development of the dual system along the lines originally laid out was impossible on account of the hostility of the New York Municipal government which was favorably disposed toward city owned and operated transit facilities and absolutely opposed to any increase of fare over the time-honored five cents.

The carrying capacity of the elevated railways was extended by the building of third tracks over which express trains were run to take care of the heavy traffic at morning and night. In 1924, New York City had in operation over 600 miles of subway and elevated tracks of which the Interborough operated 361 miles and the Brooklyn-Manhattan Transit Corporation, a successor to the New York Municipal Railroad, 258 miles. Of the Interborough's lines, 222 miles were subway and 139 miles elevated railway.

The immensity of the transit problem in New York City is shown by the fact that the Interborough Rapid Transit in the year ended June 30, 1924, carried 1,074,343,243 passengers. Such traffic was handled under conditions of crowding and congestion and the same was true for the Brooklyn-Manhattan Transit Lines. There was an urgent need of additional subways and connections for which various plans had been prepared.

Boston. The Boston Transit Commission ceased to exist on June 30, 1918, after 24 years of existence during which it had developed a comprehensive traction system for that city and had supplied all of the facilities called for, or rather all that means were available for constructing. After the elevated railways had been constructed and the subway from Tremont

Street to Cambridge, the next section, the Boylston Street subway, running through the Back Bay District to the junction of Commonwealth Avenue and Beacon Street, was opened on Oct. 3, 1914. Following this came the section to Andrew Square, Dorchester, which was opened in 1916. In addition, there were completed the Washington Street and East Boston subways so that Boston had a well unified system of subways. Operation of the Boston Elevated Road passed into the control of a Board of Trustees on July 1, 1918, and to meet deficiencies in revenue the fare was raised from five to seven cents on August 1, and later in the year to 8 cents. Even this was insufficient to meet operating costs, as was a 10-cent fare adopted later

Philadelphia. Rapid transit development was an important feature in Philadelphia between 1914 and 1924 An existing subway ran east and west under Market Street, terminating in a short north and south elevated line along the river front, and on Apr. 26, 1915, the city voted a bond issue to provide for the construction of a subway which would cross under the older one at the City Hall and extend north and south under Broad Street. There was also involved an elevated line to Frankford which was completed in 1919 The next elevated line to be built was the Woodland Avenue section of the Darby route The construction referred to as gradually completed, however, did not meet the requirements and in 1923 a general and comprehensive plan was under consideration of which various extensions of the subway routes and elevated lines were decided on.

Chicago. The City of Chicago, with its surface and elevated railways, experienced a congestion of traffic no less than other American cities but in the decade under review little had been done beyond the preparation of plans and discussion.

Detroit. In 1923, the City of Detroit was so near its debt limit that little could be done in the way of bond issues for providing funds for developing increased transit facilities or improving then existing conditions.

Cincinnati. In 1915, plans for an extensive rapid transit system involving a belt line surrounding the city were adopted, and in the following year a bond issue for this purpose was authorized The execution of the project was postponed on account of the war until 1921, when the subway portion was put under active construction using for part of the route the abandoned Miami and Erie Canal, thus decreasing construction costs materially The loop as planned was about 16.45 miles in length and consisted of 2 45 miles of subways; 9 miles in the open cut with bridges or subways at intersecting streets; 0.2 miles of tunnel; 3.4 miles of concrete trestle, and 1 4 miles of concrete elevated structure. The line begins at Fountain Square and extends north in subway in Walnut Street, where it joins the canal and thence west in subway to Plum Street, where the line turns north in subway to Brighton whence a circuit is made returning to the starting-point Another important development in Cincinnati was the construction of a large double-decked terminal for interurban electric cars which served also as an annex to a large office building This terminal was connected by a viaduct with the Covington Bridge over the Ohio River. There was also accommodation here for the Newport cars which crossed on the Newport or Central Bridge and running on the surface entered the first floor of the terminal.

San Francisco. See SAN FRANCISCO.

St. Louis. With the development of its suburbs and the congested condition of traffic in its business district, the city of St. Louis was forced to take under consideration some plan in which the street railways would be extended and rerouted and conditions relieved as by the construction of a subway loop. The City Plan Commission, the Department of Public Utilities, and other organizations were considering this problem in its many bearings but no actual construction work was started up to 1924.

London. At the time of the outbreak of the War in 1914, the various city and suburban railway lines in and about London were engaged in various improvements and extensions. The suburban lines such as that of the London and Northwestern from Euston to Harrow were electrified, and the electrification of the line between Hammersmith and Earls Court of the District Railway Company vastly increased the daily number of trains The general plan was to tie in as far as possible the suburban lines with the urban tubes and to adopt electrification as rapidly as possible Naturally the War interfered with the immediate execution of many of the projects planned, but with the return of peace such plans were set on foot as the connection of the Central London line with the suburban system of the London and Southwestern Railway so as to afford an alternative route from the Hammersmith district into the city and to extend it as far as the suburban district of Ealing. The most notable improvement, perhaps, was the reconstruction of the City and South London line, the first and smallest of the many tubes which had been built in London This tunnel was increased to standard dimensions so that its traffic could be exchanged with the Hampstead line and provide for through traffic between the northern and southern districts of London. The scheme of extension undertaken also involved a connection between the City and South London Railway and the Charing Cross, Euston and Hampstead Railway extending from Euston to Mornington Crescent, and the extension of the Hampstead Railway from Golders Green to Edgeware In addition to the important passenger routes, an electrically operated underground rapid transit mail railway was built to connect the chief post offices and trunk line dépôts in the London district. The tubes have an inside diameter of 9 feet and contain a track of 2-foot gauge over which trains of motor cars are operated by a remote-control system.

Barcelona. In 1924, there was under construction in Barcelona, the commercial capital of Spain, a subway system which was designed to connect the surface railways entering the city from the east and west This work was intended to be completed in 1925, but on Apr. 12, 1924, there was a temporary setback when a portion of the vault in the centre of the mediæval city fell, causing a large breach in the street and the footways above. This accident caused the death of five laborers who were working underground, and injured 25; of the surface crew, 13 were injured

Madrid. In 1919, the City of Madrid had completed and put into operation the first 3 miles of its subway system extending from the

northern part of the city to Puerta del Sol, the centre of the business district. This was followed by construction carrying the line to the station of the eastern and southern railways.

Sydney, Australia. An interesting transit scheme was being developed for Sydney, New South Wales, which involved both underground and elevated lines and a combination of new urban facilities with those of existing routes. The urban and suburban railways were being electrified and extended into and around the city so as to form a city loop, from which railways were to lead to the western and eastern suburbs served by a street railway service system. This new work was being undertaken in connection with the electrification of the suburban steam railways terminating at the Central Railway Station on the city side of the harbor, and at Milson's Point. From there passengers would be brought into the city and distributed over four underground and two open-air stations on the city loop. See TUNNELS; BRIDGES.

RASMUSSEN, KNUD (JOHAN VICTOR) (1875–). A Danish Arctic explorer (see VOL. XIX). His voyages in Polar regions and acquaintance with the Eskimos furnished material for some unusually interesting books which include: *Liv i Gronland* (1915); *En Gronlands Drom* (1915); *Min Rejsedagbog* (1915); *Sermerssnakut Tunnliarnilerssomtit* (1910); *Nye Mannesker* (1919); *Gronland Langs Polhavet* (1921); and *Myter og Sagn fra Gronland* (1921), which in the English translation is called *Eskimo Folktales* (1921). Another work which appeared in English is *In the Home of the Polar Eskimos* (1923).

RASPUTIN, GREGORY. See RUSSIA, *History.*

RATHENAU, WALTER (1867–1922). A German political economist and statesman, born in Berlin, Sept. 29, 1867, and educated in the German technical schools. In 1899 he established the first factory for electrochemical specialties in Germany. He rose rapidly as an industrial organizer and leader and became in 1915 president of the all-powerful Allgemeine Electrische Gesellschaft. During the years 1908 and 1909 he served as an economic representative of the German government in the East African colonies. When the War broke out, he was in charge of official organization of the food supply but did not remain in office more than a year. After the German revolution, having identified himself with the radical parties, Rathenau was appointed Foreign Minister (1921). He went to the Genoa Conference with a policy of conciliation between Germany and the Allies. Although he negotiated a treaty of friendship with the Russian Soviet government (the Treaty of Rapallo), his Genoa mission did not accomplish its purpose. In June, 1922, he was assassinated at the instigation of reactionary groups, who could not forgive either his radical policy or his Jewish ancestry.

Rathenau was one of the few German leaders who combined a remarkable ability at industrial organization with philosophic grasp of the cultural needs of modern societies. His writings range from speculative philosophy of the type called professional to the problems of industrial efficiency, and they pass by the highly treacherous shoals of social and economic policy. His *Von Kommenden Dingen* (1918) and *Was Wird Werden,* translated as *In Days to Come* (1921), combine prophetic vision with a scientific understanding of sociological intricacies. His other works include three volumes of *Gesammelte Schriften* (1918); *Nach der Flut* (1919); *Die Neue Gesellschaft* (1919; English translation, *The New Society,* 1921); *Autonome Wirtschaft* (1919); *Der Kaiser* (1919); and *Der Neue Staat* (1922).

RAVEL, MAURICE (1875–). A French composer, born at Ciboure, Basses-Pyrénées. He received his musical training at the Paris Conservatoire under C. de Bériot (piano), A. Gédalge (counterpoint and fugue), and G. Fauré (composition). In 1901 he won the second Prix de Rome with a cantata, *Myrrha.* He never held any official positions but lived in Paris and devoted his entire time to composition. In 1920 he was made Chevalier of the Legion of Honor. As a composer he is one of the most prominent of the impressionists, second perhaps only to Debussy. While he does not shrink from daring harmonies, unresolved dissonances, and complicated rhythms, his themes are more pregnant and definite than those of most impressionists. His talent appears to best advantage in the finely wrought details of works in the smaller forms, especially in the compositions for piano. He wrote the operas, *L'Heure Espagnole* (Paris, 1911; Chicago, 1920) and *La Cloche Engloutie* (not yet produced); the ballets, *Daphnis et Chloë, La Mère l'Oye,* and *Adelaide ou le Langage des Fleurs* (all in Paris, 1912); an overture, *Shéhérazade; Rapsodie Espagnole;* a choregraphic poem, *La Valse;* a piano concerto on Basque themes; *Trois Poèmes* (Mallarmé) for voice, piano, two flutes, two clarinets, and string quartet; *Shéhérazade* for solo voice and orchestra; some chamber music; songs; and piano pieces, among which the *Valses Nobles et Sentimentales* are particularly fine.

RAWLINSON, HENRY SEYMOUR, first BARON (1864–1925). In 1917, at the outbreak of the War, he commanded the famous but ill-fated 7th Division in Belgium in pursuance of the scheme for holding back the Germans on the line of the Scheldt River. With the exception of a short time as a member of the Allied War Council, he remained in high command during the entire war. His chief exploit was in the great British offensive of 1918, when, with the 4th Army, he drove the Germans over the Hindenburg line and was thus instrumental in bringing about the collapse of their defense. He was raised to the peerage in 1919.

RAY, CHARLES (1891–). An American actor, born in Jacksonville, Ill. best known for his work in motion pictures. He began his career on the legitimate stage in small parts in stock and vaudeville. His first film was a Thomas Ince production. *The Coward, The Deserter, The Dividend, The Pinch Hitter,* and *The Clodhopper* were his best starring pieces up to 1920, when he incorporated his own company and produced George Cohan's *Forty-five Minutes From Broadway,* James Whitcomb Riley's *The Old Swimmin' Hole,* Charles Van Loan's *Scrap Iron,* Charles Hoyt's *A Midnight Bell,* and others.

RAY, GEORGE JOSEPH (1876–). An American civil engineer, born at Metamora, Ill., and educated at the University of Illinois. He entered the service of the Illinois Central Railroad as a roadman. By regular advancements he attained the place of division engineer, which he held until 1909, when he became chief en-

gineer of the Delaware, Lackawanna, and Western Railroad. His chief work for this railroad was the construction of the Hopatcong-Slateford cut-off; he also designed and built the Tunkhannock viaduct at Nicholson, Pa., the largest concrete bridge ever constructed up to that time. During the War he was engineering assistant to the regional director of the Eastern Region of the United States Railroad Administration but in 1920 returned to his former position.

REA, SAMUEL (1855–). American engineer and railroad president (see VOL. XIX). In 1917 the American Railway Association appointed him a member of the special commission on national defense of the Railroads War Board. He was also director of railroads under the authority of the Committee of Public Safety of Pennsylvania. He gave his yacht to the United States government for patrol duty in the Atlantic during the War.

READING. A city of Pennsylvania. The population rose from 96,071 in 1910 to 107,784 in 1920 and to 110,917 by estimate of the Bureau of the Census for 1923. Concrete viaducts were built over the Schuylkill River and the Pennsylvania Railroad tracks at Penn Street, and at Schuylkill Avenue and River Road, and a concrete bridge over the river at Bingaman Street. A city planning commission was appointed. Five million dollars was voted for a school building programme, and two junior high schools were built at a cost of $1,500,000. Additions were made to two hospitals and a third was being built, a Y. W. C. A. building was completed in 1921, and plans were ready for the erection of a museum and art gallery. The electric, gas, city water, sewer, and trolley systems were extended. The number of industrial establishments increased from 486 in 1914 with output valued at $53,232,000, to 501 in 1924 with output valued at $169,630,422.

READING, (RUFUS ISAACS), first EARL OF (1860–). An English jurist (see VOL. XIX), appointed in 1913 Lord Chief Justice of England. His knowledge of finance was of great service during the War, and he was sent to the United States on special missions, including those of High Commissioner and Special Ambassador. In 1920 he was appointed Viceroy of India.

RECLAMATION, LAND. Reclamation of land for agricultural use offers larger opportunity for increasing food production than any other single operation, since throughout the world there are large areas that can be made productive by some one of the processes embraced by this term.

World-wide figures for the areas susceptible of reclamation are not available. The *Year-Book of the United States Department of Agriculture* for 1921 gives the area of arid land susceptible of reclamation as 30,000,000 acres, and the area of wet land susceptible of drainage as 90,000,000, making a total of 120,000,000 acres, or an area equaling about 25 per cent of the area of improved land in the United States, or about 33 per cent of the present crop area in the United States To this can be added a considerable but not definitely known area of land now subject to overflow but capable of reclamation by dyking. Probably it is safe to say that the crop production of the United States can be increased at least one-third by land reclamation. In the absence of definite information, it seems probable that the same estimate may be applied safely to the world as a whole. For the United States, the Census of 1920 shows the area actually irrigated in 1919 to be 19,191,716 acres; the area in existing irrigation enterprises 35,890,811 acres; and the area drained in 1920 65,495,038 acres, of which 44,288,238 acres were reported as "improved" land according to the Census definition.

The United States, about 1850, granted the swamp lands then belonging to the Federal government to the States in which they were situated, in order that the States might provide for their reclamation. As a consequence the Federal government has not participated in swamp-land reclamation, otherwise than by this grant of land. In the case of irrigation reclamation, the United States government has helped to promote development, first by removing so far as possible the obstacles to development by non-governmental agencies, and later by government financing and construction. In 1902 the Reclamation Law was enacted. This set aside the receipts from the sale of public lands as a reclamation fund to be used in the construction of irrigation works, repaid by the water users, replaced in the fund, and used again. As reported by the Census of 1920, the acreage irrigated in 1919 by works built under this law was 1,254,569 acres, or about 6.5 per cent of the total area irrigated in that year. The amount expended under the law at that time was reported as $129,509,819, which is 18.6 per cent of the total investment in irrigation for the United States. Interest is not charged on deferred payments, but if added would make the actual cost to the government greater than that reported, the remission of interest being, in effect, a subsidy to land reclamation. Only a small part of the money invested in this work by the government has been repaid, but the receipts from other sources have been added to the reclamation fund, so that the amount available for the year 1923 was about $10,000,000. The failure of water users to repay construction costs led to the appointment of a commission to investigate and recommend changes in the law or its administration (1923–24). It was felt that the relations between the government and the water users should be governed by contracts that can and will be carried out, rather than continue under nominal obligations that are ignored Dr. Elwood Mead of California was appointed Commissioner of Reclamation early in 1924.

Drainage reclamation in the United States has taken place almost entirely under State laws for the creation of special improvement districts that have the power to issue bonds to obtain funds for construction, and to levy and collect assessments to meet payments of principal and interest on bonds and operating expenses. These districts are organized under public supervision, but otherwise receive no public aid. The States containing arid land have enacted similar laws for the organization of irrigation districts, and have, in most cases, attempted to aid in the sale of bonds by certifying such bonds as legal investments for public and trust funds, but they have not assumed any legal liability for the payment of bonds or interest, except in the case of Oregon, where the State pays the interest on the bonds of approved districts for periods of from two to five years. There have been many proposals for extending to drainage reclamation the system of Federal aid in irrigation. Several bills providing for

this were introduced in Congress, but up to 1924 none had been passed. On the other hand, there was a growing objection to further subsidy to land reclamation.

For many years in the United States the rate of expansion in the area of reclaimed land used for agriculture has been decreasing. The average annual increase in the area irrigated from 1900–10 was about 669,000 acres; while the average annual increase from 1910 to 1920 was but 476,000. Annual figures are available for the government projects only. On these the rate of increase had been falling off sharply, even during the boom years of the War, and the year 1922 showed an actual decrease in acreage as compared with 1921. The decreasing rate of expansion was due, to a large extent, to increased cost of water supply. The Census of 1890 showed an average cost of $7.95 per acre; that of 1900, $9.04; that of 1910, $15.85; and that of 1920, $26.81. These figures do not represent correctly the increase in cost; this is shown by averages based on increased total cost and increased total area, from one census to another. Averages based on such figures are as follows: 1890, $7.95; 1900, $10.05; 1910, $20.05; 1920, $65.60. Comparing these costs with that of 1890, the percentages of increase are 1900, 26.4 per cent; 1910, 152.2; 1920, 725.2. In the future, construction will be increasingly difficult and increasingly costly except for general changes in price levels.

Increased food supplies can be obtained in several ways other than by reclaiming lands largely unproductive. This increasing cost of reclamation will tend to force expansion into other lines. Nevertheless, the possibility of expansion by reclamation exists, and such expansion will take place as the pressure of population on food supply becomes more intense. In the United States the policy was to make reclamation self-supporting, except for the subsidy represented by relief from interest on deferred payments. Other countries very generally considered reclamation of sufficient importance to justify considerable public subsidies. Italy had provision for the payment of a part of the cost by the national government, a part by the provinces, a part by those who were to use the water. The British government, in India and Egypt, built and operated reclamation works without provision for direct repayment of cost, but secured its return through taxation of the products grown. In some cases it was expected that the taxes would pay interest on the cost, such projects being classed as "productive"; while in other cases such a return is not expected, and the projects are classed as "protective," or "famine" works. In either case, the water users were not under contract to pay any set amount for their water supply, but were to pay according to the products grown. In Australia, however, the state governments have carried on reclamation on the plan adopted in the United States, where the land reclaimed is expected to make a direct repayment of the cost, in addition to being subject to the same taxes as other farm land. Generally, this plan of financing has not been successful, and investors in reclamation enterprises operating on this basis, whether they were public or private, have lost heavily, while the eventual water users have acquired a water supply at less than cost.

RECLAMATION BUREAU, UNITED STATES. See DAMS.

RED CROSS, AMERICAN NATIONAL. The decade 1914–24 was the most important in the history of this volunteer reserve emergency organization, whose object was to relieve distress in times of peace and war. The most important functions were naturally those relating to war relief. At the outbreak of the War, the Red Cross had a registered enrollment of 5500 nurses and the necessary surgeons, besides an equipment for the purchase and transportation of supplies. This enabled it, during the latter part of 1914 and through 1915, to send to Europe surgical and sanitary units, each comprising three surgeons and 12 nurses, together with the necessary supplies, for war hospital work and the relief of noncombatants; it thus rendered greater continuous service than was ever given in a foreign war by any Red Cross of a neutral country. In addition to its services in the War, the Red Cross extended relief in 1915 to sufferers in Mexico, in Colon, Panama, and in Haiti. Relief was also furnished to sufferers from floods in Texas and Arkansas and from other emergencies in the United States. In 1916 the Red Cross remained devoted to European war relief, to some extent military, but chiefly civil. For this purpose it received during the year about $700,000. Important relief work was carried on in Serbia, Lithuania, Armenia, and Syria. The department of military relief in this year did most efficient service in the establishment of base hospitals and in rescuing wounded combatants. Important progress was made during the year in the organization of Red Cross units from the staffs of physicians and nurses in civil hospitals; 21 base hospitals were created for the United States Army, and four others were authorized. There was created on June 1, 1916, a national committee on Red Cross medical service, composed of 47 distinguished American physicians and surgeons. With the entrance of the United States into the War, increased concentration was required of all the forces of administration and relief; and the entire work was placed on a war basis. A central committee was formed in 1917, with William Howard Taft as chairman. Many important changes resulted. The most important of these was the appointment of a War Council of the Red Cross by President Wilson. Of this, Henry P. Davison, of J. P. Morgan and Company, was chairman. The result of the reorganization was to broaden the scope of the American National Red Cross so as to include the United States and the Allies. Work was from that time carried on in two important divisions: the service in America and that in Europe. Immediately after the organization of this council, a campaign was undertaken to raise $100,000,000 for the use of the organization. More than this amount was soon pledged. For relief work in foreign countries about $50,000,000 was appropriated; for work in the United States, about $3,000,000. The membership, which was about 5,000,000 at the beginning of 1917, increased to approximately 22,000,000 at the end of the year. By 1918 the work of the Red Cross had reached a high point of efficiency. In the United States, canteens and rest stations were established and maintained at 700 railroad and embarkation points, at a cost of nearly $8,000,000. Sanitary conditions around the camps were improved, and emergency supply hospitals were provided. Fifty base hospitals were organized, of which 49 were

sent to Europe; 45 ambulance companies, with 124 men each, were turned over to the army; over 32,000 nurses were enrolled, of whom over 20,000 were assigned to war duty with the army and navy; 10,000 were sent overseas. Sixty-three homes for convalescent soldiers were provided. During the year nearly $40,000,000 was spent in France alone, of which $15,000,000 was spent for relief of soldiers, and the remainder for civilian relief. Eight hospitals for American soldiers only were built, equipped, and operated, besides many others equipped and operated for French civilians. Hospitals were also built and maintained in England, Belgium, and Italy. In Serbia, 50,000 destitute persons were supplied with food, clothing, and medical supplies. The Red Cross was obliged to leave Russia when the Bolshevists obtained control. Much work was done by the Rumanian Commission following the defeat of the Rumanian Army in 1918. Nearly $4,000,000 was contributed to the American committee for Armenian and Syrian relief, and a commission was sent to Palestine with four medical units. Arrangements were made for the equipment of a hospital in that country. In addition to its war work, the Red Cross continued to give regular disaster relief work in the United States, China, Guatemala, and elsewhere.

With the conclusion of the War, great readjustments were necessary in the administration of the society. Various foreign commissions were successively closed out, and in May, 1919, a committee of liquidation began to make reducing readjustments, to sell off supplies no longer needed in relief operations. Late in 1919 there were still 1100 Red Cross workers in Europe. A programme formulated for work in the United States contemplated the establishment of health stations in communities without adequate facilities. The report of the War Council made in 1919 disclosed the following record of its activities. The contributions received in material and money amounted to $400,000,000; its members, including adults and children, 31,000,000; Red Cross workers, 8,100,000; tons of relief supplies shipped overseas, 101,000; foreign countries in which the Red Cross operated, 25; French hospitals given material aid, 3780; refugees aided in France, 1,726,000. There remained at the beginning of 1919 a balance of $127,000,000, of which $41,000,000 was in cash and $53,000,000 in supplies. Relief work continued to be carried on during the year in Albania, Belgium, Czecho-Slovakia, Germany, Italy, North Russia, Poland, Rumania, Serbia, and Siberia. The Red Cross took a leading part in the formation of the League of Red Cross Societies, which with headquarters at Geneva and with the National Red Cross organizations of the United States, Great Britain, France, Italy, and Japan as founder members, began in 1919 a world-wide fight for the prevention of disease and the promotion of health. The work of the Red Cross in 1920 was devoted chiefly to two major undertakings, the complete fulfillment of its obligations to the veterans of American participation in the Great War and to their families, and to completion, as far as possible, of relief work among the war-exhausted peoples overseas. To the men still in the army the organization continued to furnish recreation and assistance. At the end of the fiscal year, 1920, there were 7,000,000 instances in which help had been extended to men or to their families involving the expenditure of $20,000,000. Foreign relief work was carried on during 1920 in practically all the countries in which it operated in 1919, but by the end of the year, operations were confined to Poland, Serbia, Montenegro, Albania, Turkey, and southern Russia. Its most extensive work was carried on in Poland, where it did efficient work in the fight against typhus. In western Europe and the Baltic states, the distress of over 300,000 civilian poor was relieved. During the year the total expenditure for relief was about $70,000,000. During 1921 there was a marked expansion in peace-time activities at home and a contraction in foreign fields. There was a reduction of the operating divisions from 14 to 9. Extensive and varied assistance was given to American veterans of the War There was increased activity in public health and nursing service, and effective disaster relief was furnished at home and abroad. In foreign countries, there was a concentration of effort on child welfare work, chiefly medical in character. During the year about $25,000,000 was expended. Foreign relief work was carried on in Austria, South Russia, Constantinople, Poland, Italy, Greece, and other countries. In China, the Red Cross spent $1,200,000 for relief of famine sufferers, and it was estimated that more than 600,000 people were thus saved from starvation. In the United States, service was rendered to more than 25,000 disabled war veterans. In 1922 about $12,500,000 was expended. Of this, approximately $2,600,000 was for assistance to disabled ex-service men and women; $1,200,000 for medical and hospital supplies for distribution by the American Relief Administration in Russia; $2,000,000 for the completion of the child health programme in Europe, and $2,000,000 for the completion and liquidation of general relief operations abroad. During the year assistance was given in 72 disasters, including floods, fires, epidemics, and railway collisions. Work was carried on in seven foreign countries. The outstanding emergency operation of 1923 was the relief work for nearly 900,000 refugees in Greece, comprising those who had been driven out of Asia Minor. This work was closed on June 30, 1923. The total amount expended was over $2,500,000. The Red Cross took a most important part in contributing relief to the Japanese earthquake sufferers, in September, 1923. Within two weeks, over $5,000,000 was contributed, and 10 shiploads of supplies were forwarded to Japan. Foreign operations included also work for Russian refugees in and around Constantinople and refugees from Siberia, continued aid to the American Relief Administration to Russia, and aid to earthquake sufferers in Chile and Persia. Work for ex-service men continued on a large scale during the year The total expenditures for the fiscal year amounted tc $9,738,448. Special attention was given in 1923 to work in widely scattered rural communities. The American Junior Red Cross, composed chiefly of pupils in schools, brought in nearly 5,000,000 members in 1923. The membership of the adult organization was approximately 3,600,000. Following the death of President Harding, President Coolidge was elected president of the organization.

REDFIELD, Edward Willis (1869–). An American painter (see Vol. XIX). He won the gold medal of the Carnegie Institute in 1914, was on the jury of awards of the Panama-

Pacific Exposition in 1915, and won the first prize of the Wilmington (Del.) Society of Fine Arts in 1916, the Carnegie prize from the National Academy of Design in 1918 and 1922, the Altman prize from the National Academy of Design in 1919, and the Stotesbury prize from the Pennsylvania Academy of Fine Arts in 1920. One of his latest pictures, "Sycamore Hill," was in Carnegie Institute.

REED, JAMES A. (1861–). An American legislator (see VOL. XIX), United States Senator from Missouri. He was first elected for the term beginning Mar. 4, 1911, and was re-elected in 1916 and again in 1922. He opposed in the Senate many of President Wilson's policies, including the League of Nations and the Versailles Treaty, and Wilson in effect repudiated him as a member of the party. He was a candidate for the Democratic nomination for the presidency in the early part of 1924 but withdrew following his defeat in the Missouri primaries in March.

REED COLLEGE. A coeducational institution of higher learning at Portland, Ore., founded in 1911. The enrollment increased from 280 in 1916 to 321 in 1923, the faculty during the same period from 21 to 32 members and the library from 12,000 to 25,834 volumes. Various changes were made in the requirements for admission, and the curriculum of the freshman and sophomore years was reorganized in 1921. The Anna Mann cottage for women was built in 1920 and the Commons-Union was completed in 1923. William Trufant Foster resigned from the presidency in 1919, and was succeeded by Richard Frederick Scholz.

REESE, ALBERT MOORE (1872–). An American zoölogist, born at Lake Roland, Md., and educated at the Johns Hopkins University. He was professor of biology at Allegheny College (1901–02); instructor (1902–03) and associate professor (1903–07) at Syracuse University; and professor of zoölogy (1907–) at the University of West Virginia. He published numerous papers on the habits and embryology of the American alligator and *Introduction to Vertebrate Embryology* (1910), *The Alligator and its Allies* (1915), *Outline of Economic Zoölogy* (1919), and *Wanderings in the Orient* (1919).

REEVES, IRA LOUIS (1872–). An American educator, born at Jefferson City, Mo. He studied at Purdue University in 1892. From 1891 to 1902 he served in the United States Army, and was retired with the rank of captain on account of wounds received in action in the Philippines. He was professor of military science at Purdue University and the University of Vermont until 1915, when he was appointed president of Norwich University. During the War he served on the Mexican border and in France and rose to the rank of colonel and adjutant-general. He served as a member of the War Claims and War Credits Board in Washington in 1919, and then became president of the Reeves Engineering Company of Tulsa, Okla. He wrote *Bamboo Tales* (1901); *A B C of Rifle, Revolver, and Pistol Shooting,* and *Military Education in the United States.*

REFLEX. See ACTION; ANIMAL PSYCHOLOGY.

REFORMED EPISCOPAL CHURCH. Intense discussion in the Protestant Episcopal Church in 1873 culminated in the withdrawal of many clergymen and laymen under the leadership of Bishop David Cummins, and the organization of the Reformed Episcopal Church. In polity and doctrine it accords with the Protestant Episcopal Church, except that it looks upon the episcopacy as an ancient and desirable form of church government, rather than as of divine right, denies that Christian ministers are "priests," does not demand the re-ordination of clergymen of other denominations who enter its ranks, does not organize its bishops in a separate house in the General Convention, and denies baptismal regeneration. The membership of the denomination increased by 27.5 per cent, from 10,800 in 1913 to 13,750 in 1922, the number of churches from 80 to 81, and the number of Sunday school pupils from 9496 in 1918 to 10,075 in 1922. The number of ministers decreased from 83 to 81. Home mission work was carried on throughout the period among the Negroes of the South; foreign mission work in India comprised eight stations with six missionaries and 20 native helpers, 17 primary schools, two hospitals and one orphanage. The denomination supported a theological seminary at Philadelphia.

REID, E. EMMET (1872–). An American chemist, born at Fincastle, Va., and educated at Richmond College and at Johns Hopkins. During 1898–1901 he was professor of chemistry at the College of Charleston, S. C., after which he filled a similar chair at Baylor University, and then during 1908–11 he was again at Johns Hopkins, for research work. In 1911 he became research chemist for Colgate and Company but in 1914 accepted a call to return as associate professor of chemistry to Johns Hopkins, where in 1916 he became professor of organic chemistry. During the War he was associated in gas warfare investigations under the Bureau of Mines His original investigations were almost entirely confined to organic chemistry and relate to such subjects as hydrolysis and alcoholysis of acid amines; thio acids and alcohols and their esterification; organic sulphur compounds; and organic catalysis. Besides many papers contributed to the *American Chemical Journal* and similar publications, he published a translation of Sabatier's *Catalysis in Organic Chemistry* (1921).

REIMS. See WAR IN EUROPE, *Western Front.*

REINER, FRITZ (1888–). A Hungarian conductor, born at Budapest. He studied under Thomann and Kössler at the Landesmusikakademie there and in 1900 became conductor at the Comic Opera. In 1910 he was first conductor at the Landestheater in Laibach and in the following year at the Volksoper in Budapest. His appointment as principal conductor at the Hofoper in Dresden, as Schuch's successor (1914), offered him the opportunity for the full development of his exceptional powers, so that in a short time he was in great demand as a guest conductor and appeared also in Spain and Italy. In 1922 he became Ysaÿe's successor as conductor of the Cincinnati Symphony Orchestra.

REINHARDT, MAX (1873–). A German theatrical director and manager (see VOL. XIX). In 1919 he founded the Grosses Schauspielhaus, a theatre as large as the New York Hippodrome, specializing in impressionistic mass effects. As a master of the new stagecraft Reinhardt toured the United States in 1923. He presented *The Miracle*, one of the largest theatrical pageant-spectacles ever produced, in New York City under Morris Gest's management

REISS, ALBERT (1870–). A German dramatic tenor, born in Berlin. He had begun a successful career as an actor when Pollini discovered his voice and persuaded him to study for the operatic stage. He made his début in Lortzing's *Zar und Zimmermann* at the Stadttheater in Königsberg (1897). He then sang at Posen, Wiesbaden, and Munich In 1901–17 he was a member of the Metropolitan Opera Company, with which he became specially identified with the rôles of David (*Meistersinger*) and Mime (*Siegfried*). He also created there the principal tenor parts in the world premières of Puccini's *Fanciulla del West* (1910), Humperdinck's *Konigskinder* (1910), Parker's *Mona* (1912), Damrosch's *Cyrano de Bergerac* (1913), De Koven's *Canterbury Pilgrims* (1917), and in the American première of Smetana's *Bartered Bride* (1909). In 1916 he organized the Society of American Singers for the purpose of producing in English the more intimate operas which lose much of their effectiveness in a large auditorium. He staged the American première of Mozart's *Schauspieldirektor* (October 26) during its first season in New York; in the following year Pergolesi's *La Serva Padrona* (May 7), Donizetti's *Il Campanello di Notte* (May 7), and Gounod's *Le Docteur Miracle* (May 10) had their American premières. He resigned in 1918 and was succeeded by William Hinshaw (q.v.).

RELIEF ADMINISTRATION, AMERICAN. An organization built up by Herbert Hoover shortly after the Armistice as an agency to administer American relief and assistance to countries in Europe devastated and impoverished by the War. An Act of Congress, approved Feb. 24, 1919, appropriated $100,000,000 for European relief to be used "as a revolving fund until June 30, 1919"; and President Wilson by Executive Order (Feb. 24, 1919) placed all matters pertaining to the furnishing, transportation, distribution and administration of supplies under this Act under the direction of Hoover as director general of the American Relief Administration. In this capacity, as director general of relief for the Allies and as member of the Supreme Economic Council, Hoover coördinated the inter-Allied efforts for relief and economic reconstruction. The object of the A.R.A. was to assist new states and governments exhausted by war to help themselves. Food valued approximately at $400,000,000 was supplied to these countries for gold or negotiable securities. For additional supplies which were necessary, but for which the governments concerned were unable at the time to pay cash, the American government accepted obligations amounting to some $300,000,000. A further $30,000,000 was spent by the A.R.A. during this period for the relief of waif and undernourished children. The general relief operation under the Congressional appropriation was completed in the autumn of 1919, but the care of children in the Baltic and central European states was continued by the A.R.A. Relief measures for the year 1919–20, organized by Hoover and administered by the A.R.A., amounted to more than $100,000,000, of which about $50,000,000 came from Congress. American supplies began to reach Europe in great quantities early in 1919 and were distributed by representatives of the A.R.A. in Finland, Esthonia, Latvia, Russia, Lithuania, Poland, Danzig, Germany, Czecho-Slovakia, Austria, Hungary, Rumania, Jugo-Slavia, Armenia, Georgia, and Bulgaria. The A.R.A. not only delivered food to these countries but contributed to their rehabilitation through the control of shipping, railways, and mines in eastern Europe, the Peace Conference having made Hoover the mandatory in these economic activities in the territories of the former Austro-Hungarian Empire. Supplementing the general relief programme was a programme of child relief, in liberated and enemy countries, carried out under the A.R.A. European Children's Fund. The A.R.A. also coöperated in the campaigns against typhus in Poland and Rumania and established a money exchange system to facilitate the sending of aid from residents in America to relatives and friends in Europe from whom they had been cut off during the War. An adjunct of these operations was the food draft system, by which persons in America and elsewhere could buy drafts in favor of designated persons in central Europe to whom the A.R.A. delivered a specified amount of food. This arrangement afforded a vast amount of direct relief that otherwise would have been unavailable. Members of the A.R.A. contributed to reconstruction by serving as technical advisers to the new governments In 1920, under Hoover's leadership, the A.R.A. joined with other American relief agencies in a national appeal for funds for the support of European children; this resulted in the collection of $29,000,000. The A.R.A., continuing its child-feeding operations in the Baltic and central European states, reached 3,500,000 children in the year 1920–21. In addition to the children's kitchens and the food drafts, the A.R.A. delivered large quantities of clothing to the needy and administered specially contributed funds for the relief of students, teachers, doctors, and other members of the professional and salaried classes, whose suffering was particularly acute because of economic conditions. On its withdrawal from these countries in 1921–22 the A.R.A. left in operation efficient child welfare organizations established in the course of its work. In 1921 the A.R.A. answered the appeal of the Russian Soviet government to give aid in the famine, which, as a result of the drought and the economic demoralization of the country, threatened to bring death to millions through starvation or disease. On the basis of an agreement with the Soviet government, made at Riga, Aug. 20, 1921, the A.R.A. began with a programme for 1,000,000 children, which it rapidly expanded as funds became available until it reached its peak in August, 1922, when nearly 11,000,000 children and adults were receiving a daily ration from the A.R.A. Side by side with the feeding operations, the A.R.A. conducted a food and clothing remittance system, similar to the food drafts

for central Europe; it carried out a vast medical relief programme, which included the rehabilitation of 15,000 hospitals and institutions, the vaccination and inoculation of 7,000,000 persons, and a general campaign of sanitation in the principal cities and towns of Russia The A.R.A. in Russia, which operated some 20,000 feeding stations, consisted of an American staff of 200 with a Russian organization of 120,000 workers. The funds for the Russian relief totaled approximately $65,000,000, of which $24,000,000 came from an appropriation by the United States Congress, $12,000 000 from the Russian Soviet government, $3,600,000 from the American Red Cross, $4,000,000 from the Jewish Joint Distribution Committee, and the remainder from gifts made directly to the A.R.A. or to other relief organizations coöperating in this enterprise. The arrival of American supplies in Russia checked the famine in the early summer of 1922, and by the autumn of that year the food situation had sufficiently improved to permit the discontinuance of adult relief. The A.R.A. continued, however, during the following winter, spring, and summer, to care for Russian children and to deliver medical relief. New funds permitted a special programme of aid to teachers in the secondary schools and other institutions; this saved many lives and kept open a great number of schools. Withdrawing from Russia in July, 1923, the A.R.A. left supplies sufficient for the continuance of its programme until the harvest of that year. All European offices of the American Relief Administration were closed and all personnel withdrawn in the autumn of 1923 The totals of supplies handled from all quarters exceeded $1,000,000,000; relief was provided, one time or another, to more than 200,000,000 persons, besides direct service to more than 11,000,000 orphan and destitute children.

Officers of the American Relief Administration at the end of its European operations were: Herbert Hoover, chairman; Julius H. Barnes, vice chairman; Edgar Rickard, director general; Edward M. Flesh, comptroller; Gates W. McGarrah, treasurer; George Barr Baker, director of State organizations; Walter Lyman Brown, director for Europe; Col. William N. Haskell, director in Russia

RELIEF IN BELGIUM, COMMISSION FOR. See BELGIUM.

RELIGION, PRIMITIVE. See ETHNOLOGY.

RELIGIOUS CONTROVERSIES. The decade 1914–24, especially in its later years following the War, was marked by a remarkable revival of religious controversies in several of the larger Protestant denominations. Those chiefly affected were the Baptist, Methodist, Presbyterian, and Protestant Episcopal. In the main, these dissensions centred about the old differences between liberal and conservative interpretations of the Scriptures and creeds. They correspond to a large extent to the struggle against Modernism which for many years was carried on in the Roman Catholic Church. In connection with them there emerged a new term, Fundamentalism. Although this was applied especially to the controversy between the Liberal and Conservative elements in the Baptist denomination, it also described essentially the character of the disagreements in the other denominations. Fundamentalism is defined by one of its adherents as "merely an uprising of orthodox supernaturalism against modern naturalism." Those opposed to Fundamentalism describe it as a movement among ultraconservatives to keep religion in the bonds of supernaturalism.

It is generally admitted that the conditions which followed the War were largely responsible for the revival and development of this struggle between the liberal and conservative wings. Fundamentalism, however, is more than a reaction. It is the culminating point of a tendency which has been gathering strength for at least 30 years. The controversy in its widest sense turns on the view held in regard to the Scriptures. The Fundamentalists or conservatives assume an inerrant Bible, literally inspired and authoritative throughout, and they view as inimical to Christian doctrines any theory or interpretation which contradicts the literal interpretation of the Scriptures. Thus they come into conflict with the doctrine of evolution or Darwinism, and strong attacks were delivered, not only in the pulpit, but in the schools, against the teaching of the theory of evolution. Indeed, in several States in 1922 and 1923, the Legislatures adopted resolutions prohibiting the teaching of evolution in the school systems. Among the most ardent opponents of the evolution theory was W. J Bryan, who devoted much of his time to attacking the doctrine on the platform and elsewhere

In the Baptist denomination, where the controversy was especially fierce, it was estimated by Dr. Shailer Mathews of the University of Chicago in 1923 that the Fundamentalists in that year controlled about one-fourth of the evangelical churches in the East, about half the evangelical churches in the Middle West and South, and about three-fourths of the evangelical churches in the Far West. The Fundamentalists themselves claimed in that year to control nine-tenths of the laity of the churches. In the Presbyterian denomination the struggle took on great intensity from 1922 to 1924. *The Presbyterian*, an important church organ, declared that "Rationalism and Evangelicism are antagonists that can never be reconciled; it is vain to try to plaster up a union between them." Professor Machen of the Princeton Theological Seminary stated that "modern Liberalism is not only a different religion from Christianity but belongs to a totally different group of religions." In New York City a particularly bitter controversy arose over the preaching of Dr. Harry Emerson Fosdick, a Baptist clergyman, at the First Presbyterian Church. He was one of the chief advocates of Liberalism, and efforts were made at various times to prevent his occupying a Presbyterian pulpit.

In the Protestant Episcopal Church the controversy turned on the interpretation of certain doctrines, especially the virgin birth and the bodily resurrection of Christ. In November, 1923, at a special session of the bishops of the church held in Dallas, Texas, a pastoral letter was drafted in which the declaration was made that to deny or to suggest errors as to the facts stated in the Apostles' Creed was irreconcilable with oaths taken by ministers of the church, and that objections to the virgin birth and the bodily resurrection are contrary to the best traditions and that these doctrines are abundantly proved by scholarship. This letter was appointed to be read in all the churches. It at once aroused opposition and hostility among the advocates of liberalism. Dr. Leighton Parks, rector of St.

Bartholomew's Church in New York City, after reading the letter in compliance with the direction of the bishops, removed his robes and attacked their action as cowardly and unjustified. Bishop Lawrence of Massachusetts also strongly dissented, and so did other prominent clergymen throughout the country. The Rev. Lee W. Heaton, rector of a church in Fort Worth, Texas, who denied the virgin birth and other doctrines, was threatened with trial for heresy.

One of the most notable controversies was that between Bishop Manning of New York and Dr. Percy Stickney Grant, rector of the Church of the Ascension. Dr. Grant had for many years preached Liberalism and had several times been reproved by the bishop, not only for his preaching such doctrines, but for the maintenance of a so-called Forum in his church, in which opportunity was given persons of all beliefs and theories to explain and advocate their causes. Dr. Grant, early in 1924, specifically affirmed his disbelief in the virgin birth and other doctrines. For this he was called to account by Bishop Manning, and letters were exchanged between them. Later he resigned on the ground of ill health.

At the annual conventions of the various denominations held in 1924, Fundamentalism as against Liberalism was an issue. At the Northern Baptists' Convention held in Milwaukee in June, the Fundamentalists were well in control. At the annual assembly of the Presbyterian Church of the United States at Grand Rapids in the same month, the Fundamentalists were in the majority and elected W. J Bryan vice moderator Dr William P. Merrill, pastor of the Brick Presbyterian Church in New York City, one of the leading Liberal clergymen, was removed from the Foreign Missions Board. Dr. Fosdick was requested to join the Presbyterian Church "if he can adopt the doctrinal standards of our church as contained in the Westminster Confession." The Liberals, however, gained a victory in defeating a proposal to pass five points of doctrine which would have bound all Presbyterian clergymen to literal interpretation of certain Bible passages. At the Quadrennial Conference of the Methodist Episcopal Church, held in Springfield, Mass., in May, 1924, an attempt to pass a so-called Declaration of Faith presented by Fundamentalists was defeated Fundamentalism, however, was approved by the delegates. In the opinion of many leaders on both sides, the controversy was likely to lead to the formation of a new denomination in which members of older denominations who advocate liberal beliefs and freedom from literal interpretation of the Scriptures will be obliged to take refuge.

RELIGIOUS DENOMINATIONS. See articles on the respective denominations.

REMINGTON, WILLIAM PROCTOR (1879–). An American bishop, born at Philadelphia, and educated at the University of Pennsylvania and the Theological Seminary of Virginia He was ordained to the priesthood in the following year and was a curate and rector of several churches in Philadelphia until 1911, when he became rector of St. Paul's Church, Minneapolis, Minn. In 1918 he was consecrated suffragan bishop of South Dakota and served as chaplain in the War. He was an official and trustee of several church societies.

RENSSELAER POLYTECHNIC INSTITUTE. A school of engineering and science, at Troy, N. Y., established in 1824, offering graduate and undergraduate courses in civil, mechanical, electrical and chemical engineering and in general science. The institute expanded during the decade between 1914 and 1923–24 both in numbers and equipment. The registration in 1923–24 was 1140, compared with 640 in 1914; the faculty numbered 94 as compared with 63 in the earlier year; and the productive funds increased from $1,350,000 to $2,850,000. In 1922, a great radio broadcasting station was established which claimed the record for long distance, transmission from it having been heard for a distance of 10,000 miles. A gauging station to be used by the students under the direction of the United States Geological Survey was established in 1923. During the 10 years the number of endowed scholarships carrying free tuition was increased by four, and 10 new fellowships for graduate students, each of a value of $750 a year, were created. In 1914, the total property of the school was valued at $2,850,000 and in 1924 the value was more than $6,000,000. President, Palmer C. Ricketts, E.D., LL.D.

RENT LAWS. See LAW, PROGRESS OF THE; HOUSING

REORGANIZED CHURCH OF JESUS CHRIST OF LATTER DAY SAINTS. This is the smaller of the two bodies known as Latter Day Saints, bearing the distinctive term "Reorganized" as part of its church title. It was founded in Wisconsin in 1852 in succession to the original Church of Jesus Christ of Latter Day Saints established at Fayette, New York in 1830 by Joseph Smith. The Reorganized Church is identical in faith and principles with the original church, but, unlike the other organization, has always repudiated plural marriage. Its membership increased from 73,899 in 1915 to 95,365 in 1923; the number of ministers increased to 6136; and the number of Sunday Schools from 637 to 875, and pupils from 33,062 to 60,376. The denomination maintains Graceland College at Lamoni, Iowa, and the Independence Institute of Arts and Science at Independence, Mo., and publishes several periodicals.

REPARATIONS. The subject of reparation by Germany and her confederates for damages done to the Allied countries during the War constituted one of the most difficult and complicated of the multifarious problems considered at the Peace Conference of Paris in 1919. Only tentatively and unsatisfactorily dealt with at that time, it subsequently remained the key factor in the economic rehabilitation of Europe and a perennially potent menace to international peace and security. Inveterate international practice had consecrated the right of the victor to recover, if possible, the costs of war from his defeated enemy; the classic example of an indemnity was the $1,000,000,000 penalty imposed by the German allies on France at the conclusion of the Franco-Prussian War (1870–71). *Vae victis!* The first formal though secret reference known to have been made to this subject by the Allied governments during the War was in the Treaty of London (Apr. 23, 1915), which promised Italy, besides many other things, "a share of the war indemnity." In their pronouncement of Dec. 30, 1916, the Allied governments asserted: "The disasters caused by the German declaration of war and the innumerable outrages committed by Germany and her allies against both belligerents

and neutrals, demand penalties, reparation, and guarantees" In their note to President Wilson, Jan. 10, 1917, they explained that their war-aims, "with all the compensation and equitable indemnities for harm suffered," would only be set out in detail when the time came for actual negotiations, although they avowedly included "necessarily and first of all, the restoration of Belgium, Serbia, and Montenegro, with the compensation due to them," and the "evacuation of the invaded territories in France, in Russia, and in Rumania, with just reparation." In his war-aims address of Jan. 5, 1918, Lloyd George reiterated these objects, declaring that the British government and the Allies demanded the "complete restoration . . . of the independence of Belgium and such reparations as can be made for the devastation of its towns and provinces. This is no demand for war indemnity as was imposed on France by Germany in 1871. *It is not an attempt to shift the cost of warlike operations from one belligerent to another*, which may or may not be defensible. . . . Next comes the restoration of Serbia, Montenegro, and the occupied parts of France, Italy, and Rumania. . . . Finally there must be reparation for injuries done in violation of international laws"

This clear-cut pronouncement, so remarkable in the light of the speaker's subsequent vagaries, promptly elicited (January 6) a telegram from Premier Clemenceau congratulating him for having so felicitously summarized "the actual truths." The same specific aims were later incorporated by President Wilson in his famous "Fourteen Points" address of Jan. 8, 1918 (Points 7, 8, and 11). The President, however, made no reference to indemnities for war costs, and his conception of reparations for damage done, as therein expressed, was distinctly limited in scope. Indeed, in his "Four Principles" address of Feb. 11, 1918, Wilson categorically asserted: "*There shall be no annexations, no contributions, no punitive damages.*" On Dec. 4, 1917, he had explained to Congress that "the wrongs, the very deep wrongs, committed in this war, will have to be righted. . . . But they cannot and must not be righted by the commission of similar wrongs against Germany and her allies" This principle and purpose he reiterated on Sept 27, 1918, in the much-quoted sentence that "the impartial justice meted out must involve no discrimination between those to whom we wish to be just and those to whom we do not wish to be just." The Armistice terminating the War was avowedly predicated on the acceptance both by the Entente Powers and by Germany of the principles enunciated by Wilson in his successive addresses of 1918. The Peace Conference was to discuss the practical details of their application. To be sure, one of the reservations made by the Supreme Council (Nov 4, 1918) was to the effect that provision for the evacuation and restoration of all invaded territories expressly implied that compensation would be made by Germany "for all damage due to the civilian population of the Allies and their property by the aggression of Germany by land, by sea, and from the air," but the exact force and extent of the obligations created by these conversations were rendered lamentably obscure by a qualifying clause in Article 19 of the Armistice Convention itself, stipulating that subsequent financial concessions and claims by the Allies and the United States should remain unaffected. Around the interpretation of these conditions a diplomatic and legal battle was destined to rage.

With the emotional reaction of the post-Armistice period came a significant realignment of facts and forces. As the extent of Germany's collapse came to be known, greater demands were made for her condign punishment. In the parliamentary election of Dec. 14, 1918, in Great Britain, Lloyd George's coalition government catered to the popular demand for a retributive peace by promising to recover the whole cost of the War, "shilling for shilling" and "ton for ton." Lord Cunliffe, ex-Governor of the Bank of England, estimated Germany's liability to pay as aggregating the stupendous sum of $100,000,000,000, a total which the Premier shortly afterward augmented to $120,000,000,000. In France, the Clemenceau cabinet and the overwhelming majority of the French people were formulating equally extreme demands. The imposition of taxes was postponed in response to popular claims, and by skillful propaganda the masses were convinced that Germany could, should, and would be made to pay the full costs of the War. On Jan. 25, 1919, at the second plenary session of the Peace Conference, a commission was appointed to examine and report, first, on the amount which the enemy countries ought to pay by way of reparation; secondly, on what they were capable of paying; and thirdly, on the method, form, and time in which payment should be made Two main controversies marked the discussions of the ensuing months: (1) that over permissible categories of damage; and (2) that over Germany's real or alleged capacity to pay. Of the 31 categories suggested to the Commission, 10 were ultimately incorporated in the Treaty of Versailles. It was universally agreed that direct damage to persons or property should be compensated, and certain other claims occassioned little conflict, but not so with war-costs.

Mr. Hughes and Lord Sumner of the British delegation bluntly argued that since ultimately all war costs had to be met by general taxation, they constituted damage done to civilian populations in the Allied countries and might therefore be legitimately included in the reparations bill This view received the keen support of the French, whose interest in reparations was subordinate only to their primary consideration of security. (See PEACE CONFERENCE AND TREATIES.) So fearful were they of a German revival, so completely exasperated and antagonized by the systematic and intentional destruction of their industrial regions, that they proved even more anxious than the British to cripple Germany economically. Consequently they favored assessing the entire cost of the War on the vanquished foe despite the fact that although the absolute amount of their claim might be substantially increased thereby, their relative share in the total receipts would nevertheless be greatly diminished. The Belgians, anxious for complete indemnification and priority of payment, expressed serious concern lest the extension of Allied claims far beyond the finite capacity of Germany to pay would eventually deprive Belgium of her due. The Americans, renouncing any claims for themselves, attacked the inclusion of war-costs as violating pre-Armistice pledges. The dispute was referred to the Supreme Council on March 1, and the refusal of the American experts to accede to the British and French demand was

subsequently upheld by President Wilson, who denounced the course contemplated and declared that he would "dissent publicly, if necessary, not on the ground of the intrinsic injustice of it, but on the ground that it is clearly inconsistent with what we deliberately led the enemy to expect and cannot now honorably alter simply because we have the power."

This rejection of their original demand impelled the British and French to insist on the inclusion of pensions and separation allowances, which would serve the purpose not only of making the total payment to be demanded of Germany relatively enormous, but also of appeasing the British demand for a more equitable remuneration than the Empire would receive on the basis of reparations for damages alone The Americans vigorously combated this new proposal, which in some measure vitiated their victory in the war-costs controversy; but the necessity for compromise following the bitter crisis with the French in early April (see PEACE CONFERENCE AND TREATIES) in combination with some rather illogical and sentimental arguments advanced (Mar. 31, 1919) by "the ordinarily liberal-minded" General Smuts of South Africa finally convinced Wilson of the advisability of including pensions and reparations allowances, thereby more than doubling the reparations bill. The German delegation in its Comments on the Conditions of Peace, of May 29, 1919, expressed complete inability to recognize these claims as having "a legal title, as they apply to direct war-costs and not to damages done to the civilian population by an act of war"; and in this contention impartial legal opinion must sustain them.

Equally keen was the struggle waged from January to June over the question of Germany's capacity to pay. The French proposals were fantastic, the most extreme calling for a total of $200,000,000,000 to be collected in some 50 annual installments. British suggestions ranged from the Lloyd George-Cunliffe estimate of $120,000,000,000 to the Liberal Keynes's approximate $10,000,000,000 The Americans, vitally interested in the speedy reëstablishment of normal economic relations, labored indefatigably for the stipulation of a definite and moderate total sum, for they were of the opinion that any reasonable though arbitrary fixation would be greatly preferable to the uncertainty and consequent disorganization of Germany's credit sure to result from postponement, and they argued that France, the greatest creditor of Germany, "would benefit most by taking everything that she possibly could, by taking it quickly and writing off the balance." Their extreme proposal was for a capital sum of $58,000,000,000 to be paid in 30 years, but the basic figure which they later consistently advocated was a total of $25,000,000,000. Both the British and French premiers feared to accept the moderate proposals of the Americans because they fell so far below the expectations of their respective peoples Indeed at one juncture the seeming acquiescence of Lloyd George in plans for a reasonable settlement evoked a telegram from 370 members of the newly-elected "khaki" Parliament, warning him that they expected the fulfillment of his electoral pledges. Had the Americans offered to cancel outright or to abate appreciably the enormous indebtedness of the Allies to the United States as the "essential American contribution toward a new coöperative plan for restoring Europe and the world," they would *ipso facto* have enjoyed a "powerful trading weapon in securing the settlements they desired." This, however, they consistently refused to do, asseverating that these debts "had nothing to do with reparations or rehabilitation." A special committee of liberal-minded experts, British, French, and American, appointed in March to investigate the matter, concluded that "Germany might possibly pay from $10,000,000,000 to $20,000,000,000 over a period of 20 to 30 years." This sound conclusion was wholly unacceptable to the more conservative advisers and plenipotentiaries The committee then sought to attain the definition of a flexible sum, "adjustable as to amount and means of payment, within certain maximum and minimum limits." For the execution of this scheme they proposed a Reparation Commission endowed with rather large powers and capable of becoming an instrument of "wisdom and justice." The French, seeing a chance to postpone the fixing of a definite sum of reparations and thereby to keep Germany uncertain and to avoid domestic disillusion, jumped at the suggestion and advocated a commission, but one empowered to register the claims of the various countries under the different legitimate categories and to settle the figure of the annuities and the period of payment "The only consideration given to Germany's capacity to make payments would be in the form of lengthening the period given her to complete them—which, by the accumulation of interest on the unpaid portion, might be extended to infinity. It practically amounted to a perpetual economic control of Germany by an Allied Commission."

The whole question came to a crisis late in March. President Wilson and his advisers fought the French proposition bitterly. Lloyd George, guided by the dictates of expediency alone, agreed now with one side, then with the other. Unfortunately the definitive decision was made by the Council of Four during President Wilson's illness. His colleague Colonel House, representing the United States, in a too conciliatory spirit yielded to the threats and importunities of Clemenceau (Apr. 7, 1919). The problem of reparations affected not merely Germany, but the other Central Powers as well. In their respective treaties Germany, Austria, and Hungary accepted the responsibility for causing "all the loss and damage" to which the Allied and Associated Powers were subjected; and they were made jointly and severally liable for the whole amount. Bulgaria, on the other hand, was obliged to acknowledge that she had "caused losses and sacrifices of all kinds for which she ought to make complete reparation"; in other words, to assume separate responsibility for certain damages. On the Allies' side arrangements for dividing the receipts were necessary. At the Peace Conference after a protracted struggle between the French and the Italians, the general principle was adopted that each Allied state was to share jointly with the other Allies in damage payments by any enemy nation for "all operations of war by the two groups of belligerents wherever arising." Belgium received special consideration. In addition to promised reimbursement for all her war-costs, a just decision in view of her violated neutrality, she demanded priority of payment. Her representatives urged their most sweeping demands during the French crisis in early April

and again during the period of threatened disruption over the Italian and Japanese settlements in late April. Lloyd George vehemently opposed granting any concessions to the Belgians, but largely owing to American support and the eventual winning of French consent they were accorded a priority of $500,000,000 in addition to compensation for the entire war costs.

In addition to protesting against the inclusion of pensions and separation allowances, the German delegation in its comments on the conditions of peace (May 29, 1919) further sought an immediate and definite fixation of their liability; they offered, subject to the modification of certain economic terms, to make periodic payments in the form of annuities commencing in 1927 and amounting to 100,000,000,000 gold marks, a sum whose approximate 1919 capital value amounted to 40,000,000,000 gold marks. Lloyd George made a short-lived and half-hearted attempt to moderate the reparations burden, but it was eventually decided to reject the German proposition outright.

The Treaty of Versailles (June 28, 1919) attempted to settle the question of German liability by distinguishing between moral responsibility and material compensation. "The Allied and Associated governments," according to Article 231, "affirm, and Germany accepts, the responsibility of Germany and her allies for causing all the loss and damage to which the Allied and Associated governments and their nationals have been subjected as a consequence of the war imposed on them by the aggression of Germany and her allies." "The Allied and Associated governments recognize that the resources of Germany are not adequate . . . to make complete reparation for all such loss and damage. The Allied and Associated governments, however, require, and Germany undertakes, that she will make compensation for all damage done to the civilian population of the Allied and Associated Powers and to their property during the period of the belligerency of each as an Allied or Associated Power against Germany by such aggression by land, by sea, and from the air, and in general all damage as defined in Annex 1 hereto" (Article 232). Annex 1 set forth the 10 categories alluded to above, including pensions and separation allowances. A Reparation Commission was to be established composed of five members, four of whom were to be representatives of the United States, the British Empire, France, and Italy respectively, and the fifth to represent Belgium, Japan, or Jugo-Slavia, according to the specific nature of the business engaging the Commission's attention. Most of the important decisions had to be unanimous. After receiving reports of the various governments as to the extent of their claims under the various categories, the Commission was to calculate the sum total of Germany's obligations and concurrently draw up a schedule of payments prescribing the time and manner of payment within a period of 30 years from May 1, 1921. It was given discretion to extend the term and also to modify the form of payments but not to cancel any part, except with the specific authority of the several Allied governments concerned. In order to enable the Allied and Associated Powers to proceed at once to the restoration of their industrial and economic life, pending the full determination of their claims, Germany was to pay in gold, commodities, ships, securities, or otherwise, before May 1, 1921, the equivalent of 20,000,000,000 gold marks, from which should be deducted the cost of the armies of occupation and certain limited sums for the purchase of food and raw materials. Germany agreed to apply directly to reparations her economic resources, including merchant shipping, coal, dyestuffs, and chemicals, and to make restitution of cash, securities, animals, and objects of art seized or sequestrated. Provision was to be made for the issuance of several series of gold-bearer bonds as determined by the Reparation Commission. Other provisions of the treaty deprived Germany of territory, population, and resources, thereby gravely impairing her capacity to pay. The German Empire, "built more truly on coal and iron than by blood and iron," had the economic foundations of its prosperity virtually swept away.

The Treaty of St. Germain (Sept. 10, 1919) required Austria to pay "a reasonable sum" on account before May 1, 1921, and to hand over all her merchant marine, 20 per cent of her river shipping, and animals, machinery, and equipment up to the limit of her capacity. The total amount due from Austria for reparation was to be fixed in May, 1921, by the Reparation Commission. A special settlement of the Austro-Hungarian debt was arranged (see AUSTRIA). In 1921, due to Austria's distressing financial and industrial condition, the Allies decided to waive, for the time being, all their outstanding claims against her on account of reparation. The Treaty of Neuilly (Nov. 27, 1919) obligated Bulgaria to pay 2,250,000,000 gold francs in half-yearly installments of 37 years. Up to April, 1922, Bulgaria had paid 799,000,000 gold francs, and in the spring of 1923, first of all the vanquished nations, she was able to make definite and satisfactory arrangements with the victors. Hungary, by the Treaty of the Trianon (June 4, 1920), was to pay a reasonable sum, fixed by the Reparation Commission, before May 1, 1921, when her total liability was to be fixed by the same body, with provisions for the discharge of the balance in semiannual installments over a period of 30 years unless a respite or remission were granted by the Allies. She had to surrender all her merchant shipping, 20 per cent of her river fleet, and an indefinite quantity of live stock. Hungary's payments were long delayed by her presentation of counterclaims against Rumania for losses sustained during the invasion of 1919. By the Treaty of Sèvres (Aug. 10, 1920), the Allies waived their claims for reparation from Turkey, although she was obligated to pay the costs of Allied armies of occupation and to compensate civilian nationals of the Allies for loss or damage suffered in the War through the action or negligence of the Turkish authorities; but even these claims were canceled by the later Treaty of Lausanne (July 23, 1924). The Reparation Commission, tentatively organized in June, 1919, was put into formal operation in January, 1920. Although, according to the Treaty of Versailles, it was to have "wide latitude as to its control and handling of the whole reparation problem," including the interpretation and administration of the reparations sections of the treaty and the receipt and distribution among the Allies of the payments made by Germany, it was also provided that members of the Commission should be responsible to their respective governments alone. Consequently the subsequent history of the reparations problem revolved not merely around the

deliberations and decisions of the Reparation Commission but also around intricate and interminable negotiations between and among the various governments, with a view to achieving a settlement in consonance with seriously divergent and seemingly irreconcilable national interests. The theme of reparations thenceforth is one of confusion and of international maladjustment, of stern economic realities obfuscated by political vagaries and extravagances, of persistent French intransigeance and a ruthless determination to coerce Germany into paying or to ruin her, of British vacillation and ultimate reversal of policy dictated by inexorable economic considerations, of German official remissness amounting to defiance and a struggle on the part of German industrialists to escape their obligations, and of American aloofness and short-sighted pursuit of national economic advantage and a mythical political isolation.

Reparations constituted perhaps the most important single item on the agenda of the long series of Continuation Conferences inaugurated in the spring of 1920 to deal with the unliquidated problems of the peace. (See PEACE CONFERENCE AND TREATIES.) The Supreme Council of Allied Premiers overshadowed the Reparation Commission and usurped its functions. At San Remo in April it was decided to grant the Germans a hearing, although Premier Millerand of France, by yielding to Premier Lloyd George on Turkey and to Premier Nitti of Italy on Russia, secured a pledge that the Treaty of Versailles would be enforced to the letter. Lloyd George and Millerand conferred at Hythe (May 15–16) and at Boulogne (June 21–22) for a preliminary discussion of the measures to be taken. A special commission of experts being appointed to gauge the capacity of Germany to pay, Raymond Poincaré, French member and president of the Reparation Commission, resigned in protest. At Brussels on July 2, Allied experts tentatively advised that the German indemnity should be $60,000,000,000, including interest charges. No agreement was then possible as to the manner of distribution. Italy held out for 20 per cent. At Spa (July 5–16) Germany's request for a definite determination of the amount of reparation was denied. The discussion of coal deliveries threatened to disrupt the conference, but Germany yielded to an Allied ultimatum demanding 2,000,000 tons a month. A protocol signed at Spa on July 16 apportioned reparation receipts among the Allies as follows: France, 52 per cent; British Empire, 22 per cent; Italy, 10 per cent; Belgium, 8 per cent; Japan and Portugal, three-quarters of 1 per cent each; the remaining 6½ per cent was to be reserved for Jugo-Slavia, Greece, and Rumania. In the disposition of Austrian, Bulgarian, and Hungarian reparations a special arrangement was devised, 50 per cent going to the Powers in above-mentioned proportions, an additional 20 per cent to Italy, and 30 per cent to Greece, Rumania, and Jugo-Slavia.

Negotiations relative to reparations, continuing throughout the year, saw the development of serious differences between France and England over this question and also over Russia and Turkey. A joint conference of Allied and German economic experts was held at Brussels (Dec. 15–22, 1920, and Jan. 10, 1921). Here it was proposed that Germany should pay annual installments of 3,000,000,000 gold marks from 1921 to 1926, 6,000,000,000 from 1926 to 1931 and 7,000,000,000 thereafter until 1963. From January 25 to 29, 1921, the Supreme Council met at Paris. The French from the outset objected to a fixed sum, afterward insisting that it should not be less than 400,000,000,000 gold marks, including interest. Lloyd George, supported by the Italians, vigorously objected; and a compromise decision was reached. Subject to Allied sanctions in case of default, Germany was to pay within 42 years the sum of 226,000,000,000 marks or its equivalent on a sliding scale of annuities. The German government, supported by national sentiment, frankly asserted that they could not accept the Allied terms, although they consented to attend a new conference at London (Mar. 1–7, 1921), to which they had been summoned "to agree to the decisions of the Paris Conference." On March 1, the Germans offered to pay 50,000,000,000 gold marks present value, with a deduction of 20,000,000,000 for payments already made. Lloyd George, replying on March 3, rejected the German offer, insisted that Germany's responsibility for the War was decided by the Treaty of Versailles founded on that fact, and delivered an ultimatum requiring acceptance of the Allied reparation demands within four days. Lloyd George was supporting French plans in Europe in order to secure French acquiescence in British Near Eastern projects The German reply being deemed unsatisfactory, a force of French, Belgian, and British troops occupied the cities of Düsseldorf, Duisberg, and Ruhrort, in the heart of one of Germany's greatest industrial regions. The results of this coup de force were nugatory, however, and France threatened to occupy the whole Ruhr basin. New schemes were then propounded, including a German request for American mediation. A conference of the Entente Premiers was held at Hythe (April 23–24) to formulate a tentative programme for the enforcement of Allied terms. On April 27, the Reparation Commission announced that it had decided unanimously to fix at 132,000,000,000 gold marks the amount of damages for which reparation was due. Of this total, approximately 45,000,000,000 were for material damage and 87,000,000,000 for pensions and separation allowances. Germany was to pay this in addition to Belgium's war debt, provisionally estimated at 4,000,000,000 gold marks. Three series of bonds were to be issued, bearing 5 per cent interest and 1 per cent amortization: series A, comprising 12,000,000,000, and series B, 38,000,000,000, to be issued in 1921; and the third, series C, for 82,000,000,000, to be issued at the discretion of the Commission. Payments were to be made in the form of annuities supplemented by 26 per cent of the value of German exports. The acceptance of the Commission's reduction of claims without a murmur by the Supreme Council marked the end of the exclusively political period of the reparations question. The Allied Conference of London convened on April 30; on May 5 it dispatched to Germany an ultimatum requiring acceptance of these terms. Confronted with the threatened French occupation of the Ruhr, Germany yielded on May 10. The Fehrenbach ministry, organized in July, 1920, had been superseded during the crisis by a new coalition cabinet headed by Chancellor Wirth.

Although Germany subsequently sought modification of these terms, France insisted that she carry them out. The first payments due were paid, and on September 29 Düsseldorf, Duisberg,

and Ruhrort were evacuated. On Oct. 6, 1921, an economic pact was concluded at Wiesbaden by Rathenau and Loucheur, the German and French ministers of reconstruction; it provided for more effective reparation in kind, similar provisions in the Treaty of Versailles having been nullified by the obstructionist tactics of French industrialists and trade unionists France was to receive building materials from Germany in lieu of her share of the 26 per cent export tax, and Germany was to be credited with not more than 1,000,000,000 marks each year for 14 years to cover such deliveries Only a few deliveries were made under this plan, however, even as revised in 1922 Meanwhile the German government was encountering extraordinary difficulties in financing reparations payments due in part to the world-wide business depression and to the policy of truculent opposition of German industrial magnates, led by Hugo Stinnes. An economic conference held at Brussels during September under the auspices of the League of Nations deliberated on feasible measures to prevent financial and economic chaos in Europe, but although its discussions proved illuminating, its activities were relatively fruitless. Unsound war finance and peace-time burdens led to a marked decline in the value of German currency A serious flight of capital from Germany, effected through the exchange of marks for foreign currency, greatly aggravated the situation The fall of tax receipts to an insignificant value resulted in prodigious budgetary deficits which impelled the government to embark on an inflation policy, leading in turn to still further depreciation of the value of the mark. (See GERMANY.) All these factors tardily convinced the Reparation Commission that Germany needed relief from cash payments, and at brief intervals Allied conferences were held, at each of which the amounts currently payable by Germany were reduced. On Dec 14, 1921, the German government officially notified the Commission that it would be unable to pay the installment due Jan 15, 1922, or the other quarterly installments due in 1922, and in lieu thereof it proposed a smaller payment. This led to an Allied investigation and discussion of the problem at Conferences held at London on Dec. 22, 1921, and at Cannes on Jan. 4–13, 1922 Lloyd George offered France a defensive, political, and military alliance in return for a modification of its attitude toward Germany, but French public and parliamentary opinion was opposed to concession. The conference was suddenly disrupted by a ministerial crisis in France which resulted in the displacement of Premier Briand by ex-President Poincaré, an ardent nationalist and implacable enemy of Germany. This change in the French government presaged a serious rift in Entente solidarity and definitely prefigured the military occupation of the Ruhr. On January 13, the Reparation Commission granted a provisional and partial moratorium to Germany. On Jan 28, 1922, Germany offered to pay 720,000,000 gold marks cash annually, distributed evenly throughout the year with 1,450,000,000 gold marks annually in kind. On March 21, the Commission decided to grant Germany's request, although in addition it stipulated that Germany should institute sweeping reforms in her financial administration and prevent further flight of capital from the country.

Premier Poincaré, whose diplomatic policy diverged widely from that of Lloyd George, strongly advocated leaving the problem of reparation to the Reparation Commission. But it soon found its way into the agenda of the Supreme Council again. On Mar. 11, 1922, the Paris Conference requested the Commission to study the possibility of a German external loan. The International Bankers' Loan Committee, which met between May 24 and June 10, found such a plan impracticable so long as Germany's external obligations were not reduced. Meanwhile the 34 Power plenary conference held at Genoa (April 10–May 19), revealed even more strikingly the grave impasse in international reconstruction presented by the reparation and Russian problems. (See RUSSIA.) Prospects of a Russo-German rapprochement, signalized by the Treaty of Rapallo (April 16), which provided for the reëstablishment of diplomatic relations and mutual renunciation of war claims and financial obligations, recemented the Anglo-French entente temporarily, but otherwise the deliberations of six weeks proved devoid of practical consequences. On July 14, 1922, the German government requested an extended moratorium, and a somewhat reduced reparation payment was made under evident duress on July 15. The thirteenth inter-Allied Continuation Conference was convened at London during August, 1922, to discuss reparations and war debts. On August 1, the British foreign minister, Balfour, issued a note offering to remit all war loans due Great Britain and to abandon all further rights to German reparations if reciprocal action were taken by other nations He offered to cancel the $12,000,000,000 due Great Britain, if the United States would cancel the British obligation of $5,000,000,000 The American government refused to entertain any such proposition. At the London Conference the British and French premiers were absolutely deadlocked on the subject of German reparations, although Berlin was granted a respite on the August 15 payment and it was agreed that henceforth the obligation of collection should rest on the individual governments. Poincaré favored imposing stringent "productive guarantees" on Germany and suggested elaborate schemes for the control of German resources. On August 31, a compromise arrangement was devised, granting Germany a conditional respite for six months; simultaneously a new agreement for delivery of reconstruction supplies to France was negotiated by Hugo Stinnes and Senator de Lubersac. With the passage of months, however, the situation grew worse and worse. A committee of foreign financial experts reported that stabilization of the mark was dependent on Germany's own efforts. On Nov 8, 1922, the German government requested an indefinite moratorium on all payments and a revision of the total to be paid. Great Britain, more keenly desirous of stabilizing Germany and restoring the German market, consistently pursued a policy of opposing French militarism and of advocating the fixation of a definite and reasonable sum of reparation. Poincaré adhered to his policy of no concession and ruthless coercion. Belgium was definitely allied with France, while Italy, for business reasons, supported the British until the Fascist coup d'état produced an Italian dictatorship more sympathetically inclined toward French strong-arm measures The autumnal crisis in Near Eastern affairs (see PEACE CONFERENCE AND TREATIES) exacerbated Entente differences. The downfall of Italian, German, and British cab-

inets (see ITALY, GERMANY, and GREAT BRITAIN) failed to clarify or ameliorate the situation. Another Allied conference, attended at London (December 9–11) by the British, French, Belgian, and Italian premiers, accomplished nothing beyond exchange of views. On Dec. 26, 1922, the Reparation Commission, despite British opposition, declared Germany in voluntary default on 1922 wood deliveries. On Jan. 9, 1923, similar action was taken in regard to coal deliveries. Meanwhile, at an Allied conference in Paris (Jan. 2–4, 1923) detailed plans were presented for coping with the problems of reparations and international indebtedness. Great Britain and France, although agreeing on a reduction of the reparations total to 50,000,000,000 gold marks and the institution of a comprehensive financial control over Germany, were diametrically opposed on methods of guarantee. Bonar Law, combating the punitive measures proposed by Poincaré, declared that their execution would not produce reparation. The French, whose prime consideration was to maintain security by rendering Germany impotent, refused to agree to any practical programme.

France and England had reached the parting of the ways. On January 11, after preliminary warnings, a Franco-Belgian army occupied the Ruhr valley, the heart of industrial Germany, containing her principal coal and iron deposits, her greatest industrial establishments, and 7,000,000 inhabitants. The legality of this procedure was denied by the Germans and doubted by the British, but the French and Belgians, brooking no criticism, announced that they were acting under the provisions of Paragraphs 17–18 of Annex 2 to Part VIII of the Treaty of Versailles, which authorized the respective Allied governments in case of a voluntary default by Germany to take such measures as they deemed necessary. Although embarrassed from the outset by civil obstruction and passive resistance on the part of the inhabitants, including trade unionists and industrialists (see GERMANY), the French took strong measures of repression and retaliation, and by March they had an unbroken military and customs line stretching from Switzerland to Belgium and Holland All the horrors of military rule were enacted in the Ruhr, thousands of Germans being intimidated, incarcerated, or exiled, and the normal activities of industrial life almost completely suspended. For months the French and German governments remained obdurate in their determination not to yield, the British seeking in vain to effect a compromise settlement. Gradually Germany, seriously crippled by the disruption of her economic system, was forced to recede from her extreme attitude. On May 2 and June 9, 1923, she outlined a new proposal involving the mortgaging of her railway system, the offering of guarantees on other industries, and the pledging of certain import and excise duties to reparation payments. Guaranteed annuities, secured by these means, and totaling 1,200,000,000 gold marks, were to be paid after July, 1927. The Ruhr was to be evacuated and economic connections with Germany reëstablished. Germany also agreed to submit to determination by an international commission of her capacity to make further payments. On June 8, Poincaré flatly refused to iscuss any offer as long as the German resistance in the Ruhr continued. He made it perfectly clear that France and Belgium intended to retain control of the Ruhr until Germany paid the schedule of reparations fixed in May, 1921. By degrees the French had restored a semblance of economic order in the Ruhr region, and partial production was resumed. Nevertheless, Great Britain remained antagonistic, the United States appeared distinctly unsympathetic, Italy failed to back the Ruhr policy vigorously, opposition developed in Belgian labor and shipping circles, and protests were made by Sweden, Holland, and Switzerland. In a note of July 20, 1923, the British government, while pronouncing the German proposals unacceptable, suggested that they were at least worthy of consideration, and to this end it proposed an investigation of the reparations situation by a committee of impartial experts. An exchange of notes during the summer merely confirmed the French in their intransigeant attitude of utilizing only the Reparation Commission as an administrative or investigating body and of retaining the Ruhr until full payment was made by Germany. By September, 1923, German passive resistance in the Ruhr had definitely broken down and subsequently her industrial magnates were forced to come to terms with the French. A series of short-time agreements henceforth regulated German deliveries in kind.

On Oct. 5, 1923, the Reparation Commission announced that up to June 30, 1923, reparation payments had totaled 8,213,670,000 gold marks, of which 3,250,000,000 was in merchandise, 1,900,000,000 in cash, and the remainder in the form of credits for shippings, cables, Saar Valley mines, and ceded territories Of this total, 5,494,782,000 gold marks had already been allocated to Allied recipients: 1,255,339,000 to Great Britain, 1,803,967,000 to France, 1,730,126 to Belgium, 338,621 to Italy, 204,368 to Serbia, 68,368 to Japan, and lesser amounts to other countries. Germany, however, contended that she had paid gold and cash to a value of more than 45,000,000,000 gold marks. The most exhaustive nonpartisan study made up to 1924 would indicate that Germany had paid from 20,000,000,000 to 26,000,000,000 gold marks The advancing months of 1923 saw a slightly more coöperative attitude on the part of the American government. While the United States had maintained continuous unofficial relations with the Reparation Commission through "observers," she had consistently refused to be represented at any international economic conference. (See UNITED STATES.) In October, 1923, in response to British inquiries, the American government expressed the opinion that "competent American citizens would be willing to participate in an economic inquiry . . . through an advisory body appointed by the Reparation Commission" France, while emphasizing her continued opposition to reduction of the German obligation, eventually consented to the inquiry. The Reparation Commission voted (Nov. 23, 1923) to appoint two committees of experts, one to inquire into means of balancing the German budget and of stabilizing German currency, and the other to examine and report on the extent and methods of the export of German capital to avoid reparation payments. On December 27, the personnel of the committees was announced, the first comprising 10 members, including Brigadier-General Dawes and Owen D. Young, prominent American financiers and businessmen, and the second five members including H. M. Robinson, an American banker. All the experts were men of large experience in the fields of

public or private finance. The first committee met at Paris on January 14, with General Dawes as its chairman, and the second on January 21, with Reginald McKenna of Great Britain as president.

After three months of exhaustive investigation and deliberation, the Dawes Committee made a unanimous report to the Reparation Commission on Apr. 9, 1924. In essence this report provided: (1) Germany must meet to the full extent of its capacity its external obligations as imposed by the Treaty of Versailles; (2) the payments should be made on a sliding scale beginning with 1,000,000,000 gold marks for the first year, to be increased after four years to 2,500,000,000 gold marks annually; (3) these charges should be defrayed from taxation, the railways, and industrial debentures, and a mortgage for this purpose should be placed on the industries of the country; (4) an index of prosperity should be devised and utilized, as more reliable than an index of export statistics in determining Germany's ability to pay more than 2,500,000,000 gold marks annually after the first five years; (5) a foreign loan of 800,000,000 gold marks should be obtained, so as to satisfy the requirements of the gold reserve and to aid in the payment of immediate obligations; (6) a bank of issue should be created to promote the stabilization of German currency, as a fundamental economic prerequisite; (7) an international organization of control should be set up, to consist of a trustee for railway and industrial bonds, three commissioners of railways, the bank, and revenues, and an agent in charge of the actual payment of reparation; and (8) France and Belgium should relinquish economic control of the occupied territories. The McKenna report (Apr. 5, 1924) estimated that 6,750,000,000 gold marks had been exported from Germany and pointed out that the total foreign money lost through investment in German marks equaled the total sum of reparation cash payments made by Germany to date. The expert's reports elicited widespread commendation in Allied and neutral countries and in Germany, although some complaint was made that the Dawes committee had not been able to fix the total of German obligations. The Reparation Commission on April 11 approved the reports as offering a practical basis for rapid solution of the reparations problem, and by the middle of April the several Allied governments as well as Germany accepted them in principle. The Germans announced, however, that the evacuation of the Ruhr was indispensable for Germany's complete coöperation. The French, just recovering from a serious financial crisis due to the fall of the franc (see FRANCE), expressed satisfaction with the Dawes plan though reviving the old question of guarantees.

The situation was somewhat clarified by the outcome of the Franco-German elections of early May. In Germany, parties pledged to acceptance of the plan won a majority in the Reichstag, although not the two-thirds required for the alienation of control over the national railway system contemplated by Dawes and his associates. In France Premier Poincaré's *bloc nationale* was defeated, and in June the Radical Socialist leader, Edouard Herriot, became Premier. He immediately relaxed the coercive control over the Ruhr and permitted the return of some hundreds of thousands of German exiles. During June and early July he coöperated cordially with Ramsay Macdonald, the Labor Premier of Great Britain, in endeavoring to ensure Entente solidarity in putting the Dawes plan into operation. A new Allied conference on reparations, the first since January, 1923, was called to meet in London on July 16, 1924. The Republican administration in the United States, gratified by the report of the Dawes committee, promised to send a representative—a long-hoped-for act of cooperation in the economic rehabilitation of Europe. Equally auspicious was the nomination of General Dawes as the vice presidential candidate on the Republican ticket. Preliminary conversations between Herriot and Macdonald, however, while producing cordial personal relations, revealed in all their grim significance the time-honored obstacles to a complete and harmonious settlement; namely, French insistence on adequate sanctions and security and full payment, together with opposition to any British attempt to supersede the Reparation Commission by any other international agency

The London Conference lasted from July 16 to Aug. 16, 1924. Ten countries were represented: the British Empire, France, Italy, Japan, the United States, Belgium, Portugal, Greece, Rumania, and Jugo-Slavia. Among the prominent personages who participated in the deliberations were Prime Minister Macdonald of Great Britain as presiding officer, Premier Herriot of France, Premier Theunis of Belgium, Frank B. Kellogg, the American Ambassador to Great Britain, and later on, Chancellor Marx and Foreign Minister Stresemann of the German Reich.

In its initial stages the Conference was confined to the endeavor of the Allied delegations to agree on a common programme before negotiating with the Germans. Three committees were constituted, the first to deal with the matter of German defaults in reparations payments and the sanctions to be applied in cases of willful defaults, the second to prepare recommendations on the restoration of German fiscal and economic unity as postulated by the Dawes Committee, and the third to perfect arrangements regarding the transfer of payments from the receiving agency in Berlin to creditor countries. Premier Herriot and his French associates, in compliance with pledges previously exacted by ex-Premier Poincaré not to surrender any French rights under the Treaty of Versailles or to relinquish control of the Ruhr, accepted in principle the view that it was unnecessary if not impossible to define exactly the penalties to be imposed on Germany in contingencies such as that which preceded the occupation of the Ruhr, and it was undoubtedly as a concession to these French susceptibilities that on July 19, Committee One unanimously agreed that all rights enjoyed by nations under the Treaty of Versailles were to be preserved intact. At the same time it was further unanimously agreed that investors in the projected loan of 800,000,000 gold marks to Germany were to be guaranteed a prior lien on German resources in event of willful German default. The decision as to whether any default was willful or not was to rest with the original Reparation Commission, but it was obligated to consult the new Agent General of Reparations.

A grave crisis immediately developed regarding the loan formula. This deadlocked proceedings for a week, severely strained the Conference atmosphere, and threatened to disrupt negotiations altogether. The American and British bankers who were depended on to underwrite the

loan objected that the potential application of sanctions by one or more powers, acting not in consonance with all the other Allies but separately, would seriously jeopardize the interests of investors and render the floating of a large loan virtually impossible. Nevertheless, there was a strong resurgence of extreme French nationalism in the Paris press and political circles of opposition, where bitter criticism was leveled at Anglo-American financiers, and there was also manifest tension at London between British and French delegates Matters were smoothed over by the friendly intervention of the American representatives A less unyielding attitude was adopted by the naturally conciliatory Herriot. He and his colleagues busied themselves in devising a formula which would safeguard vital French interests at the same time that it would satisfy the demands of the bankers for reasonable safety for their investments. In response to friendly but firm pressure by Macdonald, Herriot decided to defy Poincaré and to consider an early evacuation of the Ruhr. Several critical days elapsed before a gradually evolved French plan for a special arbitration committee to decide on defaults, together with an offer to withdraw completely from the Ruhr within two years, gained ground in the Conference despite the reluctance of the British. On August 1 the deadlock was broken when Committee One accepted Herriot's arbitral scheme, and on August 2 full accord was reached by the Conference on all outstanding points

The second phase of the Conference opened on August 5 when the report as adopted in plenary session was placed in the hands of Marx and Stresemann, the German representatives dispatched to London. The German chancellor praised the Dawes Report and expressed the desire of his government to carry out its provisions in good faith. He emphasized Germany's concern on two points, first, the complete economic evacuation of the Ruhr; and secondly, the early abandonment of French military occupation of the region. On August 7 the Germans accepted the Allied default arrangement without amendment. On August 8 Herriot left for Paris, where at a ministerial council (August 10) he secured the approval of his colleagues for his actions and an authorization from President Doumergue and Marshal Foch to settle the Ruhr occupation solely with regard to reparations, thereby temporarily subordinating the question of security. The French simultaneously declared in favor of disarmament control over Germany by the League of Nations. Meanwhile affairs progressed rapidly at London, through a promising spirit of mutual conciliation and coöperation. On August 10, the Reparation Commission sitting at London and the German representatives signed a protocol for setting the Dawes Report into operation, and on August 16 a general protocol with four annexes was adopted incorporating this and all other agreements of the Conference. This protocol was to become valid only when the representatives of the states participating in the Conference should signify the formal assent of their governments and affix their signatures in London on August 31.

Briefly, the agreements were as follows: Germany was to promulgate and enforce the laws required to carry out the Dawes Report, especially those provisions relating to the bank, railways, and industrial debentures, and to apply certain provisions regarding the control of the revenues assigned as security for the annuities. The Reparation Commission on its part undertook to help execute the recommendations of the Dawes Report, especially in the way of facilitating the projected loan and making an accounting of necessary adjustments. Disagreements between the German government and the Reparation Commission as to the interpretation of this agreement and of the German legislation involved were to be resolved by a special committee of three arbitrators appointed one each by the Commission and the government, and a third, an American as presiding officer, to be appointed by joint action, or, failing agreement, by the President of the Permanent Court of International Justice. Germany further agreed to facilitate in all ways possible the making of deliveries contemplated under either the Treaty of Versailles or the Dawes Report, the programme of such deliveries, in case of non-agreement either between members of the Reparation Commission or between the Reparation Commission acting unanimously and the German government, was to be determined by a committee of three independent and impartial arbitrators, whose chairman should be an American citizen. A mixed committee of Allied and German representatives was to determine procedure for deliveries in kind. Differences in opinion between the German government and the Transfer Committee contemplated under the Dawes Report were to be settled by reference to an arbitrator chosen by the President of the Court of International Justice. Provision was made for dealing with "concerted financial manœuvres." Technical improvements in reparations proceedings might be made through submission of any disputed points to an impartial arbitral committee. The Allied governments engaged with Germany to assist in the speedy restoration of a large measure of Germany's fiscal and economic unity. The French were to evacuate the Ruhr completely within one year. Furthermore, "in order to bring about mutual conciliation and in order to wipe out the past to the utmost extent possible," the Allied governments and the German government exchanged reciprocal assurances of general amnesty for nationals having committed political offenses in the occupied territory since Jan. 11, 1923. Such modifications in Annex II of the Treaty of Versailles as were made necessary by the Dawes Report and the London Compact were specifically sanctioned by an inter-Allied agreement constituting Annex IV of the London Protocol. The Allied governments agreed to safeguard specific securities pledged to the service of the 800,000,000 gold marks loan and granted investors a prior claim on any resources of Germany, subject to a general charge in favor of the loan.

The London Conference was undoubtedly a success. It was made so by the supervention of economic realities hitherto obfuscated by political vagaries and extravagances, and it was also helped along by the astute but frank diplomacy of the liberal-minded Premiers Macdonald and Herriot, by the friendly counsel of American representatives, and by a sympathetic attitude on the part of the German delegates. The vital issue of security for France, temporarily subordinated at London, was to receive attention at the coming September meeting of the League of Nations Assembly. The question of inter-Allied debts, so inextricably intertwined with the reparations problem both historically

and in actual fact, but inflexibly debarred from discussion at London, was to be dealt with at a conference to be held in Paris in the near future, Macdonald having promised a liberal attitude in the matter.

RESEARCH COUNCIL, NATIONAL. A scientific organization established in 1916 by the National Academy of Sciences at the request of the President of the United States and continued under the charter of the Academy by an executive order of the President in 1918. Its purpose is the encouragement of research in the biological and physical sciences. It is organized in 11 divisions, four of general relations and seven covering the major fields of science and technology. The membership of these divisions is composed of representatives of more than 70 scientific and technical societies of the United States, who are in majority, together with representatives of the Federal government and a limited number of members-at-large. Since the close of the War the Council and its activities have been supported wholly by private funds, principally by the income from an appropriation of $5,000,000 made by the Carnegie Corporation of New York. Other funds have been appropriated by various agencies, including the Rockefeller Foundation, General Education Board, and many industrial corporations and individuals. Part of the appropriation from the Carnegie Corporation was used for the erection of a building for the joint use of the National Research Council and the National Academy of Sciences, located at B and 21st Streets, N.W., Washington, and completed in 1924. The Council maintains two regular series of publications: *Bulletins*, of which 46 were issued up to Sept. 1, 1924, and the *Reprint and Circular Series*, in which 55 titles had appeared up to the same date. In addition, the Council issues various miscellaneous publications. The chairman of the Council for the operating year 1923–24 was Gano Dunn; the permanent secretary, Dr. Vernon Kellogg. The same officers remained in power for 1924–25.

RESERVES, ORGANIZED. See ARMIES AND ARMY ORGANIZATION.

RESERVOIRS. See DAMS.

RESPIGHI, OTTORINO (1879–). An Italian composer, born at Bologna. He received his musical education there at the Liceo Musicale under F Sarti (violin) and G. Martucci (composition) and was professor of composition there from 1913 to 1919. He later filled a similar position at the Liceo in Rome. His works comprise the operas, *Ré Enzo* (Bologna, 1905), *Semirâma* (ib., 1910), and *Belfagor* (Milan, 1923); a puppet-play, *La Bella Dormente nel Bosco* (Rome, 1922); for orchestra, *Sinfonia Drammatica*, *Danza delle Gnomidi*, *Notturno*, *Burlesca*, and a symphonic poem, *Fontane di Roma; Concerto Gregoriano* for violin and orchestra; a piano concerto; a cantata, *Aretusa;* two string quartets; a violin sonata; and pieces for piano, for organ, and for violin. He brought out a critical edition of Monteverde's *Lamento d'Arianna*.

REUNION. An island possession of France in the Indian Ocean, 420 miles east of Madagascar. Area, 970 square miles; population (1921), 173,190, made up as follows: 167,789 of French origin, 2903 British Indians, 1052 Chinese, and several hundred Africans and Arabians. Chief towns are: St. Denis, the capital, 21,538 inhabitants; St. Pierre, 27,895; St. Paul, 19,456. Chief products continued to be sugar, rum, coffee, manioc, tapioca, vanilla, and spices. Chief exports were sugar (55,564 metric tons in 1921) and rum (875,820 gallons). The advances made by the colony may be gauged from the following trade figures: exports for 1913 and 1921, 16,592,000 francs and 78,654,500 francs; imports for same years, 24,935,000 and 71,269,555. Chief imports were food-stuffs and cotton goods. The 1922 budget balanced at 14,501,770 francs. In 1912 the figure was 5,071,980 francs.

REUTER, GABRIELE (1859–). A German novelist and essayist (see VOL. XIX). The success of her early novel, *Aus Guter Familie*, an eloquent plea for a broader life for the unmarried daughters of the German middle class, gave her a prominent rank among women writers of her country. She resided for some years in Switzerland but later returned to Berlin and published *Das Neue Land* (1916); *Die Jugend einer Idealistin* (1917); *Die Herrin* (1918); *Grossstadtmadel* (1919); and the autobiographical *Vom Kinde zum Menschen* (1921).

REVENTLOW, ERNST, COUNT (1869–). A German journalist (see VOL. XIX), who contributed largely to the war literature of his country. Among his later works were: *Der Vampyr des Festlandes* (1914); *Heucheleien Britischer Minister* (1915); *Der Einfluss der Seemacht im Grossen Kriege* (1917); *Die Politische Vorgeschichte des Grossen Krieges* (1918); and *Das Diplomatische Vorspiel des Grossen Krieges* (1920).

REVERSION. See HEREDITY.

REY, ABEL (1873–). A French professor of philosophy, born at Chalon-sur-Saône, and educated at the Sorbonne. He taught philosophy at the Lycées of Bourget and Beauvais, with the Faculty of Letters of the University of Dijon, and finally at Paris. He is best known as a philosopher of natural science and as the author of *La Théorie de la Physique chez les Physiciens Contemporains et le Mécanisme.* His other works include a manual of *Leçons de Psychologie et de Philosophie; La Philosophie Moderne;* and *Les Sciences Philosophiques, leur Etat Actuel.*

RHENÉ-BATON (1879–). A French conductor and composer, born at Courseulles-sur-Mer in Calvados Having studied piano with private teachers, he attended for two years the advanced class of C. de Bériot at the Paris Conservatoire and then studied composition as a private pupil of A. Gédalge After one year as chorus-master at the Opéra Comique he became conductor of the Concerts Populaires d'Angers, then of the Concerts Durand, and later of the Société Sainte-Cécile at Bordeaux. He directed the concerts at the Kursaal in Scheveningen in 1914–19 and in 1919 became conductor of the Concerts Pasdeloup in Paris. In 1910 he conducted a festival of French music in Munich and in 1915 a similar festival in Rome. In the spring of 1914 he was conductor of a season of Russian opera in London. His compositions include *Variations* for piano and orchestra; the orchestral works *Prélude et Fugue*, *Menuet pour Monsieur*, and *Frère du Roy;* a suite, *Fresques Antiques;* a violin sonata; and interesting piano pieces and songs. A ballet and an opera were still in manuscript and not yet produced in 1924.

RHENISH REPUBLIC. See GERMANY; RHINELAND.

RHEUMATISM, CHRONIC. Within the 10 years 1914–24, the doctrine that chronic affections of the joints, muscles, tendons, ligaments, etc., and painful affections of the nerves are most frequently due to absorption of poisonous matter from small deposits of pus in various localities attained wide diffusion and incidentally brought the physician and dentist into close relations; since in perhaps a majority of these cases the deposits of pus are believed to be of dental origin The theory, which originated largely in the United States, has also been accepted in Great Britain, but the Continent of Europe is still skeptical, the result probably of lack of communication between Europe and America during and after the War. This view has led to much upsetting of values and the extreme practice of conservative dentistry with the universal use of crowns and bridges is now largely regarded as mistaken, and has given way in turn to a movement for the extraction of all infected teeth, followed by a renewed swing towards conservatism.

No one can foresee what will be the prevalent view in the future, but in 1924 the Mayo Foundation was one of the most active advocates of extirpation of all foci of pus, however minute and at whatever cost This institution seemed also to have supplied the proof that infected teeth do cause the most serious of maladies, not only those just enumerated but a good deal of the chronic heart and kidney disease of middle life, to say nothing of ulcer of the stomach, gallstones, appendicitis, etc. Moreover, the removal of these foci does more than prevent and arrest, for in many cases men with serious organic disease appear to make a relative recovery.

It was still a mystery how so many individuals with infected teeth escape all of these diseases and some immunity must exist although it cannot be visualized The field here is far too large to be summed up as chronic rheumatism, and the term "medical sepsis" is sometimes used, which also differentiates this group of diseases from surgical sepsis. The latter is more violent, more of an immediate menace to life, and due to different forms of bacteria See also INSANITY.

RHINELAND. The French policy at the Peace Conference, as represented by Premier Clemenceau and Marshal Foch, was to make the Rhine the western frontier of Germany and either to annex the left bank of the Rhine, i e., the greater part of the Prussian Rhine Province, all of the Rhenish Palatinate, and part of Hesse-Darmstadt, or to set up this territory as a nominally independent but actually French-controlled republic, on the ground that such action was essential to the safety of France and Belgium. When this plan was wrecked by the opposition of Premier Lloyd George and President Wilson, a compromise was arranged whereby the left bank of the Rhine was to be occupied for 15 years by the Allied Powers; evacuation on the expiration of this term was to be dependent on two conditions, the complete fulfillment of the treaty by Germany, and the agreement among the Allies that "the guarantees against unprovoked aggression by Germany are considered sufficient by the Allied and Associated Powers" That these two clauses nullified the 15-year provision and left it to France's discretion to decide when the occupation should terminate has been sufficiently demonstrated by the declarations of the successive French governments from Clemenceau to Herriot that France did not consid r the 15-year provision as having begun to go into operation. Having failed to obtain security in the form of an alliance with England and the United States and having been temporarily thwarted in the attempt to separate the left bank of the Rhine from the Reich, France endeavored to attain this latter aim by means of its army of occupation. Among the divers methods employed in this direction were the consistent attempts to wear out through harsh military rule the spirit of the Rhenish people. Thus a policy of vexatious and arbitrary methods in the administration of justice was used. Whenever it suited French interests, the military authorities interfered with the civil administration by German functionaries. An economic barrier was established between the Rhineland and the Reich, and freedom of thought, of speech, and of the press was ruthlessly stamped out. In many districts white French soldiers were replaced by colored troops of occupation who were persistently reported to have committed acts of brutality against the Rhenish people. At the same time the French were accused by the Rhinelanders of conducting an energetic French propaganda by employing the educational facilities to instill the young Rhenish generation with French spirit and French culture In many respects this policy was a failure and resulted only in arousing and fanning a spirit of extreme German nationalism among the Rhinelanders, even among such persons as otherwise looked on a democratic German republic as the German ideal. The obvious contrast between the just and impartial administration of the Americans and the English in their respective areas and the arbitrary conduct of the French and Belgians created among the Rhinelanders a feeling of respect and sympathy for the Americans and the English, and all the more deepened the antagonism against the French and the Belgians In their utter helplessness the Rhenish people saw with sincere regret the final withdrawal of the Americans and the prospective leaving of the British forces.

The main effort of the French army of occupation was directed toward the creation and the fostering of a Rhenish Separatist movement. Due to the wide temperamental differences between the Rhinelanders and the Prussians in eastern Germany there had always existed in the Rhineland a certain particularistic attitude which resented the inclusion of the Rhineland in Prussia and would have welcomed Rhenish autonomy within the German Reich At no time did this attitude develop into open opposition to Prussia or did the Rhenish people harbor any thoughts of separation from Germany. It stands to reason that with the pressure of the occupation weighing on the Rhenish population and with the great gains, economic and otherwise, to be obtained from separation from Germany, there should have been elements, as in any other country under parallel conditions, which desired to break loose from the bankrupt and seemingly doomed German state. These elements, which numerically were very insignificant and whose views were regarded as treasonable and contemptible by the overwhelming majority of the Rhinelanders, were used by the French as a welcome means to undermine the connection which bound the Rhineland to the

Reich. These Separatists, as they came to be called, received thinly veiled encouragement and secret financial and other assistance from the French and Belgian armies of occupation, while at the same time they were looked at askance by the American and British forces. In the spring of 1920 the Separatists, under the leadership of Dr. Dorten, proclaimed a provisional government and a separate Rhenish republic in Wiesbaden, which belonged to the Mayence bridgehead area Notwithstanding the most active French assistance this coup d'état fell flat, chiefly because of the hostility to the movement of the Rhenish people, who had been aroused by revelations of French influence behind the Separatists. The German government was prevented from taking strong measures against the Separatists by the well-grounded fear of becoming involved in serious complications with the French; it was therefore compelled to look on while attempts were made to disrupt the unity of the Reich. The Rhenish people were left to flounder helplessly between the weakness of their own government and the machinations of the Separatists, who, although weakened by their failure, continued their activities with secret French assistance. When their meetings were upset by the loyal Rhinelanders, the French and Belgian armies went so far as to interfere openly in their favor and to assure them of military protection. With the growing helplessness of the German situation, the ever-tightening hold of the armies of occupation, the economic separation of the Rhineland from the Reich, and the dependence of the people on the armies of occupation, the fervent activities of the Separatists became bolder, and their movement grew in strength, while at the same time the Rhinelanders were discouraged, so that even people who at heart were loyal to Germany turned to Separatism in utter despair as a temporary way out of their miseries and sufferings.

The occupation and all its dismal consequences for Germany brought the Separatist movement to a head. While the French endeavored by economic pressure to reduce the inhabitants to a condition in which they would consent to the creation of an independent Rhenish state under French control, a design which came more and more to be regarded in neutral circles as the true political object of the French in western Germany, the Separatists used the Ruhr situation and the coercive French measures in the Rhineland to their best advantage and struck again. After some preludes during the early part of the year, the Rhenish Republic was again proclaimed on Oct. 21, 1923, this time in Aix-la-Chapelle When the people resisted, a struggle ensued in which the Separatists were sustained by the Belgian troops of occupation. The same occurred in a number of other places in the Rhineland and a short time later in the Palatinate. In each instance the Separatists were only able to maintain themselves because they were openly assisted by the French and Belgian troops or because the German police and the loyal inhabitants were disarmed by the troops of occupation, while the Separatists were permitted to retain their arms. In the northern sections of the Rhineland the movement collapsed quickly because the hostility of the people was too pronounced and because first the Belgians and later the French, under pressure from the British and from international public opinion, withdrew their support. The unsavory character of the Separatists, many of whom had police records or were imported foreign mercenaries, discredited the movement throughout the world and made the French and the Belgians feel ashamed of being connected with it. The movement endured longer in the southern sections of the Rhineland and in the Palatinate, but only because French connivance was more outspoken here than elsewhere. Finally the movement came to an inglorious end there also, but only after the British had intervened against Separatism. When the French thereupon withdrew their support at the end of 1923, the people of the Palatinate rose and killed a number of the Separatists in retaliation for the cruelties committed by them. In order to counteract Separatism a number of leading Rhinelanders set afoot, with permission of the central government in Berlin, a movement for an autonomous Rhineland within the Reich. Regardless of what would have been the attitude of the Rhenish people toward such a possibility in times of peace, Separatism had made them look with distrust on any change in their political status while their soil was occupied by the French and the Belgians. Thus Separatism in the last analysis had strengthened German nationalism in the Rhineland.

RHODE ISLAND. Rhode Island is the forty-eighth State in size (1248 square miles), and the thirty-eighth in population; capital, Providence. The population increased from 542,610 in 1910 to 604,397 in 1920, a gain of 11.4 per cent. The white population increased from 532,492 to 593,980; Negro, from 9529 to 10,036; native white, from 354,467 to 420,481. The foreign-born white population decreased from 179,025 to 173,499. The urban population of the State mounted from 524,654 to 589,180, while the rural decreased from 17,956 to 15,217. The growth of the principal cities was as follows: Providence (q.v.), from 224,326 in 1910 to 237,595 in 1920; Pawtucket, 51,622 to 64,248; Woonsocket, 38,125 to 43,396; Newport, 27,149 to 30,255.

Agriculture. Rhode Island, in common with most of the eastern States, showed a considerable decrease in all phases of agriculture, in the decade 1910–20. While the population increased 11.4 per cent in the decade, the number of farms decreased 22.8 per cent (from 5292 in 1910 to 4083 in 1920); the total acreage in farms decreased from 443,308 to 331,600, or 25.2 per cent; and the improved land in farms from 178,344 acres to 132,855, or 25.5 per cent. The percentage of the total land area used for agricultural purposes decreased from 64.9 in 1910 to 48 6 in 1920; the percentage of farm land improved, from 40.2 to 40.1. The total value of farm property showed an apparent increase of from $32,990,739 in 1910 to $33,636,766 in 1920, or 2 per cent; the average value per farm, from $6234 to $8238, or 32.1 per cent In interpreting these values and all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 4083 farms in 1920, 3245 were operated by owners, 205 by managers, and 633 by tenants. The corresponding figures for 1910 were 4087, 251, and 954. White farmers in 1920 numbered 4063, of whom

3123 were native and 940 were foreign-born. There were 19 Negro farmers and one Indian farmer in 1920. Farms free from mortgage in 1920 numbered 1971, compared with 2811 in 1910; those under mortgage numbered 949, compared with 1180. In 1920 there were 24,914 dairy cows, compared with 23,329 in 1910; "beef cows," 1001 compared with 2525; sheep, 2736 compared with 4206. The estimated production of the principal farm crops in 1923 was as follows: corn, 508,000 bushels; potatoes, 383,000 bushels; hay, 55,000 tons; and apples, 328,000 bushels. Comparative figures, for 1913, are: corn, 402,000 bushels; potatoes, 650,000 bushels; hay, 68,000 tons.

Manufactures. Rhode Island, although one of the smallest States in area and population, is important industrially. There were 11 cities with more than 10,000 inhabitants in 1920, and these formed 83 per cent of the total population of the State. In 1919, they reported 82.7 per cent of the value of the State's manufactured products. There were in the State 1951 manufacturing establishments in 1909; 2190 in 1914; and 2406 in 1919 Persons engaged in manufacturing numbered 122,641, 124,109, and 156,012; and the capital invested amounted to $290,901,270, $308,444,563, and $594,337,448, in those years. The value of the products, in 1909, was $280,343,797; in 1914, $279,545,873; and in 1919, $747,322,858. The increase in value of products from 1914 to 1919 was in great measure due to changes in industrial conditions brought about by the War; but the increase in average number of persons employed clearly indicates a growth in the manufacturing activities of the State. The principal industry in point of value of products is the manufacture of cotton goods. This, in 1909, was valued at $50,313,000; in 1914, at $49,719,000, and in 1919 at $177,423,000. The manufacture of woolen and worsted goods ranks second in 1909, $74,600,000; 1914, $60,889,000; and 1919, $175,312,000. The manufacture of jewelry, in third place, amounted, in 1909, to $20,685,000; in 1914 to $21,522,000; and in 1919, to $48,596,000. The principal manufacturing cities are Providence, Pawtucket and Woonsocket. In Providence, in 1909, there were 1080 manufacturing establishments, with a product valued at $120,241,000; 1207 in 1914, with $115,335,000; and 1274 in 1919, with $267,629,000. Pawtucket had 217 manufacturing establishments in 1909, with a product valued at $37,696,000; 235 in 1914, with $42,029,000; and 284 in 1919, with $135,518,000. Similar figures for Woonsocket are: 130 in 1909, with $28,210,000; 157 in 1914, with $28,115,000; and 190 in 1919, with $93,547,000. Other important manufacturing cities are Newport, Central Falls, Cranston, Cumberland, and East Providence.

Education. Educational progress in Rhode Island was constant in the decade 1913–23. The public school system includes elementary and secondary schools, established, maintained and supported by towns and cities; and two colleges, Rhode Island State College, supported by the Federal government and by the State, and Rhode Island College of Education, the principal function of which is the training of teachers. The State also provides free State scholarships for vocational courses at the Rhode Island School of Design and the Rhode Island College of Pharmacy, and for teachers' training in the Graduate Department of Education at Brown University. Rhode Island has for many years emphasized training for teachers. The Rhode Island College of Education is a model institution which hundreds of visitors from other States and countries visit annually for observation. Nearly 90 per cent of Rhode Island teachers are normal school or college graduates. In 1922–23, nearly half the teachers were enrolled in summer schools or extension courses. The State maintains or supports without contributions or assessments of any kind, a pension system for teachers, to which all employed in public education are eligible. Progress was made in the decade in the establishment of evening schools maintained by towns and cities. Vocational instruction in these schools had an intensive development, the work being very closely related to the predominant State industries. The total enrollment in public and private schools in 1914 was 117,163; in 1924 it was 129,096. The number in elementary schools had increased from 79,193 to 89 719; in high schools, from 7372 to 12,158. The percentage of illiteracy in the State decreased from 9.2 per cent in 1910 to 8.2 per cent in 1920: among the native white population from 0.9 per cent to 0.6 per cent; among the foreign-born white, from 18.1 to 17.5. Among the Negroes illiteracy increased from 11.4 to 12.5 per cent.

Finance. For finance, see STATE FINANCES.

Political and Other Events. During the decade 1914–24 the Democratic and Republican parties shared political control in Rhode Island. In 1914 R. L. Beeckman, the Republican nominee, was elected governor. The Democrats elected a Representative to Congress in one district and the Republicans in two. Charges of corruption and bribery in this election were made and investigations were carried on in 1915 by the Federal Department of Justice. For the first time in the history of the State, the United States Senator, in 1916, was elected by a direct vote of the people. The Democratic nominee, Peter G. Gerry, defeated Senator Henry F. Lippitt, Republican, who was a candidate for reelection. The Republicans, however, reelected Governor Beeckman. In the presidential voting of this year, Charles E. Hughes received 44,858 votes; President Wilson, 40,394 votes. In 1918 the Republicans were generally successful, reëlecting Governor Beeckman and Senator Le Baron B. Colt, together with the entire State ticket, as well as three Representatives in Congress. The Republicans in 1920 were again successful, electing their candidate for governor, Emery J. San Souci, and the other State officers. In the presidential voting, W. G. Harding received 107,463 votes; J. M. Cox, 55,062. In 1922 the Democrats made practically a clean sweep of State offices; the Secretary of State was the only Republican survivor. William S. Flynn, Democrat, headed the Democratic State ticket. Senator Gerry, Democrat, defeated former Governor Beeckman for the United States Senate.

Legislation. The Legislature in Rhode Island meets annually. The most important acts in the decade 1914–24 are noted below. The Legislature of 1916 authorized the organization of coöperative agricultural associations. The laws relating to taxation were amended, and so were the banking laws. In 1919 the Legislature amended the corporation franchise tax. It changed the title of the Commissioner of Industrial Statistics to the Commissioner of Labor

and made provisions for a State Board of Labor. It passed measures for protection against anarchy and incitement to violence. The workmen's compensation law of 1912 was amended and provision was made for the promotion of Americanism by the establishment of night schools, etc. In 1920 the Legislature ratified the suffrage amendment, revised the State corporation law, and authorized a bonus of $100 each for those who had served in the War. In 1921 the Legislature amended the corporation laws and the laws relating to the administration of the State, provided for vocational rehabilitation, made appropriations for the aid of discharged soldiers and sailors out of employment, disbarred women from serving on juries, increased the benefits to employees under the workmen's compensation law, adopted "blue sky" laws to prevent the sale of fraudulent securities and the promotion of wildcat stock schemes, made all women subject to the poll tax of $1 per annum. A prohibition enforcement act was passed in 1922. The Legislature of 1923 created a measure regulating the sale of coal, created a system of mothers' pensions, amended the child labor laws, and passed a measure forbidding anonymous publications of paid matter designed to defeat a candidate for office or a question to be submitted to the electors. In 1924, the Legislature, limited to 60 days' pay, had been in session for seven months, during which, because of a filibuster by Senate Democrats, no legislation was enacted The filibuster by the Democrats, who were the minority but were aided by the Democratic presiding officer, Lieut.-Gov. Felix A. Toupin, was being maintained with the aim of forcing the Republicans of both Senate and House to pass a resolution providing for submission to the people of a proposal to hold a convention to revise the State constitution.

RHODES. See DODECANESE.

RHODESIA, NORTHERN. A British African protectorate, under the administration of the British South African Company until 1924. It has an area of 291,000 square miles and an estimated native population of 928,000. Whites in 1920 numbered 3500 (in 1911, 1947) The leading activities were stock raising, cereal culture, and lead mining. Exports in 1922 were £616,083 as compared with £107,000 in 1911. Imports in 1922 were £500,321, chiefly from the United Kingdom, Southern Rhodesia, and the Union of South Africa. From the United States, imports were £32,303. In 1911 total imports were £168,000. Revenues increased from £116,000 in 1911–12 to £279,000 in 1921–22; expenditures from £190,000 to £339,000. On Apr. 1, 1924, the protectorate was taken over by the British authorities and the typical government of a crown colony established with a governor, executive council, and legislative council.

RHODESIA, SOUTHERN. A British South African protectorate, up to 1923 under the administration of the British South Africa company, but since then a self-governing colony under the British crown. It has an area of 149,000 square miles and a native population of 770,000 (in 1921). Europeans numbered 33,620 in 1921 against 2912 in 1911. Chief towns, with white populations in 1921: Salisbury (5654), Bulawayo (6830), Gwelo (1148), Umtali (1874). Minerals continued to occupy the most important place in the colony's economic scheme. The gold yield in 1923 was valued at £2,909,159. (The high point of the period was reached in 1916 with £3,895,000.) Silver in 1923 yielded £24,526; coal, £225,345; copper, £201,022; chrome ore, £302,880; asbestos, £577,699. The total 1923 mineral output was valued at £4,300,652. To the end of 1923 total mineral output was valued at £69,660,418. Agriculture flourished, with 186,246 acres under maize in 1921. Tobacco and fruit orchards were being developed. In 1920, an important dam capable of holding 4,000,000,000 gallons, was completed across the Mazoe River. Cattle raising was taken up by the Europeans during the period 1912–22 and by 1920 their herds outnumbered the native stocks. Exports in 1922 were valued at £4,627,693, as compared with £2,812,000 in 1910. The United Kingdom and South Africa were the chief countries of destination, while the United States received £572,338. Leading exports were gold, copper, asbestos, chrome ore, tobacco, live stock. Imports in 1922 were valued at £3,879,111 as compared with £2,786,000 in 1910. Most of the imports came from the United Kingdom and the Union of South Africa, while the United States sent £321,356. For administrative purposes revenues were £773,000 in 1910–11, and in 1921–22, £1,532,000. No railway building took place during 1914–24. In 1916 the lands reserved for natives were mapped out, and some 20,000,000 acres were set aside.

History. During the period 1910–22 the British South Africa Company's sovereignty was continually challenged by the white settlers The Company was compelled to enlarge the number of elective members of the Legislative Council, so that by 1922, 13 members were being elected and 6 appointed by the Company. Two bodies of opinion arose out of the War, one favoring incorporation in the Union of South Africa, and the other self-government under the crown. The latter was victorious in the general election of 1920 and was reaffirmed by the voters in a referendum held in October, 1922. Union with South Africa was rejected principally because of the ascendancy of the Dutch Nationalists in the Union, the Rhodesians fearing submergence at the hands of a non-British population. One of the leading points of contention during the period was the ownership of the unalienated lands. In 1918 possession of these lands was denied the South Africa Company, although it was admitted the Company had to be compensated for the deficits it had met in the territory's expenditures. In 1920 a commission fixed this sum at some £4,000,000 for Southern Rhodesia. In Northern Rhodesia the deficit was about £1,250,000. The Company, however, was recognized in its exclusive rights to the mineral lands On July 28, 1923, the rule of the chartered Company terminated when the Legislative Council sat for the last time and the Company's claims were settled. On Sept. 12, 1923, it was announced that Southern Rhodesia's status was that of a self-governing colony.

RHONDDA, DAVID ALFRED THOMAS, VISCOUNT (1856–1918). British colliery owner and food controller in the World War, born in Aberdare, Wales, graduated at Cambridge in 1880. Soon after leaving college he became prominent in the Welsh coal fields and also in Liberal politics. He was elected to Parliament in 1888, and remained a member for twenty-two years. His sympathy with the miners and

his extraordinary ability made him a leader in industrial circles in South Wales. Shortly after the outbreak of the War, he went to America to negotiate war contracts for the British government. In 1917, at Lloyd George's urgent request he accepted the post of Food Controller, and administered that office with conspicuous success, and was created a viscount in recognition of his services.

RHONE CANAL. See CANALS.

RICE, ELMER L. (1892–). An American playwright, born in New York City, who graduated *cum laude* from the New York Law School He wrote, among other successful plays, *On Trial* (1914); *The Iron Cross* (1917); *For the Defense* (1919); *Wake Up Jonathan,* with Hatche Hughes (1921). *It is the Law* (1922); and *The Adding Machine* (1923)

RICE INSTITUTE. An institution of the higher education at Houston, Texas, founded in 1912 The enrollment between 1914 and 1924 practically trebled, with 384 students in the former year as compared with 1050 in the latter, and a faculty of 40 as compared with 65. Eleven scholarships were endowed and a resident lectureship in civics and philanthropy established in 1918 through private support. In 1920 and 1922, similar provision was made for annual lectureships in public affairs and music The construction of a new chemistry laboratory to cost in excess of $600,000 was begun in 1923. President, Edgar Odell Lovett, Ph.D., LL.D.

RICHARDS, THEODORE WILLIAM (1868–). An American chemist (see VOL XIX) During the War he was a member of the National Research Council and served as consulting chemist to the War Department and Bureau of Mines. In recognition of his later achievements in chemistry he was awarded the Franklin medal (1916) and the Nobel prize in chemistry (1916). He became president of the American Chemical Society (1914), the American Association for the Advancement of Science (1917), and the American Academy of Arts and Sciences (1919–21).

RICHARDSON, ERNEST GLADSTONE (1874–). An American bishop, born at St. Vincent, W. I., and educated at Dickinson College and Yale University. In 1896 he was ordained to the Methodist Episcopal ministry and was a pastor of churches in Wallingford, Conn., and New York City until 1920, when he was elected bishop Bishop Richardson was trustee of Clark University and several other educational institutions

RICHARDSON, ROLAND GEORGE DWIGHT (1878–) An American mathematician, born at Dartmouth in Nova Scotia, and educated at Yale University and at Göttingen. During 1904–07 he was instructor in mathematics at Yale and then transferred to Brown, where he became professor (1915) and head of the department of mathematics. In 1918 he also served as a lecturer at the summer school of Chicago University. His specialty was mathematical analysis; he contributed results of his researches to mathematical journals.

RICHET, CHARLES (1850–). A French physiologist (see VOL XIX). Professor Richet published the following works after 1914: *War Nursing,* English translation (1918); *L'Homme Stupide* (1919); *Traité de Physiologie Médico-chirurgicale,* with Charles Richet, Jr. (1921); *Traité de Métapsychique,* an important work on the occult (1922), translated into English as *Thirty Years of Psychical Research* (1923).

RICHMOND. The capital and largest city of Virginia. The population rose from 130,833 in 1910 to 171,667 in 1920 and to 188,833 by estimate of the Bureau of the Census for Apr. 1, 1924. The city charter was changed in 1919. The mayor, instead of the bicameral council, was authorized to appoint the heads of six departments—law, finance, works, welfare, utilities, and safety—while the voters were to elect the city comptroller and city attorney. An advisory board was created. During the 10 years, a bridge 2278 feet long was built over the James River at a cost of $477,774. The fire department was reorganized and zoning regulations were adopted. Capital invested in manufacturing rose from $37,000,000 in 1914 to $97,690,000 in 1923, and the value of the output from $98,-177,000 to $250,000,000. Bank clearings increased from $420,000,000 in 1914 to $2,607,-658,000 in 1923.

RICKENBACKER, EDWARD VERNON (1890–). An American aviator, born at Columbus, Ohio. He was for many years well known as an automobile racer and won many championships. In 1917 he went to France as a member of the motor car staff of the army and in the same year was transferred to the Air Service, with which he served for a time as engineering officer. He was appointed commanding officer of the 94th Aëro Pursuit Squadron, the first American unit active on the western front, and in this service he destroyed 26 enemy planes. He was the first commanding officer to conduct his own squadron into Coblenz and at the end of the War retired with the rank of major. He received the Distinguished Service Cross, the Croix de Guerre, and other decorations. Following his military career he organized and was vice president of the Rickenbacker Motor Company. He wrote *Fighting the Flying Circus* (1919).

RICKETS. Within the 10-year period 1914–24, our knowledge of the nature of this affection has undergone many changes. To quote Dr. A. F. Hess of New York, more has been learned during this period than in the preceding 250 years We know that it may attack the well-nourished as well as the scantily fed child; and as a matter of fact the entire subject of diet is now known to be of much less significance than the absence of fresh air, sunshine and exercise. It is not too much to prophesy that complete child hygiene can eradicate the disease which flourishes in the most civilized lands, but chiefly in the industrial centres, where child hygiene is so unsatisfactory, as a result largely of the necessity of families to huddle in close quarters.

With the discovery of the fat-soluble vitamine it was hastily assumed that rickets was a deficiency disease due to the absence of this growth agent, but this view has been disproved in various ways Thus during the state of undernourishment in some of the warring states, where fats were almost lacking in the diet, there was no notable increase in rickets and, moreover, as stated, the latter sometimes develops in the well-nourished child Nevertheless it is probable that some growth agent is absent from the diet and that this absence is one of the factors in the production of rickets, but by no means the sole one. Professor McCollum has even isolated his so-called vitamine D, which he

regards as the missing growth agent, and which is quite distinct from the fat-soluble vitamine. This principle appears to be concerned in the calcium and phosphorus metabolism, the irregularity of which is responsible for rickets. With ideal child hygiene the need of a vitamine recedes to the background. These newer teachings were finding corroboration from a study of rickets in Hindus and other remote peoples and in animals The Hindu high-caste child with plenty of food but little sun and exercise develops much more rickets than the low-caste child who gets plenty of the latter but scanty food. Young puppies easily develop rickets if confined in dark barrels, even if well fed.

RIDDELL, GEORGE ALLARDICE, first BARON (1865–). An English newspaper proprietor. He acquired large newspaper properties in London and was director of George Newnes, Ltd.; C. Arthur Pearson, Ltd., and several other corporations. He represented the British press at the Paris Peace Conference in 1919–22 and at the Disarmament Conference in Washington in 1921–22. He was made a knight in 1909 and baron in 1920. He wrote *Some Things That Matter* (1922).

RIDDLE, OSCAR (1877–). An American zoölogist, born at Cincinnati, Ind., and educated at the University of Indiana and the University of Chicago. He was a teacher of biology at the Training School in San Juan, Porto Rico (1899–1901), physiology in Central High School, St. Louis (1903–05); assistant (1904–07), associate (1907–08), and instructor (1908–10) in physiology at the University of Chicago; investigator in Europe (1910–11); research associate of the Carnegie Institution (1912–15); and investigator at the Carnegie Station for Experimental Evolution (1914–). He prepared for publication the results of extended observations on the genetics of pigeons made by Professor Whitman and continued these researches especially along the line of the control of sex.

RIFLES. See SMALL ARMS.

RIGA, PEACE OF. See GALICIA; POLAND; RUSSIA; VILNA.

RINDERPEST. See PHILIPPINES, *Agriculture;* VETERINARY MEDICINE.

RINEHART, MARY ROBERTS (1876–). An American novelist (see VOL. XX). Her later stories include: *Tish* (1916); *The Altar of Freedom* (1917); *Long Live the King!* (1917); *Bab, a Sub-Deb; The Amazing Interlude* (1918); *Dangerous Days* (1919); *More Tish* (1921); and *The Breaking Point* (1922). She wrote a number of very successful plays, including *Tish* (produced in Chicago, 1919); *Bab* (New York City, 1920); *Spanish Love* (produced by Maxine Elliott, 1920) and *The Bat,* both in collaboration with Avery Hopwood (New York City, 1920); and *The Breaking Point* (1923).

RIO DE ORO. A Spanish possession and protectorate on the northwest coast of Africa. Area, approximately 109,000 square miles; population (estimate), 100,000. The population, largely Berber and nomadic, was as yet uncontrolled in 1924. Fishing was the chief economic resource.

RIPLEY, WILLIAM ZEBINA (1867–). An American economist (see VOL. XX). He was made director of the Chicago, Rock Island, and Pacific Railway (1917) and administrator of labor standards for the War Department (1918). He was chairman of the National Adjustment Commission of the United States Shipping Board (1919–20) and special examiner on consolidation of railways for the Interstate Commerce Commission (1920–22).

RIPLEY PLAN. See RAILWAYS.

RIPON COLLEGE. A coeducational, undenominational institution at Ripon, Wis., founded in 1851. The enrollment increased from 249 in 1916 to about 491 (including music) in 1924; the faculty increased from 22 to 32 members, and the library from 22,000 to 27,467 volumes. The student enrollment was limited by act of the trustees in 1923 to 500. In 1924, a campaign was started to raise $600,000; of this sum $100,000 was to pay off the indebtedness of the college, and $500,000 was to be used as a permanent endowment. President, Silas Evans, LL.D., D.D.

RISLER, EDOUARD (1873–). A French pianist, born at Baden-Baden in Germany. In 1874 his parents settled in Paris, where he studied at the Conservatory under Diémer (piano) and Chabrier (composition), taking the first prize for piano in both the elementary and the advanced class. After further study under Klindworth, Stavenhagen, and d'Albert he made a very successful début in Paris (1894). He later toured all Europe. He made his first American tour in 1923–24. In 1906 he became a member of the Conseil Supérieur of the Paris Conservatoire. He is considered one of the very greatest of contemporary pianists, a player in the grand style, withal very poetic, with a tremendous technic reverently subordinated to the requirements of artistic expression. His enormous repertoire enables him to give complete cycles of various composers' works (Beethoven, Bach, Chopin, Schumann).

RITCHIE, ALBERT CABELL (1876–). An American lawyer, born at Richmond, Va., and educated at Johns Hopkins University and in law at the University of Maryland. In 1898 he began the practice of law in Baltimore. He was city solicitor (1903–10); assistant general counsel of the Public Service Commission of Baltimore (1910–13); Attorney General of the State (1916–20), and Governor (1920–24). From 1907 to 1920 he was also professor of law at the University of Maryland Law School. During the War he served for a time as general counsel for the War Industries Board. He was the author of *Municipal Condemnation in Maryland* (1904).

RITSCHEL, WILHELM (1864–). An American marine painter (see VOL. XX). He was elected a full member of the National Academy in 1914. He won a gold medal from the National Arts Club (1914) and a gold medal from the Panama-Pacific International Exposition (1915). During the next year he was awarded the gold medal of the State Fair at Sacramento, Cal., and in 1918 the gold medal of the Philadelphia Art Club. In 1921 he won the Ranger Purchase prize from the National Academy of Design and the Isidor medal from the Salmagundi Club in 1923.

RIVERA, FERDINAND PRIMO DE, MARQUIS DE ESTELLA (1871–). A Spanish general and dictator. He served for many years in the army and was one of the most prominent members of the officers' juntas. He served for a time as Minister of War, resigning in 1917 on account of differences with the government in regard to civilian controllers in the army. He undertook to establish a National Committee of Defense whose programme was to end the war in Mo-

rocco and to institute a searching investigation into charges of corruption and incompetency in the conduct of the Moroccan campaign. He was appointed military governor of Barcelona, where he took effective steps against the syndicalists. He made effective efforts to organize the leading officers of the army, and in September, 1923, declared a dictatorship and took practical possession of the government. With the support of the King, he began extensive reforms, but his failure to carry on effectively the campaign in Morocco threatened his downfall in the latter part of 1924 See SPAIN.

RIZA KHAN (SARDAR SEPAH) (?-). A Persian public official and statesman. He was the son of a farmer and became a private soldier in the Shah's Cossack bodyguard, rising to the post of commander-in-chief of the army in February, 1921. On February 20 of that year the military forces under Riza Khan overthrew the existing ministry and set up a new cabinet. The British troops left the capital on May 16, 1921, and it was thought that the Bolsheviks would soon overrun the country. Riza Khan and his army stood in the way, and the invaders were expelled. By the end of 1922 Riza Khan was in complete control of the government and strongly supported the American finance director, Dr. Millspaugh (q v.). The Sheik of Mohommerch was induced to pay $100,000 arrears of taxes, to arrange the payment of $400,000 additional, and to promise to contribute $150,000 a year regularly Riza Khan has been called the "strong man" of Persia

ROADS AND PAVEMENTS. In the United States, the Federal Aid Road Act of 1916, the growth of automobile and motor truck traffic, and railroad conditions during and after the War combined in the interval between 1914 and 1924 to make the building of improved highways a major feature of engineering and public works construction, while more or less similar conditions in other of the civilized countries of the world had the same general effect. State highway construction, which began in a small way in Massachusetts and New Jersey in the early nineties, had by 1914 and 1915 attained large proportions in some parts of the Union. These activities were largely increased with the modest beginning and subsequent large extension of Federal aid through the appropriation of money from the United States Treasury and the large degree of assistance and control in road design and the supervision of road construction under the United States Department of Agriculture in the Bureau of Public Roads. Counties as well as States, and in much lesser degree rural towns and townships, have engaged in highway construction.

As early as 1906, New York State, by popular vote, authorized a bond issue of $50,000,000 for the construction of a State highway system and in 1912 another $50,000,000 was authorized, although the latter was in part for maintenance. In 1918, the voters of Illinois authorized a $60,000,000 bond issue to provide for a carefully laid out State system of highways In the same year, Pennsylvania provided for a $50,000,000 road bond issue. In 1919, California voted a $40,000,000 bond issue for roads, making the third issue for this purpose, with a total of $73,000,000. In 1920, Minnesota, Missouri, and West Virginia voted $75,000,000, $60,000,000, and $50,000,000, respectively. Since that date a number of other large bond issues have been voted in different States, including $60,000,000 in Arkansas in 1923. In November, 1924, Illinois will vote on an additional road bond issue, this time of $100,000,000. To a large extent the State bond issues go to meet the Federal-aid requirement that the States provide at least half the cost of roads toward which the Federal government contributes. In addition, the States must take the initiative as to routes and other planning, let and supervise contract work, and after construction maintain the roads to the satisfaction of the government or else subject themselves to denial of Federal aid in the future.

All the State work done under the Federal Aid Act is subject to the approval of the United States Bureau of Public Roads acting for the Department of Agriculture. The Federal Aid Road Act of Nov. 9, 1921, which has been the basic act for Federal aid, requires each and every State receiving Federal aid to lay out, in conjunction with agents for the Federal government, a State highway system which must be so planned as to provide for interstate connection. The Federal aid roads in each State must not exceed 7 per cent of the total highway mileage of the State and upon these roads all Federal aid apportionments must be expended. The State highway systems so laid out are divided into primary and secondary roads, the primary not to exceed three-sevenths of the total.

The act of 1921 provided that the several States must certify the mileage of their highways as of Nov 1, 1921—which proved to be a total of 2,866,061 miles. After coördination by means of conferences between the Bureau of Public Roads and groups of adjacent States, the bureau named recommended a road map of the United States to the Secretary of Agriculture This map was published Nov 1, 1923, and included 168,881 miles, which is 5.9 per cent of the mileage certified as of Nov. 9, 1921.

According to a statement submitted to a congressional committee by Thomas H. MacDonald, chief of the United States Bureau of Public Roads, up to Mar. 1, 1924, there had been completed, since the Federal Aid Road Act of 1916 went into effect, a total of 33,036 miles of road

MILEAGE AND AVERAGE COST PER MILE OF FEDERAL AID ROADS COMPLETED TO MAR. 1, 1924 [a]

Types	Miles		Average	
	Number	Per cent	Total cost Amount	Per mile Per cent
Graded and drained	6,677	20.2	$7 658	9 0
Sand clay	3,507	10.6	7 247	4,5
Gravel	13,019	39 4	9 842	22.6

* Includes projects reported completed (final vouchers not yet paid) totaling: estimated cost, $49,154,309 22; Federal aid, $21,750,040.45; miles, 2,289.9.

under the Act and on the same date 13,800 miles additional were under construction and reported as 59 per cent complete. This made a total of 46,836 miles completed or being built on Mar. 1, 1924 Estimates of the mileage of improved highways built without Federal aid indicate that these roads, combined with the Federal road mileage improved or under construction, would bring the total up to 60,000 miles of surfaced roads, leaving about 110,000 miles of the Federal-State system yet to be surfaced. The total estimated cost of the mileage completed and under construction is $844,489,300, of which $372,721,900 is from the Federal aid fund The table on page 1128 shows the distribution of the 33,036 miles of road actually completed by types of surfacing and also gives the average total cost per mile for each type.

The original Federal Aid Road Act approved July 11, 1916, authorized Federal aid to the extent of $5,000,000 for the fiscal year 1917, with increases of $5,000,000 a year for the next four years, when the amount authorized was $25,000,000. The second Federal Aid Act (Feb. 28, 1919) provided an additional sum of $50,000,000 for the fiscal year 1918-19 and $75,000,000 each for the next two fiscal years, thus increasing the total authorized Federal contribution to $65,000,000 for 1918-19; $95,000,000 for 1919-20, and $100,000,000 for 1920-21. The revised programme for Federal aid, which became a law Nov. 9, 1921, provided $75,000,000 for the fiscal year 1921-22 The Federal aid programme was continued by legislation of 1922 so as to authorize Federal aid to the extent of $50,000,000 for 1922-23; $65,000,000 for 1923-24, and $75,000,000 for 1924-25. The sums authorized and actually becoming available by allotment vary materially year by year owing to a variety of conditions, the essential one of which is that the States have to meet certain conditions of the Federal Aid Road Act before money can be allotted to them by the Secretary of Agriculture under the recommendation of the Bureau of Public Roads The actual sums available for new construction, the cost of the Federal aid road work put under construction and the mileage of road built during the several fiscal years since Federal aid was established are shown by the accompanying table.

ways in the United States since 1904 was set forth in a statement by Mr. MacDonald before a congressional committee on Mar. 1, 1924. The figures available before those for the year 1921 were scanty and apparently were largely estimated. From 1904 to 1914, the "total income for all rural road purposes" increased from about $79,500,000 to $240,250,000, or 202 per cent. The earlier total includes an estimated value of about $20,000,000 in "statute labor" ("working out the road tax"). Mr. MacDonald believed that in 1914 "statute labor" was negligible, the inefficiency of this system of road construction having become generally recognized by that time. The total disbursements in 1921 for highway purposes by States, counties, townships, and districts amounted to $1,036,588,000, of which $623,346,110, or 60 per cent, were local, and $413,241,662, or 40 per cent, State contributions The total sum regardless of origin was distributed as follows: for "construction," $626,965,000, or 60 5 per cent; "maintenance," 24 per cent, and payment of principal and interest on highway bonds, 8.6 per cent. Complete data for 1922 were not available, but indicated a corresponding total expenditure of $1,011,000,000. At the beginning of 1923 the various States reported that $943,340,000 was available for highway work during the year. The figures thus far given in this paragraph do not take into account Federal aid. Taking Federal aid into account the total income for all rural road purposes from Federal, State, county, township, and district governments for the year ending Dec. 31, 1921, was $1,149,437,896, distributed as follows:

	Amount	Per cent
Bonds	$438,109,273	38 1
Federal and forest road aid	79,333,226	6.9
Motor vehicles fees $118,942,706		
gasoline tax 3,683,460	122,626,166	10.6
General property taxes	415,680,010	36 2
All other sources	93,689,221	8 2
Total	$1,149,437,896	100.0

(For distribution of Federal aid funds by States, mileage built by States under Federal aid, and many other details, see various annual reports of the United States Bureau of Public Roads.) How far the expenditures on rural roads exceed those for city streets is indicated by the fact that figures given by Mr. MacDonald show that against the $1,037,000,000 expended on rural roads during the year 1921, for streets in urban places of a population of 2500 and over that reported (2267 out of a total of 2788) there was spent slightly over $332,000,000 (presumably for construction and general maintenance) and $51,000,000 on street cleaning and lighting.

FEDERAL AID AVAILABLE, COST OF WORK UNDER CONSTRUCTION AND MILES OF ROAD BUILT [a]

Year	Available for New Construction	Put Under Construction During Fiscal Year	Miles of Road Built
July 1, 1917	$ 4,850,000		
1918	14,550,000	$ 3,144,387	13
1919	74,456,000	19,344,675	177
1920	147,261,000	81,436,032	1,493
1921	162,825,000	81,366,057	5,787
1922	154,584,000	56,777,810	10,247
1923	146,556,000	77,492,872	8,820
1924	132,438,000	91,000,000 [b]	6,500 [c]
1925	114,563,000	94,000,000 [b]	.....

[a] Official Statement by Bureau of Public Roads, Mar. 1, 1924.
[b] Estimated. [c] First 8 months of the year only.

Expenditures for Rural Highways. The immense increase in expenditures for rural high-

British Isles. The total mileage of roads and streets in England, Wales, and Scotland, ac-

cording to a "revised classification, 1923-24," is given as 177,321 in *The Empire Municipal Directory and Year Book*, 1924-25 (London). Of these 23,230 miles are listed as Class I and 14,739 miles as Class II, a distinction not defined. For England and Wales the total road mileage is 152,410, thus divided: County Council (a) main roads, 28,764 miles, and (b) district roads, 110,928, making a combined total of 139,693 miles; County Boroughs, 10,560 miles; Metropolitan Boroughs and London County Council, 2158 miles. The Scottish total of 24,911.6 miles is divided into 23,948.4 in counties and 963.2 in burghs.

Canadian Road Construction. Canada, in 1921, authorized $20,000,000 of Dominion aid to provincial road construction, available during five years. The Dominion Commissioner of Highways reported that in 1922 there had been put under construction 5786 miles of improved roads in Canada at a cost of $40,000,000 to the Dominion and provinces.

Materials and Design. The leading materials used in the construction of both rural improved road surfaces and city pavements did not change much in the interval between 1914 and 1924, but there have been marked changes in the relative extent to which the various types of pavement are employed as well as in the various elements of design, both to meet changes in burden upon road surfaces and pavements due to the shift from horsedrawn to motor vehicles, the rapidly increasing number and weights carried by the latter. A world-wide view would show that many large and important countries of the world still have practically nothing but dirt roads and rude trails. Even in the United States and some other highly civilized countries, by far the larger percentage of the total mileage of highways still remain with only the natural earth as the surface over which the vehicles pass or at best have been improved with gravel surfacing.

In the cities of the United States and many other civilized countries there is still a considerable percentage of dirt streets and much gravel or waterbound macadam surfacing, neither of these surfacings being fit to stand heavy traffic. For both rural highways and city streets where macadam is still being put down, the waterbound macadam is being superseded by bituminous-bound. Concrete in both country and city is being used more and more extensively for pavements and rural highway surfaces, with steel reinforcement under the heaviest loading in some cases. Such surfacing is used quite extensively in some parts of the country, for both rural roads and city streets, the degree of use depending considerably upon proximity to paving-brick centres of manufacture. Sheet asphalt surfacing is still in high favor for city streets in some sections of the country. For very heavy traffic city streets granite blocks are still extensively used, but their greater roughness as compared with other readily available pavements is against them. Creosoted wood-block pavement has not made the progress indicated some years ago, owing in part to difficulties experienced with swelling and heaving under some conditions and also to the increased cost of the best classes of material for wood-block pavement.

Standardization. Standardization in paving material and construction has made marked progress. Standard specifications for various kinds of paving have been framed by committees of the American Society of Municipal Improvements and adopted by the society on letter ballot. Through the coöperation of the United States Department of Commerce, road and paving engineers and manufacturers of the varieties of paving brick were reduced from 66 to 7 in 1922, then to 6 in 1923 and to 5 early in 1924. Likewise grades of asphalt, used for paving, were reduced in number from 88 to 9 in 1923, as based on the penetration test used to show relative hardness.

Cleaning and Snow Removal. For machine cleaning of streets, motor-driven vehicles with or without pick-up attachments are increasing in degree of use. Hand cleaning is still considered to have material advantages but lessens in importance with the diminishing extent of use of horses. Snow removal both from city streets and from long stretches of rural highway is becoming increasingly common to meet the demands of motor-vehicle traffic. Snow plows and sweepers are employed, together with mechanical means of loading the snow into motor or other vehicles for being carted away.

Bibliography. Recent new books or revised editions of important old ones include: Harper and Bonney, *Handbook for Highway Engineers* (New York); Blanchard, *American Highway Engineers' Handbook* (New York); Harger, *Location, Grading and Drainage of Highways* and also *Rural Highways* (New York); Agg, *Construction of Roads and Pavements* and also *American Rural Highways* (New York); Baker, *Roads and Pavements* (New York); Boulnois, *Modern Roads* (London); Besson, *City Pavements* (New York); Chatburn, *Highways and Highway Transportation* (New York); White, *Motor Transportation of Merchandise and Passengers* (New York); Holt, *The Bureau of Public Roads* (Washington), No. 26 of *Service Monographs* of the United States government. See also CITY PLANNING.

ROBERTS, KENNETH LEWIS (1885-). An American writer, born at Kennebunk, Me., and educated at Cornell University. From 1909 to 1917 he was a reporter and special writer on the Boston *Post*. In 1915-18 he was a member of the staff of *Life* (New York). In the War he served as captain of the Intelligence Section of the Siberian Expeditionary Force and from 1919 to 1921 was foreign correspondent in Central Europe and the Balkans for the *Saturday Evening Post*, and Washington correspondent for the same magazine from 1921. He wrote *Europe's Morning After* (1921); *Why Europe Leaves Home* (1922); and other books.

ROBERTSON, SIR WILLIAM ROBERT (1860-). A British soldier. He was quartermaster-general at the outbreak of the great War and in that office did efficient service in outfitting troops sent to France. In 1915 he was appointed Chief of the General Staff of the British Expeditionary Force and from 1915 to 1918 was Chief of the Imperial General Staff. In February, 1919, he was appointed to the eastern command and became general officer in June of that year, with command of troops in Great Britain. In 1919-20 he commanded the Rhine Army in Germany. He was created a baronet in 1919 and became a field-marshal in 1920. He received many decorations and honors. In 1922 he published a volume of reminiscences.

ROBIN, LÉON (1866-). A French

philosopher and classical scholar, born at Nantes, and educated at the Sorbonne. He taught at the Collège de Compiègne and the Lycées of Vendôme and Angers and was made professor at the Sorbonne in 1918. His first publication on the Platonic theory of ideas and numbers, according to Aristotelian sources, gave him an international reputation. His other works include *La Théorie Platonicienne de l'Amour* (1908) and *Etude sur la Signifiance et sur la Place de la Physique dans la Philosophie de Platon* (1919). He was also the author of studies published in the *Revue Philosophique*, the *Revue de Métaphysique* and the *Revue des Etudes Grecques*.

ROBINS, RAYMOND (1873–). An American social economist (see VOL. XX) In 1916 he was chairman of the Progressive National Convention and also leader of the national Christian evangelistic social campaign in American universities and colleges (1915–16). He was Commander of the Red Cross Mission to Russia in 1917 and 1918.

ROBINSON, EDWIN ARLINGTON (1869–). An American poet (see VOL XX). He continued to produce poetry of high merit during the decade 1914–24. His later books include two plays, *Van Zorn* (1914) and *The Porcupine* (1915). He wrote also *The Man Against the Sky*, poems (1915); *Launcelot*, a poem (1920); *The Three Taverns*, poems (1920); *Avon's Harvest*, poems (1921); and *Collected Poems* (1921)

ROBINSON, JAMES HARVEY (1863–). An American educator and author (see VOL. XX). He was professor of history at Columbia from 1895 to 1919, when he resigned to organize and lecture at the New School of Social Research in New York City From 1911 to 1920 he was associate editor of *The American Historical Review*. His later books include *Mediæval and Modern Times* (1915); and *The Mind in the Making*, (1921). The latter, a remarkable study of the development of the human intellect, contained many radical theories which caused much discussion. It was one of the most widely read nonfiction books published in many years.

ROBISON, SAMUEL SHELBURNE (1867–). An American naval officer, who graduated from the United States Naval Academy in 1888. He served during the Spanish-American War and filled many important posts on land and at sea. He was with the Bureau of Equipment in 1909–10 and with the Bureau of Steam Engineering in 1910–11. In 1917–18 he was commander of the submarine force of the Atlantic Fleet and in 1918–19 a member of the Naval Armistice Commission. In 1919 he was commandant of the Navy Yard in Boston, and from 1920 military governor of San Domingo. He was promoted to be rear-admiral in 1918.

ROBISON, WILLIAM FERRETTI (1871–). An American clergyman and educator, born at St. Louis, and educated at the University of St. Louis and at St. Stanislaus Seminary. He joined the Society of the Jesuits in 1887 and was ordained to the priesthood in 1902 He taught in several institutions and in 1906–09 was vice president of the University of Detroit. President Robison was appointed professor of ethics and natural law at St. Louis University in 1909 and became its president in 1920. Besides being the author of *Christ's Masterpiece* (1918), *His Only Son* (1918), and *The Undying Tragedy* (1919), he was widely known as a pulpit orator and lecturer.

ROCHESTER. The third city in size in New York State. The population increased 34.4 per cent from 220,087 in 1910 to 295,750 in 1920 and to 317,867 by estimate of the Bureau of the Census for 1923. Work was begun in 1922 on transforming the dry bed of the Erie Canal into a freight and passenger subway carrying trolley tracks and railroad tracks connecting lines formerly quite distinct. Eight and one-half miles of the canal were laid with track; of this, one mile in the heart of the city was covered over and a street built above it, parallel to and relieving the congestion of Main Street. The old aqueduct which formerly carried the canal over the Genesee River was reconstructed to carry both the subway and the street. The completed work was to cost about $6,000,000. A city planning bureau was created in the office of the city engineer in 1917 The superintendent in charge, who was appointed by the city engineer, had power to make a city plan, to pass on all plotting for the opening, widening, or extension of streets, and to establish building zones. In 1922, the Eastman theatre, the third largest in the United States, was built on a bequest from Mr. George Eastman, for public use under the management of the Eastman School of Music of the University of Rochester. The number of manufacturing establishments increased from 1400 in 1915 to 1700 in 1924, and the wages paid from $29,252,000 to $110,000,000. The total capital invested increased from $95,708,000 in 1915 to $200,000,000 in 1924. The customs receipts rose from $321,914 in 1914 to $786,505 in 1922. In the latter year imports were valued at $5,413,338 and exports at $8,176,443.

ROCHESTER, UNIVERSITY OF. A coeducational, nonsectarian institution at Rochester, N. Y., founded in 1850. The student enrollment increased from 531 in 1915 to 783 in the year 1923–24. The faculty increased from 45 to 69 in the same period, and the library from 66,000 to 100,000 volumes. Mr. George Eastman gave $4,500,000 to found the Eastman School of Music which was opened in 1921 with an endowment of $2,234,509. In 1921, he gave $4,000,000 to found a School of Medicine and Dentistry, and the General Education Board gave $5,000,000 for the same purpose. The school was in process of organization in 1924, and was expected to be opened to students in the fall of 1925. The university received $673,350 from the estate of L. P. Ross in 1917 to found the department of vital economics. It conducted a campaign in 1919 for $1,000,000 additional endowment to be used to cancel indebtedness contracted during the war years to the amount of $60,000, to add $100,000 to the library fund, and to increase the salaries of professors. Friends of the university proposed to conduct a campaign in 1924 to secure $10,000,000 to provide for building a new college for men on a site adjacent to the new Medical School property and to provide for $5,000,000 additional endowment. The old campus was to be used for a women's college. President, Rush Rhees, D.D., LL.D.

ROCKEFELLER, JOHN DAVISON, JR. (1874–). An American capitalist (see VOL. XX). He continued active in business and philanthropy during the decade 1914–24. As director of the Colorado Fuel and Iron Company, he encountered labor troubles in its mines. He had a careful investigation made in the in-

dustrial troubles there, and largely as a result of his efforts peace was restored. He contributed large sums of money to various causes and was especially active in church and Sunday school activities

ROCKEFELLER FOUNDATION. An organization chartered by special act of the New York Legislature on May 14, 1913. While the chartered purpose is broadly stated as "the well-being of mankind throughout the world," the work of the Foundation has become chiefly centred on public health and medical education. The expenditures during the first decade, 1913 through 1922, have amounted to $76,757,040, roughly divided as follows: public health, $18,188,838; medical education, $24,716,859; war relief, $22,298,541; all other philanthropic work, $10,445,628; administration, $1,107,174. In carrying on its various activities, the Foundation expended all its income from year to year, and in addition $17,500,000 of its general fund or principal. A further sum of $15,500,000, payable in future years, was pledged to various medical schools and public health projects. Contributions outside the field of public health and medical education were made, for the most part, during the War and in the earlier years of the Foundation's work before its policies and programme had become clearly defined. The chief item in this group is the sum of $5,678,599 given to various charities designated by the founder before he relinquished on July 19, 1917, the right which he had originally reserved to direct personally the use of a part of the income. A million dollars was given to Herbert Hoover's relief work in Europe and another million to make possible the Palisades Interstate Park.

The International Health Board, established as a department of the Foundation in 1913, sought to promote public health throughout the world by demonstrating methods and costs of controlling certain diseases, notably hookworm disease, malaria, and yellow fever; by fostering the growth of governmental health agencies; and by encouraging the formation of schools of hygiene. In carrying out this programme, the Board coöperated with 27 American States and 50 foreign governments. Its annual expenditures increased from $133,237 in 1914 to $1,842,249 in 1922. In medical education a special feature was the work of the China Medical Board, in building, equipping, and maintaining a modern medical centre in Peking. The Board made appropriations to other medical schools and to 32 hospitals, as well as to the fostering of scientific education in China. Substantial contributions were more recently made to centres of medical teaching in London and Brussels. The Foundation has also coöperated in the development of medical education in North and South America, western and central Europe, the Philippines, Hong Kong, and Bangkok. See MALARIA; YELLOW FEVER.

ROCKEFELLER INDUSTRIAL REPRESENTATION PLAN. See LABOR ARBITRATION.

ROCKFORD COLLEGE. A nonsectarian college for women, founded in 1849 at Rockford, Ill. The student enrollment increased from 242 in 1914 to 372 in 1923–24, plus 121 students in the afternoon and evening courses, the faculty was increased from 39 to 45 members, and the annual income from all sources from $109,391 to $225,000. In 1920, a system of afternoon and evening courses for non-matriculated adult students, especially teachers, was inaugurated; and in 1923, a department of religious education was established. The salaries of the instructors rose from $35,000 in 1919 to $95,000 in 1923–24. In 1923, the Hobart W. Williams Student Aid Trust Fund of $200,000 and the Beattie Student Aid Fund were received by the college. It was also engaged in raising $160,000 in 1924 to satisfy the conditions of a gift of $135,000 from the General Education Board; the completed endowment was to be $850,000. A new dormitory with swimming pool was built. William Arthur Maddox, PH.D., was inaugurated as President in 1919.

ROCKS. See GEOLOGY.

RODIN, AUGUSTE. See SCULPTURE, *France*.

RODMAN, HUGH (1859–). An American naval officer, born in Frankfort, Ky., and graduated from the United States Naval Academy in 1880. He served in the Spanish-American War and afterward performed many important services on shore and afloat. In 1916 he was appointed a member of the General Board of the Navy Department, and in the year following commanded the 3d Division of the Atlantic Fleet. In November, 1917, he was appointed commander of the 9th Division of the battleship force and with it served in the British Grand Fleet. For a year he was commander of the 6th Battle Squadron of the British Grand Fleet in the North Sea. In 1919 he was commissioned admiral and commander-in-chief of the Pacific Fleet. He received decorations and honors from several foreign governments.

ROGER-DUCASSE, JEAN-JULES (1875–). A French composer, born at Bordeaux. He studied composition under G. Fauré at the Paris Conservatoire and won the second Prix de Rome in 1902. After 1909 his works figured prominently in concerts in Paris and won favor outside of France. He is one of the neoclassicists whose works rest on the solid foundations of the classic masters, with slight impressionistic coloring. He wrote a ballet, *Orphée* (Paris, 1913); for orchestra, *Variations Plaisantes sur un Thème Grave, Suite Française, Prélude, Petite Suite, Prélude d'un Ballet, Le Joli Jeu de Furet* (scherzo), and the symphonic poems *Sarabande* (with solo voice), *Au Jardin de Marguérite* (with soli and chorus), *Nocturne de Printemps* and *Epithalame; Sur Quelques Vers de Vergile* for chorus and orchestra; a string quartet and a piano quartet; several motets; and piano pieces.

ROGERS, ROBERT WILLIAM (1864–). An American Orientalist (see VOL. XX). He was instructor at Columbia University summer sessions (1915–21) and professor at Princeton and Drew Theological Seminary. His later works are: *History and Literature of the Hebrew People* (1917); *Great Characters of the Old Testament* (1920); and *Old Testament Lessons* (1921).

ROGERS, WILL (1879–). An American actor, orator, and writer, educated at the Kemper Military School at Boonville, Mo. He made his first appearance on the stage at Keith's Union Square Theatre in New York City in 1905. His principal successes were made with the *Ziegfeld Follies*, with which he became associated in 1907. He is also well-known as an after-dinner speaker and journalist. In 1924 he covered the meetings of the Democratic national convention very cleverly for the New York *Times*.

ROHLFS, ROLAND (1892–). An American airplane pilot, born in Buffalo, N Y He was taught to fly by Victor Carlsrom. He was in charge of Curtiss Field in Buffalo for a year and experimental test pilot for four years In 1922 he held the seaplane speed record and that of climbing 20,000 feet in 10 minutes. He made many altitude flights almost equaling the world's record.

ROHRBACH, PAUL (1869–). A German writer (see VOL. XX). Among his works published in the decade 1914–24 are: *Die Geschichte der Menschheit* (1914); *Russland und Wir* (1915); *Weltpolitisches Wanderbuch* (1915); *Das Baltenbuch* (1917); *Woher Es Kam* (1919); *Politische Erziehung* (1919); *Die Beweise fur die Verantwortlichkeit der Entente am Weltkrieg* (1920); and *Gottes Herrschaft auf Erden* (1921)

ROLLAND, ROMAIN (1866–). A French writer (see VOL. XX). He received one-fourth of the Nobel Prize in literature in 1915, following the completion of his great novel, *Jean-Christophe.* During the War his pacifism, expressed in *Au-dessus de la Mêlée* (1915), incurred the displeasure of the French people, and he withdrew to Switzerland. His popularity returned after the War, and he published several novels which further increased his reputation. Other writings included articles on Gandhi, the Hindu Nationalist leader, for *The Century Magazine.*

ROLSHOVEN, JULIUS (1858) A painter and teacher, born at Detroit, and educated at Cooper Union and the Plassman Academy in New York City. He also studied with Hugo Crola at Düsseldorf Academy, with Loefftz at Munich, in Frank Duveneck's class at Florence, and in the Atelier Toney in Paris; Robert Fleury and Bouguereau were among his teachers in Paris. He founded the Rolshoven life classes in Paris and London with international attendance and was awarded honors and medals in Munich, Paris, Brussels, Chicago, Berlin, Buffalo, St Louis, and Florence "The Chioggia Fishing Girl" and two of his etchings are in the Cincinnati Museum, and "The Refectory of San Damaino, Assisi," is on exhibition at the Detroit Institute

ROMAINS, JULES ("LOUIS FARIGOULE") (1885–). A French man of letters, educated in the French universities. He became professor of rhetoric at a provincial lycée. In the meantime, under his literary pseudonym, he acquired a reputation as one of the most vigorous writers of the younger generation He accepted the label *Unanimiste* to denote the school of writing which he championed. This appellation implied an all-pervading sympathy and participation in the "collective consciousness" of the sociologists. Romains is the author of the following volumes of poetry: *Europe; Le Voyage des Amants; Amour, Couleur de Paris; Un Être en Marche; Odes et Prières; La Vie Unanime;* and *L'Armée dans la Ville.* His prose works and novels include: *Les Copains; Donogoo-Tonka, ou les Miracles de la Science; Le Bourg Régénéré; Puissances de Paris; Lucienne; Mort de Quelqu'une;* and *Sous les Quais de la Villette.* In addition he wrote two plays, *Cromedeyre-le-Vieil,* and *M. Le Trouhadec Saisi par la Débauche.*

ROMAN CATHOLIC CHURCH. Three Popes reigned in the decade 1914–24. The gentle, spiritual, peasant pontiff, Joseph Sarto, whose aim was "to restore all things in Christ," died of a broken heart in August, 1914, when the War brought international chaos. Giacomo Della Chiesa, "the Peacemaker," was elected his successor on Sept. 3, 1914; he combined the grace of his predecessor with the statesmanship of the great Leo XIII and adopted the ideals and policies of both Almost immediately he began a series of encyclicals and appeals to the warring powers to end their strife, and during the seven years of his administration he never relaxed his efforts to restore peace and concord among the nations. His Christmas address to the cardinals in 1921 on the five great social plagues of the world gained immediate and universal attention and praise. His success in renewing diplomatic relations between the Vatican and England, France, Holland, Portugal, Poland, Finland, Luxemburg, Serbia, and Monaco, and the advances for the healing of the breach between the Eastern and Western Churches were notable. The internal affairs of the Church received his constant attention. Among the special results were the promulgation of the new Code of Canon Law (June 28, 1917) and the encyclicals on preaching; True Family Life; the Bible; Dante; and Social Welfare Work. The revocation of the rule in regard to visits of foreign officials to the Quirinal, which was followed by the ceremonial calls at the Vatican of the rulers of Spain and England (1923) and President Wilson (Jan. 4, 1919); the promotion of the canonization of Joan of Arc, Louise de Gras, Margaret Mary Alocoque, Gabrielle dell' Addolorata, Oliver Plunkett, and others of the beatified; and measures for the reorganization of the demoralized church in Poland, Austria, Germany, and Russia, and the missions of the Far East were other accomplishments. His official acts followed each other so swiftly that their full influence and significance were barely appreciated when he died on Jan. 21, 1922.

The American cardinals were too late to vote at the conclave that elected Cardinal Achile Ratti his successor as Pius XI. Cardinal Farley by accident was in Europe when Benedict XV was elected and so was the only American cardinal who ever voted for a Pope. This, however, will not happen again, for by order of Pius XI, the time limit for the opening of the conclave has been extended to 15 days to enable the foreign cardinals to arrive in Rome. The new Pope, understanding English and having intimate family and social connections with America, and having lived in England and acted as a diplomat in central Europe, was especially well equipped to take up the renewed appeal for a peaceful adjustment of the discord of the nations on a basis of justice, not force. His wide experience as a student and critical historian was frequently shown in his discourses and encyclicals, notably those on St. Francis de Sales (Jan. 30, 1923); St. Thomas (June 29); St. Bernard, (August 20); St. Columbanus (August 4); Sœur Thérèse, "the Little Flower" (February 11); the Jesuit Robert Bellarmine (May 19); and the letter of thanks to the American hierarchy (September 8) for their aid to the Papal Relief Expedition to Russia. This expedition he put in charge of the American Jesuit, the Rev. Edmund A. Walsh, Regent of the School of Foreign Service at Georgetown University. It distributed more than $1,000,000 until its operations ceased because of the attempt of the

Bolsheviks to use it to force the Vatican to recognize the Soviet government (November 1923). Pius XI took occasion on November 14 and Dec., 10, 1923, to reaffirm his great interest in the reconciliation of the churches of the Eastern rites, and officially announced a projected reopening of the Vatican Council of 1869 and that the Holy Year would be proclaimed on Dec. 30, 1924, as the twenty-second general jubilee. The year closed with the encyclical permitting the acquiescence of the French Episcopate in the new association laws which make the position of the church in France more stable in the eyes of the law and therefore more satisfactory.

In August, 1917, the Catholic hierarchy organized the National Catholic War Council to promote the spiritual and material welfare of Catholics in the service of the government and to direct and assist all Catholic activities incidental to the War. It coördinated the efforts of 9714 Catholic men's and 4959 Catholic women's organizations for this purpose. When hostilities ceased, this body was continued as the National Catholic Welfare Council, at a meeting of the hierarchy held on Sept. 24–25, 1919, from which was issued a pastoral letter setting forth the problems of necessary social reconstruction As the name chosen for the body was open to a misinterpretation in a strictly canonical sense it was changed in the following year, on advice from Rome, to the National Catholic Welfare Conference, under which title it continued its work for social action, education, immigration welfare, and the proper and advantageous solution of other industrial and economic problems affecting the Catholic population, and which are discussed at annual meetings of the bishops held in Washington. On Nov. 27, 1917, Cardinal Hayes, then bishop auxiliary of New York, was appointed by the Pope chaplain bishop of all the United States forces and so served during the War. He had under his jurisdiction, when the Armistice was signed, 1023 chaplains in active service and 500 approved in the reserve list. The Catholic quota allowed by the government was 37.8 per cent of the whole corps.

The welfare work in the camps was in the hands of the Knights of Columbus who were given funds for war service work to the amount of $43,000,000, and expended in this cause, from June 16, 1917, to Oct. 7, 1923, a total of $37,250,000. The balance was being devoted to social reconstruction work and education and care for disabled service men. The membership of the Knights of Columbus grew to 770,324, organized into 2399 separate councils (1923–24).

The Hierarchy. The official data of the Catholic hierarchy given in the *Annuario Pontifico* for January, 1924, states that there were then 65 cardinals, 8 patriarchs, 335 archbishops, 1354 bishops (of whom 480 were titulars), 18 delegates apostolic, 191 vicars apostolic, and 68 apostolic prefects. All these were of the Latin rite. Belonging to the various Oriental rites were 6 patriarchs, 22 archbishops, 49 bishops, and 6 vicars apostolic. The increases since the election of Pope Pius XI were 2 archbishoprics, 7 episcopal sees, 23 apostolic prefectures, 20 apostolic vicariates, and 1 apostolic delegation. Of the cardinals, 34 were Italians and 33 of other nationalities. Eight countries had ambassadors at the Vatican, and 26 were diplomatically represented there. In 1913 there had been only 13 so represented. Sixty cardinals died during the decade 1914–24; the list includes such familiar names as Gibbons, Farley, Falconio, Martinelli, Serafino Vannutelli, Ferrati, Van Kopp, Gotti, Netto, Amette, Ferrari, Dubourg, and Agliardi. The new creations were 49, among them Dougherty of Philadelphia, Sbaretti, Schulte, Ratti (Pope Pius XI), Dubois, Begin of Quebec, and Laurenti.

In the United States 54 new bishops were appointed, and 46 died. Five new dioceses, El Paso, Grand Island, Kearney, Lafayette, and Springfield (Ill.) were organized. The older generation of the hierarchy disappeared in the passing away of Cardinals Gibbons and Farley; Archbishops Riordan, Quigley, Spalding, Blenk, Prendergast, Keane, and Kennedy, rector of the American College; and Bishops McFaul, Chatard, Hennessy, Beaven, Foley, Harkins, McDonald, O'Gorman, Kudelka, Donahue, Burke, Gabriels, Ryan, and Byrne. Most of the new bishops were comparatively young men. A radical departure in the selection of candidates for vacant American sees was enacted by the Pope (1916). The old procedure of voting for three names at diocesan convocations was abolished; a permanent list of eligibles was to be filed in Rome every two years, made up of names submitted by the bishops of the United States of those they regard as most worthy to be their successors.

Archbishop Fumasoni-Biondi assumed the office of apostolic delegate at Washington (Mar. 6, 1923), in succession to Mgr. Bonzano, who was created a cardinal, and Archbishops Dougherty, Shaw, Mundelein, Hayes, Curley, and Daeger were added to the Metropolitans.

Statistics. *The Official Catholic Directory* for 1924 gives these statistical totals for the United States: 17 archbishops of whom 2 are cardinals (2 more cardinals have since been added); 98 bishops; 23,159 churches with 17,146 priests; 105 seminaries with 9328 students; 934 colleges and academies; 6388 parish schools, with 1,988,376 children cared for; 316 orphan asylums with 48,976 inmates; and a grand total for the Catholic population of 18,559,787.

These figures, compared with those for the year 1914, indicate a decennial increase of 2,250,477 in population; 9151 priests; 2185 churches; 900 parish schools, with 532,170 children cared for; 20 seminaries and 2558 students; 25 colleges and academies; and 32 orphanages, with 3234 inmates.

Frequent complaint was made that owing to faulty and unscientific methods of computation, this total of the Catholic population is an under estimate. Archbishop Canevin of Pittsburgh, who made an exhaustive study of the subject in 1922, contended that the total should be 22,733,254. Other authoritative statisticians who have since analyzed the table which he made out agree with him. Seventy per cent of the Catholic population is in 12 States, and the remaining 30 per cent is widely scattered over the others. There are 2230 congregations made up of non-English-speaking people.

The *Catholic Directory* for England for 1924 gives the Catholic population of the world as 324,328,408. In 1914 it was estimated as 301,172,712. The Catholics of the British Empire number 14,827,312, and the grand total for English-speaking countries is 42,856,094.

THEODORE ROOSEVELT

RÖNTGEN RAYS. See ALBERS-SCHÖNBERG, HEINRICH ERNST.

ROOSEVELT, FRANKLIN D(ELANO) (1882–). An American lawyer and public official, born at Hyde Park, N. Y., and educated at Harvard University and the Columbia University Law School. In 1907 he was admitted to the bar. He was active in Democratic politics and a member of the State Senate in 1910 but resigned in 1913 on his appointment as Assistant Secretary of the Navy, which he held until 1920. In that year he was Democratic nominee for vice president. During the War he acted as inspector of the United States naval forces in European waters and was in charge of demobilization in Europe in 1919. Although not an active candidate in the Democratic convention of 1924, he was prominent in the proceedings of that body.

ROOSEVELT, THEODORE (1858-1919). A former President of the United States (see VOL. XX). In 1914 he conducted an exploring expedition in Brazil, where he endured many hardships. The most spectacular episode of this journey was the descent of the so-called River of Doubt, which had hitherto been practically unexplored. This river was renamed for him the Rio Teodoro. At the outbreak of the War his sympathies with the Allies were emphatically and repeatedly expressed. He strongly denounced the policy of strict neutrality laid down by President Wilson and pointed out the danger to the United States if Germany won. In 1916 he supported Charles E. Hughes for President As soon as the United States had declared war, he offered to raise a division and to lead it into France. President Wilson refused this offer on the ground that it would be inexpedient to give a civilian practically inexperienced in large military operations such an important command. All of his four sons served during the War. Theodore, Jr., with the infantry in France, rose to the rank of lieutenant-colonel. Kermit served with the British Royal Artillery in Mesopotamia until he was transferred in July, 1918, to the American artillery in France Archibald rose to the rank of captain. Quentin, the youngest, entered the Air Force and was killed in an air fight in July, 1918. After a short illness, Theodore Roosevelt died in his sleep, on Jan. 6, 1919 Following his death, many books relating to him were published. These included his letters to his children and to others and many reminiscences. He published in 1916 *A Booklover's Holiday in the Open.*

ROOSEVELT, THEODORE, JR. (1887–) An American public official, born at Oyster Bay, N. Y., the son of Theodore Roosevelt. He was educated at Harvard University. He was for several years engaged in business but at the outbreak of the War was commissioned major of the 26th Infantry, United States Army. He was promoted to be lieutenant-colonel in September, 1918. He took an active part with his regiment in campaigns in France, including the Meuse-Argonne and the St. Mihiel offensives. He received the Distinguished Service Cross and the Croix de Guerre. In 1919 he was active in the organization of the American Legion. He was elected to the New York Assembly in 1919 and served for one year. In 1921 he was appointed Assistant Secretary of the Navy.

ROOT, ELIHU (1845–). An American statesman (see VOL. XX). In 1917 he headed a special diplomatic commission sent by President Wilson to Russia. He formulated the plan for the Permanent Court of International Justice, established in 1921 He was Commissioner Plenipotentiary for the United States at the Disarmament Conference. In 1918 he became chairman of the United States Government War Savings Investment Society. His later writings include: *Addresses on International Subjects* (1916); *Addresses on Government and Citizenship* (1916); *Military and Colonial Policy of the United States* (1916); *Latin-America and the United States* (1917); *Russia and the United States* (1917); and *Miscellaneous Addresses* (1917).

ROOTS. See BOTANY.

ROPSHIN, V. ("BORIS SAVINKOV") (? –). A Russian novelist. He was formerly a Terrorist and one of the leaders of the Social-revolutionary party but afterward began a bitter fight against the Bolsheviks. He wrote two problem novels on the Terror which are interesting both in material and style They are better finished than most of the novels of that sort written during the period of the Terror. His style has been compared to that of Tolstoy. His novels include *The Pale Horse* (1909) and *What Never Happened* (1912).

ROSENAU, MILTON JOSEPH (1869–). An American physician and sanitarian, born in Philadelphia, and educated at the University of Pennsylvania and the Hygienic Institute in Berlin, the Pasteur Institute in Paris, and the Pathological Institute in Vienna. Returning, he entered the United States Public Health and Marine Hospital Service, from which he resigned in 1909 to take the chair of preventive medicine and hygiene at Harvard University. In 1911 he became director of the School of Public Health of Harvard University and the Massachusetts Institute of Technology and in 1914 was made director of the antitoxin and vaccine Laboratories of the Massachusetts State Board of Health. His principal writings comprise *Disinfection and Disinfectants* (1902) and *Preventive Medicine and Hygiene* (1913).

ROSENOW, EDWARD CARL (1875–). An American pathologist and bacteriologist, born at Alma, Wis., and educated at Rush Medical College. He became a member of the teaching body in the department of internal medicine at Rush and was made an assistant professor of medicine as well as a member of the research staff of the Institute of Infectious Diseases. These positions he left in 1914 to fill the chair of experimental bacteriology in the Mayo Foundation at Rochester, Minn. In Chicago he had played a notable rôle in the study of focal infection and especially of the selective action of bacteria in attacking certain tissues to the exclusion of others. This line of research he also followed with great success at the Mayo clinic and has made it increasingly apparent that infection from slight deposits of pus is responsible for a very large amount of chronic ailments formerly attributed to natural regressive change in the vital organs. The writings of Dr. Rosenow are scattered throughout periodical literature.

ROSE POLYTECHNIC INSTITUTE. A school of engineering, founded in 1874 at Terre Haute, Ind., opened for students in 1883. The student enrollment increased from 192 in 1914 to 253 in 1924, the faculty from 14 to 16 members, and the productive funds from $800,000 to $1,100,000. In September, 1922, the institute

moved to a site 3 miles outside the city with new buildings and greatly improved equipment in shops and laboratories President, Frank C. Wagner.

ROSS, EDWARD ALSWORTH (1866–). An American sociologist (see VOL. XX). During the decade he continued as professor of sociology at the University of Wisconsin. His later books include *The Old World in the New* (1914); *South of Panama* (1915); *Russia in Upheaval* (1918); *What is America?* (1919); *The Principles of Sociology* (1920); and *The Russian Bolshevik Revolution* (1921).

ROSS, SIR RONALD (1857–). A British physician (see VOL. XX). In 1918 Dr. Ross was knighted. His experience with malaria during the War in Europe and on the eastern front is summed up in a work which he edited, *Observations on Malaria by Medical Officers with the Army* (1919). His *Memoirs of Sir Ronald Ross* (1923) gives the entire summary of his experiences in fighting malaria.

ROSS DEPENDENCY. Following its policy of extending the power and extent of the Empire, Great Britain added an Antarctic domain, the Ross Dependency. An Order of the King in Council, of July 30, 1923, constituted the Ross Sea sector of Antarctica, as a British dependency, under the jurisdiction of the governor-general of the Dominion of New Zealand. The order states that "That part of His Majesty's Dominions in the Antarctic Seas, which comprises all the islands and territories between the 160th degree of East Longitude and the 150th degree of West Longitude which are situated south of the 60th degree of South Latitude shall be named the Ross Dependency." It further appoints the governor-general of New Zealand to be the governor of the Ross Dependency, with power to make rules and regulations, and grants and dispositions of any lands which may lawfully be granted or disposed of by His Majesty. With the Falkland Islands Dependency, Great Britain in 1924 possessed practically one-third of the Antarctic regions to the south of the 60th degree of south latitude It is to be noted that the greater part of South Victoria Land, which was the first made known through the discoveries of Wilkes and later by D'Urville, are not included in Ross Dependency. Presumably the new possession was created with a view to its utility as a breeding and hunting region of marine animals.

ROSTAND, EDMOND (1869–1920). A French dramatist and poet, born at Marseilles (see VOL. XX). During the War he devoted himself chiefly to the writing of patriotic verse. Among his volumes of verse are *Musardises* and *Le Vol de la Marseillaise.* His masterpiece in drama, *Cyrano de Bergerac,* was played with immense success in New York during 1923–24 by Walter Hampden.

ROSYTH. The chief British naval base on the North Sea. It is situated on the Firth of Forth near the city of Dunfermline, where the great bridge crosses the Firth, and is about 10 miles above Leith, the port of Edinburgh. It was begun in 1903 and was ready for use in 1914, but the development of the submarine made the outer anchorage too insecure against torpedo attack. In consequence of this, the main operating base of the Grand Fleet was transferred to Scapa Flow (q.v.), leaving Rosyth as a secondary and repairing base. On account of its greater proximity to their ordinary area of operations it was much used by the battle cruisers. The dockyards, dry docks, wet docks, etc., have been constructed on the very largest scale and are ample to take care of the Grand Fleet. The selection of the site was partly due to the fact that the proposed Mid-Scotland Canal would connect the Firth of Forth and the Clyde with all the latter's great shipbuilding works. See WAR IN EUROPE, *Naval Operations.*

ROTHERMERE, HAROLD SIDNEY HARMSWORTH, first VISCOUNT, (1868–). An English newspaper proprietor, brother of Viscount Northcliffe He was associated with the latter in his newspaper enterprises and in 1916–17 was director general of the Royal Army Cothing Department. He was Air Minister in 1917–18. He endowed a chair of English literature at Cambridge University. Following the death of his brother, he succeeded to the management of the great newspaper properties

ROVE TUNNEL. See TUNNELS.

ROWE, LEO S(TANTON) (1871–). An American economist (see VOL. XX). He was general secretary of the International High Commission (1915–17) and delegate to several Central and South American conferences. He was Assistant Secretary of the Treasury (1917–19) and chief of the Latin-American Division of the State Department in Washington (1919–20). In September, 1920, he became director general of the Pan-American Union.

ROWING. See SPORTS

ROYCE, JOSIAH (1855–1916). An American philosopher (see VOL. XX). During the early years of the War he was active in his denunciation of the German cause and delivered a ringing address after the sinking of the *Lusitania* in May, 1915. He was honored on his sixtieth birthday by a testimonial volume of philosophic essays written by his former students Of his works published after 1914, *The Hope of a Great Community* appeared during his lifetime (1915). It dealt with one of his favorite themes, community loyalty. *Lectures on Modern Idealism* was published posthumously (1919) under the editorship of Professor Lowenberg.

RUBBER. With the universal use of the motor vehicle with its pneumatic or solid rubber tires, the rubber industry has developed into one of the important manufacturing activities of the United States, which by 1922, so far as its product was concerned, exceeded the rubber manufacturing industries of all other countries in the world combined, and consumed nearly 75 per cent of the world's crude rubber production in that year. With 80 per cent of the world's motor vehicles in the United States, it was inevitable that the United States should occupy a leading position in rubber manufacturing, and when to this is added the production of rubber footwear as well as rubber hose and packing, it can be appreciated how important the American industry really is. Germany, England and France were said to exceed the United States in the manufacture of bicycle tires, and while England produces more waterproof fabric she comes second to the United States in the production of rubber hose and packing.

The world's production and consumption between 1910 and 1920 had increased roughly from 70,500 tons to about 350,000 tons in 1920. There was overproduction in that year, so that in 1921 there was a decline in the output and the lowest prices since 1913 were recorded. Low

prices due to overproduction continued notwithstanding the increased consumption in the United States, and it was realized that many of the plantations were either operating at a loss or their future was seriously threatened.

In view of this situation an important event in the world rubber industry was the coming into effect of a plan devised by Sir James Stevenson and a committee known by the name of its chairman as the Stevenson plan. This was accepted by the British government and was put into effect Nov. 1, 1922. This plan involved a restriction of production in the Far East with the object of increasing or at least stabilizing the price of crude rubber from the plantations. In 1923, British- and Dutch-owned plantations produced approximately 93½ per cent of the world's rubber, and of this somewhat more than 33 per cent was controlled by companies owned or managed in the Netherlands. Therefore for the complete success of any restriction scheme the coöperation of Dutch interests and plantations was essential. The original plan developed in 1922 by the British Colonial Office and rubber producers, provided that 60 per cent of the estimated normal crop of rubber would be exported at the minimum duty, while exports in excess of that amount would be taxed heavily, the greater the excess the heavier the tax. The normal output of each plantation was computed and each producer was allotted a certain amount over which he would be taxed. There was no restriction on production, and the producer could hoard his supply if he so desired The growers in the Dutch East Indies were urged to coöperate and to work on the same basis as the British-owned plantations of Malaya and Ceylon, but they almost unanimously declined. The first effect of the plan was an improvement in prices in which naturally the Dutch shared, and the members of the Rubber Growers' Association, the British controlling agency, believed that the plan would be effective without the cooperation of the Dutch East Indies. Naturally there were disturbances in the rubber industry of both Europe and America but these were calmed as prices soon declined. Those behind the scheme were doomed to disappointment as American buyers cut down their purchases, and prices fell below a point where it was believed they could be held by the Stevenson scheme. In the meantime the Dutch East Indies benefited, as their production and exports increased, while those of Malaya and Ceylon were cut down in accordance with the restriction plan. Thus the British Malayan exports in 1923 were about 184,000 tons as compared with 212,695 tons in 1922 and those from Ceylon about 39,000 tons as compared with 46,694 tons in 1922, but the Dutch shipped about 30,000 tons more in 1923 than in 1922, so that the Far Eastern supply was cut only about 9000 tons. Obviously such a small reduction had but little effect on prices, which fell during the year, and was not satisfactory to the advocates of restriction, who, still confident of its efficacy, continued to urge that the Dutch should join with them notwithstanding that they had made some $70,000,000 more on rubber in the year ended Oct. 31, 1923, than in the year before. The British advocates tried to persuade the Dutch not to export more than 100,000 tons in 1924 and they argued that such a restriction would be good not only for the industry but would improve the plantations by preventing the trees from deteriorating under overtapping. The Dutch claimed that they had not overtapped their trees, and that the great increase in rubber output of the Dutch colonies was accounted for not so much by larger production from the estate plantations, possibly some 5000 tons over 1922, but by an extraordinary production of wild or native rubber, which was estimated at over 22,000 tons more than in 1922. The Dutch planters also claimed that the complete cessation of tapping for some such period as three months would be more advantageous than a policy of restricting.

The United States rubber industry began to develop in a remarkable fashion about 1910 and its progress since that time has coincided with that of the motor vehicle for which it is called upon to supply tires. The United States Census of Manufactures for 1914 reported for the American rubber industry 342 establishments giving employment to an average number of 74,022 wage earners and with a production valued at $300,993,796 Of this production rubber belting accounted for $7,989,405, hose for $16,853,693, rubber boots for $12,647,934, rubber shoes for $37,858,222, and tires for $146,421,569. At that time the export business was not important, amounting to about 4 per cent of the total production, England, Germany and France occupying the export markets of the world. From 1913 to 1915, American exports of rubber manufacturers averaged about $12,500,000 annually, but with the War there was a growing demand from Europe and elsewhere for American rubber goods, so that the exports in 1919 amounted to over $53,000,000. In 1920, the rubber industry, in common with other business in the United States, experienced a decline and rubber goods were shipped abroad at an average of almost $7,000,000 monthly. This average inevitably fell, and in 1921 the monthly exports averaged about $2,500,000, though by this time Continental manufacturers were getting reestablished and France in 1921 regained her lead in the world markets for the sale of tires which the United States had taken in 1920 with 38 per cent of the total, a proportion that declined in 1921 to 25 per cent, while France increased her percentage from 27 to 40.

The further progress of the rubber manufacturing industry was indicated by the United States Census of Manufactures for 1921 and for the main divisions may be summarized as follows·

RUBBER MANUFACTURES

	No of establishments	Wage earners (Average numbers)	Value of product
Belting and hose ..	18	3,007	$ 14,880,277
Boots and shoes .	24	23,888	94,032,524
Tires and inner tubes	178	55,496	496,123,335
Rubber goods not elsewhere specified .	276	20,882	99,866,997

In 1923, the total exports of rubber from the United States were valued at $36,972,170, motor vehicle tires forming the largest item, followed by rubber boots and shoes including canvas shoes with rubber soles. The pneumatic casings for automobiles exported in 1923 totaled 1,362,745 valued at $15,293,143, the United Kingdom being the largest customer. In 1923, 96,849 solid tires valued at $2,376,280 were exported. The United States ranked second to France in the world's export trade in tires amounting to about $80,000,000. Of this amount France enjoyed

some 40 per cent, the United States 25 per cent, and Great Britain 12 per cent.

The American tire industry, which is said to account for 80 per cent of the rubber used in the United States had a year of active production, manufacturing 45,000,000 tires in 1923 representing total sales of over half a billion dollars. In 1923 there was successfully introduced the new balloon or low pressure tire (see MOTOR VEHICLES) which met with considerable favor. The cord tire, the use of which had become general, also had been improved and perfected. Likewise better and larger solid tires of rubber for motor trucks were made.

RUBIES, ARTIFICIAL. See MINERALOGY.

RUBLEE, GEORGE (1868–). An American lawyer, born at Madison, Wis., and educated at Harvard University and its law school. In 1897–98 he practiced law in Chicago, removing in the latter year to New York City. He was a member of the Federal Trade Commission (1915–16) and was appointed by President Wilson to report on the Adamson Eight-hour Law in the latter year. During the War he served as a member of the Economic Board of the Council of National Defense and as special counsel of the Treasury Department. In 1918–19 he was American delegate to the Allied Maritime Council in London.

RUDDER, FLETTNER. See NAVIGATION.

RUFFO, TITTA (1878–). An Italian dramatic baritone, born at Pisa. He studied under Persichini at the Accademia Santa Cecilia in Rome and then under Cassini in Milan. In 1898 he made his début at the Teatro Costanzi in Rome as the Herald in *Lohengrin*. It was not until the following year, in Rio de Janeiro that he had the opportunity of appearing in principal parts; his unusual gifts both as a singer and actor were quickly recognized. After his return he sang at the principal Italian opera houses and also won triumphs in Paris and Vienna. His American début as Rigoletto with the Chicago Opera Association (Nov. 4, 1912) caused a veritable sensation. He later revisited the United States several times, and always appeared with the same success, both in opera and in concert.

RUHR OCCUPATION. See REPARATIONS.

RULE OF REASON. See LAW, PROGRESS OF THE.

RUMANIA. An eastern European country, with an area of 122,282 square miles, as compared with 53,489 square miles before the War. The cession of the following provinces accounted for the increase: Bessarabia (17,146 square miles), Bukovina (4030), Transylvania (22,312), Crisana (8038), Maramuresh (6258), Bânât (11,009). The population in 1914 numbered 7,768,341; in 1920 it was 16,262,177. Of the latter, 3,348,860 lived in urban communities and 12,913,317 in rural. Cities of over 50,000 in order were: Bucharest, the capital (308,987 inhabitants in 1917), Chisinau, Czernawitz, Ismail, Jassy, Galatz, Temesvâr, Braila.

Education; Religion; Race. Elementary education, though free and compulsory, was still in a rudimentary state. In 1918–19, 5764 elementary schools with 692,986 pupils, 76 secondary schools for boys with 44,983 pupils, and 66 secondary schools for girls with 9584 pupils were reported. Besides the universities at Bucharest and Jassy, two additional were opened, at Cluj in Transylvania in 1919 (1980 students in 1920) and at Czernawitz in Bukovina in 1920. In 1918, 9,695,714 communicants belonged to the National Orthodox Church, 1,456,147 to the Greek Catholic, 1,483,929 to the Roman Catholic. Besides, there were 1,344,970 Protestants, 834,344 Jews, and 44,098 Mohammedans. Though figures were not available, a consideration of ethnographic surveys indicated that Rumania's problem of racial groups was one of great importance. There were large numbers of Magyars in Central Moldavia and East Transylvania, Saxons and Swabians in South Transylvania and the Bânât, Germans and Ruthenians in Bukovina and Bessarabia, Bulgarians and Serbs along the Danube, Bulgars, Russians, Germans, Turks, and Tatars in the Dobrudja, and Russians in Bessarabia. By the Minorities Treaty signed with the Allies in 1919, Rumania pledged herself to respect all racial, linguistic, and religious differences and to permit the establishment of churches, schools, and eleemosynary institutions. These pledges were repeated in the new constitution of 1923.

Industry. Agriculture, as in Old Rumania, was the main resource of the population of Greater Rumania. The total acreage planted to the principal cereals in 1922 was about seven-eighths as great as that in the same territories before the War; the yield was much lower. For Old Rumania alone, the average acreage under wheat, corn, barley, oats, and rye for 1911–15 was 12,586,000; in 1922, it was only 10,736,000. For Greater Rumania, the average acreage of cereal crops in pre-war years was 24,879,000; in 1922, 22,395,000; in 1923, 23,767,000. The greatest change was in the shift from the cultivation of wheat to that of barley and oats. Besides the cereals, there were 11,250 acres under tobacco in 1920 and 704,000 acres of vineyards and orchards. The depredations of the War accounted for great fallings-off in live stock. There were in Greater Rumania, in 1922, 1,802,051 horses (824,714 in Old Rumania in 1911), 5,932,210 cattle (2,666,000 in 1911), 12,872,281 sheep and goats (5,456,000 in 1911), 3,146,806 swine (1,021,465 in 1911). The export of grain, hitherto so important, was only 1,267,000 tons for Greater Rumania in 1922, as compared with 2,965,000 tons for Old Rumania in 1913. The most important mining activity was that of petroleum. In 1913, 1,885,000 metric tons were extracted; in 1922, only 1,364,000 tons. Refining was done in the country and most of the product was exported. In 1922 there were 426 wells and 1375 miles of pipe lines. Principal wells were located at Prahova, Dambovitza, Bacau, and Buzau. The wells and refineries were destroyed in 1916 to prevent their falling into the enemy's hands, but during the German occupation extensive restorations took place. Natural gas production, a new development, reached 1,500,000,000 cubic meters in 1922. Coal, salt, and other minerals were produced in small quantities. Aside from petroleum refining, grain milling, and lumbering, manufactures were little developed. Plants were devoted to textiles, leather, iron and ceramic products. In 1919, 2747 establishments employed 157,423 workers, as compared with 1149 establishments and 58,871 workers in 1915.

Trade and Communications. Trade after the War continued to languish. In 1914, imports into Old Rumania totaled $97,319,000; in 1920, imports were $138,463,000 (at exchange

rate for the year). The export trade showed the real state of affairs. In 1913 exports were valued at $129,446,000; in 1921, at $100,807,000; in 1922, at $84,763,000 (the latter two figures at exchange rates for the year) The decline was particularly prominent in the cereal and petroleum products. The only articles to gain conspicuously over the period were barley, oats, and lumber Exports to the United States, in 1913, were $146,000; 1922, $500,000, 1923, $336,440. Imports from the United States, 1913, $3,237,000; 1922, $2,436,000; 1923, $1,177,758. Nothing more graphically indicates the decline than the figures for the carrying trade. In 1912, 36,968 vessels of 10,807,213 tons entered the country's ports, in 1919, 10,546 vessels of 2,991,095 tons entered. The merchant marine in 1912 consisted of 649 vessels of 198,159 tons; in 1919 it was 158 vessels of 71,158 tons. The country's principal seaports were Constanza, Galatz, Braila In 1920 the total railway mileage was 7246, of which 60 per cent was state-owned. By the Treaty of Versailles the Danube Commission was reconstructed to consist only of representatives of Great Britain, France, Italy, and Rumania

Finance and Economic Conditions. For 1913–14 the budget balanced at 600,232,900 lei ($115,844,950); the budget for 1922–23 provided for expenditures of 10,498,000,000 lei ($85,000,000 at the rate of exchange then prevailing). Chief sources of revenue for 1922–23 were enumerated as direct taxes, 650,000,000 lei; indirect taxes and customs, 3,310,000,000; stamp taxes, 571,000,000; state monopolies, 1,626,000,000 The public debt on Oct. 1, 1913, amounted to $341,455,000; in 1922 the total foreign debt, exclusive of the share in the obligations of the Austro-Hungarian monarchy, amounted to $1,025,000,000 at par of exchange. Included in the latter were debts to the Allies and the United States aggregating $396,000,000. The internal debt consisted of obligations given to the National Bank against paper money issues. In 1923, 15,390,824,000 lei in paper currency were in circulation, as compared with 578,000,000 in 1914. The budget for 1924 was the first since the War to contain a service for the internal and external funded debts. The failure to fund a large part of the debt, and the inability of merchants to meet their foreign obligations incurred after the War and the continued currency depreciation contributed to the commercial stagnation In 1923 a temporary moratorium was declared. The exchange value of the leu for typical years was: 1914, $0.193 (par); 1920, $0.02; 1921, $0 012; May 1, 1923, $0 005. The cost of living index was· 100, Aug. 1, 1916; January, 1922, 1858, January, 1923, 2494; December, 1923, 3552. The wage index, based on 100 for 1914, was 1548 in 1922.

History. From the opening of the War to Aug. 28, 1916, Rumanian politicians watched the straws to detect the direction of the wind. Although bound to the Central Powers by a secret alliance based on traditional dread of Russian aggrandizement, Rumania refused to join her confederates when the War broke out, and during the early years of the struggle conversations were continually being carried on with Allied representatives in an attempt to strike a favorable bargain. Rumania sought expansion in all directions: to the north where the Bukovina (Austrian) lay, to the northeast for Bessarabia (Russian), to the west for Transylvania and the Bânât (Hungarian). The Teutonic successes against Russia in 1915 and the subsequent conquest of Serbia cooled the Rumanian ardor for a time, but the successful Russian offensive of the summer of 1916 against Austria, giving rise to a fear lest Russia conquer for herself Bukovina and Transylvania, together with Allied victories on the Somme and at Gorizia, and the preparations at Saloniki, strengthened the hand of the interventionists. In the summer of 1916 Rumania secretly obtained from the Allies a promise of the Bukovina (in part), Transylvania and border regions to the west, and all the Bânât (qq.v.), as the price of Rumanian intervention; the Allies further agreed to support Rumania by pressing military offensives in Galicia and Macedonia. On Aug 28, 1916, therefore, Rumania confidently declared war on Austria, and Rumanian troops enthusiastically marched through the defiles of the Transylvanian Alps to liberate their kinsmen from Hungary Then, swiftly, disaster overtook the Rumanian cause. From the south, a Bulgarian army swept into the Dobrudja to stay until the end of the War, while from the north General Falkenhayn pursued the shattered Rumanian army back across the frontier, across the Wallachian plain, and into Moldavia On Nov. 27, 1916, Bucharest, the capital, was abandoned by the King and Parliament, and Jassy was made the seat of government Wallachia was overrun, the large stores of grain captured and transported to Germany, and the oil fields operated by the invader for his own purposes. A counteroffensive was prepared for 1917, but the gradual disintegration of the Russian army deprived the Rumanians of effective Russian aid, and the defeat of Marasesti completely crushed Rumania. Some months later Rumania was compelled to accept an armistice dictated by Germany. Meanwhile internal unrest hastened a group of long-agitated reforms. Under the shadow of a complete German occupation, the parliament passed a radical agrarian law, fixing the maximum holding at 50 hectares and providing for distribution of some 2,000,000 hectares among the peasantry.

Hope based on further popular resistance was illusory, for the Rumanians were compelled to accede to a humiliating peace in March, 1918 (Treaty of Bucharest), by which they were deprived of the Dobrudja and control over the Danube, as well as the possession of their railways, wheat crops, and petroleum wells, for an indefinite period It was inevitable that the Rumanians should suffer all the tribulations of a conquered people, e g. forced labor, requisitions of foodstuffs and supplies, a constantly depreciating foreign currency, etc. The Marghiloman government, i e. the Rumanian ministry during the occupation, in its endeavor to satisfy all factions, naturally could please none. With the fall, therefore, of the Central Powers and the triumphal reëntry of the King into Bucharest on Dec. 3, 1918, the militant nationalists, flushed by a victory in which they considered themselves participants, assumed control of the government without waiting for a parliamentary mandate and took a threatening posture toward their late enemies. The annexation of Bessarabia (q.v.) was declared a *fait accompli*, an army was sent into Transylvania to support the movement for independence and union with Greater Rumania. In 1919, when food scarcity, industrial unrest, and political propaganda all threat-

ened an internal upheaval, the government attempted a diversion by sending an army into Soviet Hungary. It was feared of course that radical ideas might infect the Rumanians and that Soviet Hungary might also become aggressive. At the same time it no doubt occurred to leading Rumanians that a show of force must impress the Peace Conference, then sitting at Paris By August 3, Rumanian troops were encamped in the suburbs of Budapest. In spite of the protests and even threats of the Allies, the Rumanians entered Budapest and proceeded to confiscate foodstuffs, farm animals, tools, and rolling-stock. Not until Admiral Horthy was safely installed in Hungary as regent did the Rumanians consent to quit the country. By the peace treaties of St. Germain (Austria) and the Trianon (Hungary), the Bucharest "peace" (above) was canceled and Rumania was given sovereignty over most of Bukovina, all Transylvania, together with a strip of the Hungarian plain west of the Transylvanian uplands, and the northeastern half of the Bánát of Temesvár. The Treaty of Neuilly (Bulgaria) confirmed Rumania in possession of the Dobrudja Moreover, by a treaty signed with the Allies in October, 1920, Rumania was authorized to retain Bessarabia. A minority treaty (Dec 9, 1919) dictated by the Allies guaranteed liberal treatment of minorities in the annexed as well as in the pre-war territories of Rumania. The combined result of the peace treaties was to more than double Rumania's area and population, despite the distinctly inglorious rôle which the nation had played in the War.

The years following were concerned with the vexing internal problems of constitutional reform, the agrarian question, and the general unrest brought on by tardy reconstruction measures. Ministries fell rapidly. In 1919–20 an agrarian minorities bloc tried to form a government, but it soon gave way to the ministry of General Averescu, supported by Take Jonescu, which was strongly nationalistic in temper. The minorities in Bukovina, Transylvania, and Bessarabia, were antagonized by the dissolution of their national councils; the failure to hasten the land reform measures aroused the hostility of the peasants. Meanwhile the prisons were being filled with political prisoners. In 1921, Jonescu headed a ministry, in 1922, Jon Bratiano succeeded him. On Oct. 15, 1922, the coronation of King Ferdinand and Queen Marie as rulers of Greater Rumania was celebrated. The year marked a heightening participation of Rumania in foreign affairs. The Rumanian government renewed its adhesion to the Little Entente (q.v.), which it had formed together with Czecho-Slovakia and Jugo-Slavia in 1920, and by its firmness it forced the Russians temporarily to accede to the annexation of Bessarabia. The goings and comings of Queen Marie over Europe, and her success in marrying her daughters to the Kings of Greece and of Jugo-Slavia, gave Rumania a certain conspicuousness perhaps hardly justified by its internal condition or its potential development. The year 1923 saw no further advance toward stability. Antisemitism, that barometer of the morale of a people, was rife and led to frequent attacks on the Jews and on the government for being presumably sympathetic toward Jewish aspirations. Fascism, inspired by Italian success, seized the country with the result that 100,000 Black Shirts were soon enrolled. Even the promulgation of the National Constitution (Mar. 28, 1923), which in some senses was an advanced document, did not serve to quiet the unrest. By it, minority representation was provided and full rights of citizenship were granted to Rumanian Jews; the State claimed for itself all mineral wealth, including oil, to be found in the subsoil, as well as water-power properties, etc.; constitutional guarantees were set up for the freedom of the press and against the imposition of a censorship, for the freedom of association, public assembly, etc. The failure to satisfy the peasants by a land division, the repeal of the more liberal declarations of Bessarabia and Transylvania of 1918 which established land and electoral reforms, and the recognition of the Greek Orthodox Church as the dominant ecclesiastical body to the neglect of the Roman Catholic Magyars, resulted in the strengthening of an opposition whose character presaged future difficulties.

The year 1924 hardly saw an alleviation of Rumania's difficult position Threatened by Russia on one side, rebuffed by the Great Powers consistently, with the possibility of internal dissension hanging over the country like a black cloud, the government's deportment plainly showed its uneasy frame of mind. Russia abruptly terminated the Russo-Rumanian conference at Vienna in March because of the Bessarabian question. There was continual talk of Russian desire to establish a Moldavian republic centring in Bessarabia and including Kherson and Podolia. Whether Russia meant to attack or not, the Rumanian official attitude certainly favored preparedness, for a steady stream of munitions was proceeding from France into the country. In April and May the Rumanian royal family completed a round of visits to Paris, Brussels, and London. Rome and Madrid were, significantly enough, dropped from the itinerary at the request of Mussolini and Rivera. But the financial and diplomatic purposes behind the visits ended in flat failure: Rumania received neither promises of military aid nor the proffer of funds to relieve her economic distress. Foreign governments were further antagonized by the mining law of July, 1924, which ordered all foreign-owned corporations to sell 60 per cent of their shares in Rumania, at, of course, Rumanian prices. This was in reality interpreted as a move on the foreign oil companies, whose properties were valued at $150,000,000. To further complicate the domestic situation, protests were frequent against the virtual dictatorship of the Bratiano brothers, while the communists continued active In short, from the economic and political points of view, Rumania's situation, in spite of the country's lofty pretensions, was as critical as that of her neighbors, Bulgaria, Greece, and Hungary, whom she affected to despise. See also TRANSYLVANIA; WAR, DIPLOMACY OF THE.

RUMANIAN LITERATURE. War invaded the heart of Rumania; the flames of revolution were spreading at her very gates. The decade in Rumanian literature exhibits the scars of the tragedy. Moreover, the toll of death among the coryphei was exceedingly heavy during this period.

Prof. Paul Bujor relates the exodus of Alexandru Vlahută (1859–1920) from Wallachia, in the winter of 1916 under the fire of the enemy, in an ox cart in the midst of the unfortunate people who were fleeing from the invaders.

When kings have shared the same fate, what matter if a dreamer remained among his brethren in want and despair? Barbu Delavrancea (1858–1918), the author of *Trubadurul* and *Paraziții*, and George Cosbuc (1856–1918), the bard of the peasantry, died in this period of stress. Titu Maiorescu (1840–1917) and C. Dobrogeanu-Gherea (1855–1920), the fathers of Rumanian criticism, left almost bare this field of letters, closing with their eyelids the epoch of Mihail Eminescu (1850–1889), the greatest Rumanian poet, under whose influence the language and inspiration of the Rumanians reached the highest peaks. Of this generation survives only Ioan Slavici (born in 1848), novelist, as I. L. Caragiale (1852–1912) and Ronetti Roman (1852–1908), the pillars of the Rumanian theatre, Alexandru Macedonschi (1853–1921) and Duiliu Zamfirescu (1858–1922), the two subtle poets, have also passed on. And here we must add the early death of the most original poet after Eminescu, Dimitrie Anghel (1873–1914), delicate, penetrating, endowed with a rare colorful fantasy, lover of flowers and their magic troubadour; and the untimely deaths of P. Cerna (1877–1913), the profound; St O Iosif (1875–1913), the patriarchal; A. Steuerman-Rodion, the revolted one; B. Nemțeanu (1888–1919), intimate and sincere; Haralamb Lecca, the select; Emil Gârleanu (1878–1914), short story writer; Ilarie Chendi (1874–1913), the caustic critic. Finally, the young and promising Mihail Săulescu, poet of the undefined, I Chiru-Nanov, prose writer, and Ion Trivale, critic, who paid the tribute of Mars with their lives.

Yet from the ruins and ashes of old Rumania a new and greater Rumania arose, and, as her people were gaining more and more liberties, life and work were blooming again.

In poetry the new generation boldly rivaled its elders. Octavian Goga, born in 1881, who once sang of the downtrodden; Ion Minulescu, builder of sonorities and symbols; Ovid Densusianu, scholar and thinker, discreet and deep; Tudor Arghezi, new and daring; N. Davidescu, aristocratic but warm, Enric Furtună, to whom only Cerna can be compared; Mihail Codreanu, the suave; A. T. Stamatiad; Artur Stavri; Barbu Lăzăreanu; Adrian Verea; Leon Feraru, born in 1887, Donar Munteanu; Vasile Militaru; George Gregorian; G. Topârceanu; Corneliu Moldovanu; Eugeniu Speranța; Radu D. Rosetti, still young; Pan Halippa; A. Toma; A. Axelrad; Elena Farago; Natalia Negru; Alice Calugăru; Maria Cuntan; G. Murnu; G. V. Bacovia, the strange and secluded; O. Carp; Ion Buzdugan. The new generation has given Ion Pillat, many-hued, poet of the old manner and editor of *Antologia Toamnei;* Emil Isac, warm, dashing; Lucian Blaga; I. M. Rașcu; Dragoș Protopopescu; Eugen Relgis, passionate lover of freedom; Virgiliu Moscovici, Biblical; A. Dominic; Adrian Maniu; A. Philippide; Demostene Botez; M. Cruceanu; Em Cerbu; Emanoil Bucuță; Perspessicius; Mia Frollo; Ieronim Laurian; Ion Barbu; Camil Petrescu; Nichifor Crainic; Horia Fortună; Camil Baltazar; Claudia Millian; Alfred Moșoiu; George Vocvidca. The sway of Anghel left a deep imprint in the poetry of the later years. What characterizes it is the graceful blending of the native popular and the European.

In the short story and novel the leader was Mihail Sadoveanu (born in 1880), in whose work Moldavia, his native province, appears in all her glory. Gala Galaction is the most artistic and sophisticated. V. Demetrius and Liviu Rebreanu succeeded in the novel. Others are: Ion Agârbiceanu (born in 1882), Jean Bart-Botez, Ion Gorun, Sandu-Aldea, D D. Pătrășcanu, I. Bassarabescu, I. Brătescu-Voinesti, Victor Crăsescu, A. Cazaban, Vasile Pop, Ion Dragoslav, Hortensia Papadat-Bengescu, M. Beza, the Macedonian story teller, N. Batzaria, N. Ciotori; as well as the young Cezar Petrescu, Ionel Teodoreanu, F. Aderca, Ion Pas, Sarina Cassvan-Pas.

To the theatre contributed: A. Davila, Victor Eftimiu, whose plays are being produced in several European theatres, A. de Herz, Mihail Sorbul, Cathon Theodorian, Cora Irineu (died in 1924), B. Luca and Dr. A. Stern, the translator of Shakespeare.

In criticism Ovid Densusianu, the poet, also the editor of *Viața Nouă*, continued consistent in his principles laid down 20 years earlier. There were also: N. Iorga, the learned historian, M. Dragomirescu, Eugen Lovinescu, G. Ibrăileanu, H. Sanielevici, A. Spiru-Bacău.

Political writers of fine calibre were Dr. N. Lupu, the statesman and leader of the peasant party, Constantin Graur, Constantin Stere, Eugen Filotti, Dem. Theodorescu, S. Labin, Emil D. Fagure, B. Brănișteanu, Iosif Nădejde, Delafras, P. Mușoiu, N. D. Cocea, Tudor Theodorescu-Braniște, M. Sărățeanu, M. Schwarzfeld, M. Schweig, I. Rosenthal, H. St Streitmæn, author of *Revizuiri*

Profs. C. Rădulescu-Mortu, S. Mehedinți, I. Petrovici, Vasile Pârvan, G Vâlsan, A. Candrea, Gh. Adamescu, G. Bogdan-Duica, etc., were aiming, like almost all the writers mentioned here, at bringing Rumanian culture nearer to the western standards. Europism is the new word they coined, and its tendency was toward the overthrowing of old barriers.

RUMBOLD, Sir Horace George Montagu (1869–). A British diplomat. In 1890 he became British Attaché at The Hague. After passing a competitive examination he was appointed to Cairo in 1891, and after serving at many other places, Vienna, Madrid, Tokio, etc., he was Chargé d' Affaires at Berlin, July 1–27, 1914. On the declaration of war he left Berlin and was employed in the Foreign Office in London. He was British Minister to Switzerland from 1916 to 1919 and to the Republic of Poland in 1919–20. He was British High Commissioner at Constantinople and as deputy for Lord Curzon was head of the British delegation at the Lausanne Conference in November, 1922.

RUPPRECHT, Crown Prince of Bavaria (1869–). (See Vol. XX). He commanded the Bavarian troops which won the battles in Lorraine in August, 1914. He commanded the German front at Artois and southern Flanders, was made field marshal and given the chief command of the northern group of armies on the western front. He renounced his claim to the Bavarian throne at the time of his father's abdication in 1918, and was said to have privately stated his disapproval of the German foreign and military policy in the War.

RURAL CREDIT. See Agricultural Credit.

RUSBY, Henry Hurd (1855–). An American botanist and physician (see Vol. XX). In 1917 Professor Rusby led an exploring party to the mountains of Colombia, in a search for sources of quinine. In 1921–22 he made a sec-

ond trip, partly in the interest of identification of the so-called "courage plant."

RUSSELL, BERTRAND (ARTHUR WILLIAM) (1872–). A British philosopher (see VOL XX). During the War he was a propagandist for pacifism and was imprisoned for six months for attacking the reputation of the American army. He was also forced out from his chair at Cambridge University. He thus identified himself more and more with radical movements, and when a delegation from the British Labor party sailed to investigate conditions in Soviet Russia, he accompanied them. He came away disillusioned with communism and wrote up his dissatisfaction in *The Practice and Theory of Bolshevism* (1920). Sailing for China in 1920, Russell found amid the ruins of the Celestial Empire a greater promise of freedom than that of the Occident. In China he composed a work on *The Analysis of Mind* (1922), in which he accepted the principal tenets of behavioristic psychology. In 1924 he visited the United States as a professional lecturer. Half flatteringly, half in the manner of Cassandra, the eminent philosopher predicted the gradual enslavement of impoverished Europe to the mechanical civilization of America. In addition to the works mentioned, Russell published after 1914: *Principles of Social Reconstruction* (1917); *Mysticism and Logic* (1918); *Roads to Freedom* (1918); *Introduction to Mathematical Philosophy* (1919); *The Problem of China* (1922); *The A B C of Atoms* (1923); *Icarus* (1924).

RUSSELL, HENRY NORRIS (1877–). An American astronomer, born at Oyster Bay, N. Y., and educated at Princeton University. He was a Carnegie research assistant at the Cambridge Observatory in England in 1903–05. In 1905 he became an assistant in astronomy at Princeton: in 1911, professor; and in 1912, director of the Observatory there. The stars were the subject of his researches. He published papers on stellar parallax, stellar evolution, and stellar statistics, as well as on binary stars and eclipsing variables. He was an engineer in the Air Service of the United States Army in 1918 as well as a member of the National Research Council. Professor Russell became a Fellow of the Royal Astronomical Society, whose gold medal he won in 1921. In the same year he became a research associate of Mt. Wilson Observatory.

RUSSELL, JOHN (1885–). An American journalist and author, born at Davenport, Iowa, and educated at Northwestern University (1903–05). For several years he traveled widely in various parts of the world. He was special correspondent and staff writer for several papers and magazines and contributed many articles and short stories to periodicals. During the War he was in charge of the United States government propaganda in Great Britain and Ireland. He wrote *The Society Wolf* (1910); *The Red Mark* (1919); *Where the Pavement Ends* (1921), and *In Dark Places* (1924).

RUSSELL, WILLIAM FLETCHER (1890–). An American educator, born at Delhi, N. Y., and educated at Cornell University. After teaching for several years in Greeley, Colo., he became assistant professor in history and sociology at the State Teachers' College, and after studying at Columbia University and serving as assistant in the philosophy of education there, he was appointed associate professor of secondary education at the George Peabody College for Teachers in Nashville, Tenn. From 1916 to 1917 he was professor of that subject. In 1917 he was dean of the College of Education at the State University of Iowa. Professor Russell wrote *The Early Teaching of History in New York and Massachusetts* (1915); *Economy in Secondary Education* (1916); *Education in the United States* (1917); *Schools in Siberia* (1919), etc.

RUSSELL SAGE FOUNDATION. An organization incorporated in 1907 for the improvement of social and living conditions in the United States. Its work, which gives large place to research and publication, is carried on by a staff of men and women trained in special lines of investigation and social welfare. The direct activities of the Foundation are carried on through the following eight departments: Charity Organization; Child Helping; Industrial Studies; Publications and Library; Recreation; Remedial Loans; Statistics; and Surveys and Exhibits. In the decade 1914–1924, 36 books and more than 125 pamphlets and monographs were published. A number of investigations are now in process, among them, present-day administration of marriage laws in the United States; schools for juvenile delinquents; a series on various important experiments in employees' representation and other developments in industrial relations; public recreation in New York City, summer camps; the small loan business; employment statistics; social publicity methods; and arts and crafts of immigrant peoples. The library of the Foundation has developed steadily and now contains some 23,723 bound volumes and 76,914 pamphlets; its attendance in 1924 numbered 21,819. In 1917, when the United States entered the World War, the services of the staff were offered to the government. Five new Federal bureaus or divisions grew out of wartime activities with which members of the staff of the Foundation were associated in an organizing or administrative capacity: the Division of Statistics, a branch of the General Staff; a Woman in Industry Service, under the Department of Labor; an Education-Recreation Division of the Army and a similar division in the Bureau of Navigation; and a Savings Division in the Treasury. In 1919, the Southern Highland Department of the Foundation was discontinued and in 1920, the Department of Education was given up. In 1923 a new division of child welfare legislation was organized and in 1924 a consultation service in penology and delinquency was opened. The Foundation has continued its work of conference and consultation in the field of its activities. Besides the regular work, a number of grants to social agencies engaged in similar work have been made. In 1922, through a committee appointed by the Foundation, a Regional Plan of New York and Its Environs was inaugurated, to be assisted financially for a five year period and housed by the Foundation in the Foundation building. General director, John M. Glenn; president of the board of trustees, Robert W. de Forest.

RUSSIA. A federal republic comprising the greater part of the former Russian Empire and officially entitled the Union of Socialist Soviet Republics, more familiarly known as Soviet Russia. It stretches over a vast expanse of territory in eastern Europe and northern Asia. Capital, Moscow.

Political Divisions. The Union of Socialist Soviet Republics consists of six Socialist Fed-

erated Soviet Republics, which are further subdivided into autonomous republics and autonomous provinces. The principal federations are: (1) the Russian Socialist Federated Soviet Republic (capital, Moscow), embracing the principal Great Russian "governments" or states of Russia in Europe and Western Siberia; (2) the Ukrainian Socialist Federated Soviet Republic (capital, Kharkov); (3) the White Russian Socialist Soviet Republic (Minsk); (4) the Federation of Transcaucasian Soviet Republics (Tiflis); (5) the Far Eastern Republic (Vladivostok); and (6) the Bokhara People's Soviet Republic (Bokhara). The Republic of Khoresma (Khiva) is affiliated with the Union but not a member of it. The Russian Socialist Federated Soviet Republic is composed of the following autonomous republics and autonomous territories (administrative centres in parentheses): Crimean Republic (Simferopol), Bashkir Republic (Ufa), Tartar Republic (Kazan), Kirghiz Republic (Orenburg), Turkestan Republic (Tashkent), Daghestan Republic (Makhatch-Kala), Mountain Republic (Vladikavkaz), Yakutsk Republic (Yakutsk), Carelian Republic (Petrozavodsk), Buriat-Mongolian Republic (Irkutsk), Chuvash Autonomous Territory (Cheboksary), Kalmyk Autonomous Territory (Astrakhan), Mariisk Autonomous Territory (Krasnokokshaisk), Votyak Autonomous Territory (Izhevsk), Kabardin-Balkar Autonomous Territory (Nalchik), Zyriany Autonomous Territory (Ust-Sysolsk), Karachaef-Cherkass Autonomous Territory (Batalpashtchinsk), Oiratski Autonomous Territory (Oolala), Adigheiski-Circassian Autonomous Territory (Krasnodar), Volga German's Territory (Pokrovsk), Chechen Territory (Grozny).

The Transcaucasian Federation consists of three principal republics, namely, Azerbaijan (principal town, Baku); Armenia (Erivan); and Georgia (Tiflis). Tiflis is the capital of the federation. Besides these, there are also incorporated in the federation the minor republics of Abkhaz (principal town, Sukhum) and Adjar (Batum). By the Treaty of Brest-Litovsk (Mar. 3, 1918) the Ukrainian Republic was detached from Russia and placed under German control but subsequently became reunited with Soviet Russia. (See UKRAINE.) The provinces of Volhynia, Vilna, Kovno, and Grodno were separated from Russia and became part of Poland, while the provinces of Erivan and Kars passed to Turkey. The border provinces of Latvia, Esthonia, and Lithuania (qq.v.) became established as independent states, and so did the Grand Duchy of Finland (q.v.), while the province of Bessarabia (q.v.) was annexed to Rumania.

Area and Population. Russia in Europe, total pre-war area, 1,999,939 square miles, less lost territory, 178,586, leaves a present area of 1,821,353 square miles; Transcaucasia, 95,534, less Kars, 7700, leaves an area of 87,834; Asiatic Russia, 6,207,067; total Soviet Russia, 8,116,254 square miles; pre-war Russian Empire, 8,302,540 square miles. The population of present Soviet Russia is shown in the following table:

	Soviet census Sept. 1, 1920	Official estimates End of 1914
Russia in Europe	102,207,800	120,560,000
Asiatic Russia	23,407,500	21,615,000
Transcaucasia	5,683,700	6,985,000
Total	131,299,000	149,160,000

The figures for 1914 are about 10 per cent higher than those given for that year in the *Soviet Statistical Annual*, which expresses the opinion that pre-war estimates were exaggerated to that extent. No official census was taken by the old Russian government after 1897, but the changes in population were estimated each year by comparing the statistics of births, deaths, and migration. Difficulty in comparing these pre-war estimates with the recent census also arises from boundary readjustments, for it is impossible from available information to distinguish exactly the pre-war (estimated) population of certain Russian districts which have been divided between Soviet Russia and other countries. Assuming, however, that both sets of figures cited in the table above are correct, it would appear that there has been a decrease of some 18,000,000 in the population since the beginning of the War. In view of the fact that prior to the War the population was rapidly increasing (for pre-war Russia as a whole from 128,924,000 in 1897 to 182,183,000 in 1914), this decrease is striking. Of the total population of European Russia in 1920, the Ukraine had 25,605,000. The population of Asiatic Russia was distributed between Siberia, 11,160,300; Kirghizia, 5,045,700; and Turkestan, 7,201,500. Of the total population, 61,046,200 were males and 70,252,800 females. On Mar. 15, 1923, a census of the urban population revealed that the population of Russian cities and towns in general had declined by 1.8 per cent compared with the census of 1920. The total urban population was found to number about 21,700,000, exclusive of army garrisons. A comparison of 1772 cities and towns showed an increase of population from 17,606,000 in 1920 to 18,239,000, or 3.6 per cent. An increase of 858,000 in the population of the two capitals, Moscow and Petrograd, during this period, was somewhat offset by a decrease of 225,000 in all the rest of the townships. Eliminating Moscow and Petrograd, as well as Eastern Siberia, Turkestan, Transcaucasia, and four provinces where no census was held in 1920 (Volhynia, Podolia, White Russia, and the Crimea), the results of the census of Mar. 15, 1923, were as follows:

Regions	Number of towns	Inhabitants, 1920	Inhabitants, 1923	Percentage of shift
Russian Soviet Republic:				
Consuming (industrial)	459	2,665,178	3,061,830	+14.9
Producing (agricultural)	408	4,687,554	4,407,798	− 6.7
Ukraine	318	4,212,452	3,907,572	− 7.6
Southeastern region (Kuban, Stavropol, etc.)	49	1,262,258	1,210,728	− 4.1
Kirghizia (steppes)	21	363,373	371,445	+ 2.2
Western Siberia	55	865,195	837,222	3.2
Total	1,310	14,056,010	13,796,595	− 1.8

The growth of industrial production in certain localities and the famine of 1921 in the

agricultural belt greatly affected the movement of population. In the so-called consuming districts, outside of the agricultural belt, all of the 17 provinces comprising the northwestern section of Soviet Russia showed an increase of urban population. The five great textile districts have shown the highest accretions. Of the 19 provinces comprising the so-called food-producing belt, those four adjacent to the industrial area showed increases of urban population, while the remaining 15 showed decreases ranging from 20.8 per cent in Samara down to .4 per cent in Astrakhan. Of the nine provinces of the Ukraine, the four northern showed increases. In the four southern provinces heavy declines were registered: Volhynia, 11.2 per cent; Donets, 12.1; Ekaterinoslav, 16 5; and Odessa, 23 8 per cent. The estimated decrease in Podolia was .8 per cent. The population of the city of Odessa dropped from 454,187 to 316,740, or 30 3 per cent; Nikolaiev, from 108,777 to 81,366, or 25.2 per cent; Kherson, from 74,703 to 40,796, or 47.5 per cent—the heaviest percentage of decline in Russia. The population of the principal cities of Russia (above 50,000) in 1917, 1920, and 1923 was as follows (the figures of 1897 are not comparable as regards the male population, since the latter included the military garrisons, which were eliminated in the census of subsequent years):

	1917		1920		1923	
	Total	Female	Total	Female	Total	Female

* Renamed Leningrad on the death of Lenine, in January, 1924.

In 1920 the proportion of male population to female in the towns and cities was 455 males to 555 females; in 1923 it was 470 males to 530 females. In all cities and towns the number of men increased by 566,000, or 7 per cent; the number of women by 67,000, or .6 per cent. With the elimination of Moscow and Petrograd, however, the number of men increased by only 93,000, or 1.2 per cent, while the number of women decreased by 318,000, or 3.7 per cent. The above shifts were chiefly the results of the demobilization of the Red Army.

Government. The form of government of the Union of Socialist Soviet Republics (U.S.S.R.) may be described as an oligarchy in the guise of a federated republic. According to the new Soviet constitution drafted in July, 1923, and ratified in February, 1924, sovereign power is vested in the supreme organs of the Federation, i.e. the Union Congress of Soviets, the Central Executive Committee of that Congress, and its Presidium. The Congress of Soviets, of about 2000 members, is elected by the various congresses of the federated republics and meets for a week once a year. The Central Executive Committee is composed of two houses, known respectively as the Federal Council and the Council of Nationalities, the former consisting of 371 members elected by the Federal Congress of Soviets according to population, and the latter of some 98 members, five elected by each federated member state and one by each of the autonomous republics or districts. Each of these two houses elects its own Presidium, or standing committee, of seven members. Between sessions of the Federal Congress of Soviets, the Central Executive Committee is the supreme organ. It meets three times a year and is replaced during recesses by a presidium of 21. The Central Executive Committee jointly elects federal commissars (or ministers) on the following basis: (A) five federal commissariats, all regional representatives of which in the participating states are appointed by and responsible to the Union commissars, viz.: (1) foreign affairs; (2) army and navy; (3) foreign trade; (4) transport; (5) post and telegraphs; (B) five "combined" commissariats, each of which has parallel commissariats in the various participating states, chosen by the latter but approved by the federal commissars, whose authority is shared by them, viz.: (1) supreme council of national economy; (2) food; (3) labor; (4) finance; and (5) workers' and peasants' inspection. The 10 commissars at the head of these commissariats, together with a president and vice president, form the Union Council of People's Commissars. This body enjoys legislative and executive powers subject to higher authority. The whole country is under a single system of law and a single Supreme Court subordinated to the Central Executive Committee, whose presidium appoints 7 of the 11 members of the bench, and to which body the public

prosecutor may appeal cases for final decision. One of the members of the court is a representative of the United State Political Administration (O.G.P.U.). Under the constitution, each federated republic is required to function on a soviet basis, with a central executive committee and council of people's commissars. The Federation has exclusive control of foreign relations and alone may alter the external boundaries of the Federation; settle boundary disputes between participating republics; conclude treaties for admission of new members; declare war and conclude peace; negotiate foreign and internal loans for the Union, as well as give permission for such loans to the federated republics; regulate foreign and domestic trade; inaugurate the general economic policy of the Union, control industry and grant concessions in the name of the Union and of the separate republics; manage transportation, posts, and telegraphs; organize and command the armed forces of the Union; approve the budget and levy taxes; establish a monetary system; direct the use of land and all natural resources; control migration; shape civil and criminal legislation, labor laws, and educational and sanitary legislation for the Union; establish a system of weights and measures; issue federal statistics; promulgate legislation concerning the rights of citizens and foreigners; and grant amnesty throughout the Union. It has the power to annul any unconstitutional measure of the federated republics, and to settle any dispute between them. The federated republics retain the meagre rights of sovereignty and autonomy not withdrawn by the constitution Each may amend its constitution within the limits set by the federal constitution. No boundary of a republic may be altered without its consent. Any republic may withdraw at will from the Union. In short, the participating republics are given a semblance of sovereignty within their respective territories, while the absolute and final control of all important affairs, both foreign and internal, rests in the hands of the federal government in Moscow.

The Communist party with its 600,000 disciplined adherents is the ruling group in a nation of 131 000,000 people. Needless to say, there is no democracy in Russia. Suppression of the press and of free speech, drastic limitation of the suffrage, and terrorist methods are some of the means by which the present régime is maintained. The oligarchical control of the Communists is facilitated by a singularly effective indirect system of election. The electoral system of the soviets is ultimately based not on a territorial unit, such as a State, county, or township, but on an association unit, such as a factory, a soviet institution, a regiment, or ship, each body being dominated by a so-called nucleus of Communist party members, so that the perpetuation of the power of the Communist party is assured. Because of the impracticability of the economic unit system in rural communities, where each farmstead represents a unit, delegates are there elected from administrative units, i.e. the village or volost (group of villages); but due to the system of graduated elections in the case of rural communities, passing through several successive stages before members of the central congress (of a federated republic) are finally elected, whereas the cities and the larger industrial corporations send their representatives direct to the congress, the votes of the masses of peasantry are effectively submerged. Although a large or even overwhelming majority of the delegates elected on the primary ballots in any one province or district may be non-Communist, the final ballots turn out 100 per cent Communist representation in the supreme legislative body, the Central Executive Committee of the Congress of Soviets. At its annual meeting the Communist party elects a central committee of 40 members, which in turn elects a political bureau consisting of seven members and four alternates. Through this body the Communist party directs and controls the policy of the soviet government. Once a policy is decided on by the Political Bureau, it is referred to the Central Committee of the Communist party, which passes it as a matter of course and has it approved by the Central Executive Committee of the Union, which it controls absolutely. To prevent friction between the various important organs of party and state, the same Communists hold offices in a number of organs, thus creating a political interlocking directorate. In the last analysis, therefore, the real governing power in Russia is the Communist party.

Education According to the census of 1920 only 32 per cent of the entire population of Russia is literate. If children under eight be excluded, the percentage of illiteracy still amounts to 60. As in the case of all backward countries, the female population lags behind the male; there are 529 literate men to every 300 literate women. By locality, illiteracy increases centrifugally from Moscow toward outlying parts of Russia, particularly eastward toward Siberia, the Caucasus, and the Trans-Caspian Republics. Thus, in the Samarkand province of Turkestan the illiterate population constitutes 94½ per cent of the total. In Russia proper were registered 27,500,000 totally illiterate persons above the age of eight; in the Ukraine, 12,000,000; in the autonomous federated Republics, 6,000,000; with other districts, this makes a grand total of 54,000,000 above school age. By profession or occupation the highest standard of literacy was found in the soviet army, 826 per 1000, and in the navy, 942 per 1000. Taking the entire able-bodied working population of Soviet Russia between the ages of 16 and 50, there were 73 per cent of males and 36 per cent of females who could either read or write or both. A comparison between the returns of the literacy census of Russia in 1897 and 1920 shows up as follows:

	(Per 1000)			
	Male		Female	
	1897	1920	1897	1920
European Russia	326	422	136	225
Northern Caucasus	241	357	56	215
Western Siberia	170	307	46	134
General	318	409	131	214

The number of elementary schools, number of pupils, and percentage of girls, show the following developments since pre-war years:

School Year	Schools open January 1	Pupils Attending	Percentage of Girls
1910–11	55,000	3,552,000	32.4
1914–15	64,000	4,281,000	35.0
1920–21	70,000	6,060,000	42.0
1921–22	58,000	4,915,000	42.1
1922–23	53,000	4,400,000	37.1

Following the Bolshevik revolution, the Soviet authorities inaugurated an ambitious programme of popular education, but after 1921 all appropriations were curtailed to the minimum, and the number of schools as well as of pupils attending shrank in many cases far below prewar levels. In 1913, the proportion of the appropriations for the Ministry of Education and the general state budget amounted to 6.1 per cent, which rose as high as 7.5 per cent in 1916. These appropriations, however, covered only state-maintained colleges and primary schools but did not concern the great number of private educational institutions. Under the Soviet régime, no private schools are permitted except of the narrowly specialized type such as accountancy, shorthand, etc. It is part of the Communist platform that all Russian schools must remain in the hands of the state. In 1920, the appropriations for the Commissariat of Education amounted to 10.4 per cent of the total budget, but in 1921 they fell to 8 per cent, in 1922 to 4.2 per cent, and in 1923 to 3.4 per cent. The number of high schools or secondary schools likewise declined greatly. There were in the 1921–22 school year 1470 high schools with 199,676 pupils, but the number fell to 963 schools with 168,350 pupils in the year following. This change was partly accounted for by the transfer of a number of high schools into the category of combination primary and high schools, of which there were in the 1922–23 school year 572 with 211,574 pupils. The number of these schools which have a seven-year curriculum is increasing. The number of kindergartens fell by two-thirds in 1922–23 compared with 1920, from 2256 with 114,270 children to 839 with 40,450 children.

Higher Education. The number of colleges and specialized educational institutions in Soviet Russia in 1922–23 was 202 with 166,274 students. These were distributed as follows, by categories:

Category	Percentage of Colleges	Percentage of Students
Universities and colleges	14 4	37 8
Medical and veterinary schools	5.6	6 5
Normal schools	25 5	8 3
Agricultural colleges	14 4	13 1
Technological	18 8	20.3
Arts and music	13.1	6.4
Economic and industrial	5.6	5 8
All others	2 6	2 7

The great majority of colleges are located in the two capitals, Moscow and Petrograd, with 44.4 per cent of all students in Moscow and 30.8 per cent in Petrograd. The number of colleges and students increased in the two capitals but declined sharply throughout the rest of the country. In both the capitals, the number of college students amounted to 4 per cent of the population. The percentage of women students in colleges of general academic character was 52.4 (excepting the universities, where it was 45.3); in art schools and conservatories, 50.2; in medical colleges, 53.5; and as high as 69.2 in normal schools; in agricultural colleges, 25.9. The lowest proportion was in technological schools, 9 2 per cent. In addition to universities and colleges of the general type, there exist in Soviet Russia so-called "workmen's faculties" in which only Communists may enroll; the students are supported by a government stipend. On Jan. 1, 1923, 81 such "faculties" were open with 30,557 students. Of this number, 60 schools with 24,455 students were in the European part of the Russian Republic proper, of which 25 per cent were women. There were 20 such schools in Moscow and 9 in Petrograd, with a total of 14,867 students. Of a lower type than the academic and polytechnic institutes are the technicums, specialized institutions or courses giving an essentially practical training with greatly condensed theoretical background. These institutions are found mostly in provincial cities and like the workmen's faculties did not exist before the Revolution. In 1923 such schools numbered 359 with 49,586 students attending. The highest proportion were normal schools, 32.6 per cent, with 27.9 per cent of students, followed by manual training schools, 23.3 per cent of total number, with 26.7 per cent of the students; art and music, with 14.3 per cent of schools and 17.9 per cent of students. These institutions were the only ones whose number increased during the three years preceding. Their number grew from 255 in the 27 principal governments of Russia, with an average number of 127 students, to 272 in 1922–23, with an average number of 145 students. The percentage of women increased from 37.2 per cent to 42 per cent.

National Defense. The Soviet military establishment is directly under the Commissar of War and Navy, Leon Trotsky, and is controlled by the Supreme Revolutionary War Council (Revvoensoviet), which consists of 15 members and is attached to the Commissariat of War and Navy. It decides all military questions but delegates to one of its organs, the Political Administration of the Revvoensoviet (P.U.R.), independent decision over political matters. Before promulgation, every decree covering military affairs must be confirmed by the Council of People's Commissars. Declarations of war are made by the Union Central Executive Committee. The general staff of the Red Army is under the direction of the Revvoensoviet, the chief of the general staff designated by the Council of People's Commissars being an additional member of the Revvoensoviet. The commanding general of the army is under the direction of the Commissar of War and Navy, but he has complete power over military training and field operations. The strength of the regular standing army was 550,000, composed of 300,000 infantry, 60,000 cavalry, 95,000 technical troops, 25,000 artillery, 30,000 naval, and 40,000 various auxiliary troops. In addition to the above there were under arms 150,000 of the State Political Department (G.P.U.) troops, 60,000 in border units and 90,000 in interior units. Together with the four classes in the "changing personnel" of territorial divisions with 1,200,000, the total organized forces in 1924 numbered 1,900,000. Together with unorganized trained reserves, the total military man power amounted to 13,000,000. The proportion of the population trained for war service is 4.3 per cent. The most important positions in the army are held by members of the Communist party. In the cavalry 55 per cent of the regimental commanders are Communists; in the infantry 48 per cent; division and corps commanders, 66 per cent. Among the regimental and higher commanders, 22 per cent are old officers, 60 per cent officers commissioned during the War, 9 per cent graduates of red military schools, and 9 per cent of no special military education. Of the general

staff four-fifths of the members are old general staff officers who served during the War. Each unit of the army has its commissar, who must remain at least one year with his command. Each section has its club, and the regiment is provided with moving-pictures. Every squadron, battery, company, etc., has a nucleus of Communist soldiers, at the head of which is a political leader. The entire army is youthful; the average of officers commanding divisions is 30 years.

Naval See NAVIES OF THE WORLD.

Aeronautic. In 1924 there were 432 planes in the Russian air service and 36 balloons, of which 20 were attached to the field artillery, 10 to the coast artillery, and 6 to armored-train units. The air forces were divided into 12 squadrons, each of two groups of escadrilles. Each group was subdivided into 3 detachments of 6 planes each. There were 42 aërodromes, the chief one near Moscow, the centre of air activities The Russian air programme was most ambitious and planned to cover an increase to 5000 planes by 1926.

Agriculture. Approximately five-sixths of the population of Russia are classed as rural, and the problem of adjusting the theories of the Russian Revolution to meet the interests of this great class has been a source of much concern to the Soviet authorities. (See *History.*) The land expropriation which accompanied the Bolshevist uprising and its redistribution resulted in an increase in the landholdings of the peasantry from 70 per cent of the total cultivated acreage to 96 per cent in European Russia and from 55 per cent to 96 per cent in the Ukraine. In some districts of European Russia the dissolution of large holdings was still more drastic. For instance, in 36 provinces, according to data of the Central Land Administration for Nov. 1, 1920, out of a total of 22,800,000 dessiatines (1 dessiatine = 2.7 acres) of land not formerly tilled by the owners themselves, 21,400,000 dessiatines were distributed among the peasants, thus increasing their landholding (exclusive of forests) from 80 per cent of total to 99 per cent. On the average, the landholdings of the peasants increased from 1.87 dessiatines (5 acres) per capita of consumers ("mouths") to 2.26 dessiatines (6 acres), although in some districts this accretion is much smaller, down to fractions of a dessiatine. There remained in 1922 the following larger land units: (1) 5918 Soviet state farms, of a total area of 3,918,000 dessiatines, including 2,079,000 dessiatines in European Soviet Russia and 1,038,000 in Siberia and the distant border provinces, of which 1,158,000 dessiatines represent arable land; (2) 4,233,000 dessiatines controlled by 15,121 coöperative communes, with an average holding of 2.4 dessiatines per "mouth" and 3.7 dessiatines per worker. In the process of redistribution of land, not only had all the large landed estates been wiped out but larger peasant holdings disappeared as well. Between 1916 and 1919 the number of farm units of over 8 dessiatines (21.6 acres) declined from 8 per cent of the total number of farms to 3 per cent, and the group of farms comprising 4 to 8 dessiatines declined from 21.6 per cent to 16.4 per cent of the total. The percentage of pasture lands also declined from 11.4 per cent to 6.5 per cent. On the other hand, the percentage of small units under 4 dessiatines (10.8 acres) increased from 59 to 74 per cent of the total. As a result, small farms of less than 8 dessiatines comprise at present 90 per cent of the total farm holdings in the country.

Sown Area and Crops. Not over one-third of the total area of Russia, including Asiatic territory, is capable of agriculture, and much less is used. In European Russia most of the land suitable for use is occupied, much of it with very dense population. Owing to changes of boundaries, pre-war statistics cannot be compared directly with more recent statistics Eliminating lost territory and also Turkestan and Transcaucasia, an approximate comparison for all principal cereals and potatoes shows, for 1913, 245,700,000 acres; 1916, 223,020,000; 1920, 173,716,000; 1921, 161,811,000; 1922, 136,609,000; and 1923, 162,070,000. In calculating the yield per acre from local reports, which are made up according to the five-mark system (1 = poor; 2 = unsatisfactory; 3 = medium; 4 = good; 5 = excellent), the Central Statistical Bureau admitted an underestimation about 6 per cent, on the strength of the actual crop data for a number of years, as compared with the totals figured out by the five-mark system. Moreover, it was found that certain corrections were needed for local reports of sown acreage, because of the tendency of the peasant taxpayers to understate the extent of acreage planted by them. These corrections were found to range between 5 and 10 per cent, or an average increase for the entire country of 7 per cent. The evolution of the total sown area of Soviet Russia, exclusive of Turkestan, and of the Ukraine, inclusive of field crops and potato crops converted into grain equivalents at the rate of 4 poods to 1, from 1920 to 1923, is shown in the following table:

	1920	1921	1922	1923
			(Dessiatines)	
Russia in Europe	37,495,300	35,422,400	31,446,600	37,941,500
Kirghizia	3,273,600	2,385,800	1,822,000	1,697,900
Siberia	5,756,300	4,307,800	3,074,200	3,677,000
Total Asiatic Russia	9,029,900	6,693,600	4,896,200	5,374,900
Total Soviet Russia	46,525,200	42,116,000	36,342,800	43,316,400
Ukraine	17,814,100[a]	17,814,100	14,253,000	16,709,500
Total Soviet Union:				
In dessiatines	64,339,300	59,930,100	50,595,800	60,025,900
In acres	173,716,000	161,811,000	136,609,000	162,070,000

[a] Estimated.

After introducing corrections as mentioned above, the 1923 sown area of Soviet Russia and the Ukraine would be represented at 65,590,300 dessiatines or 177,094,000 acres, of which 41,629,100 dessiatines are in European Russia; 17,-

963,400 in the Ukraine; and 5,997,800 in Asiatic Russia Compared with pre-war area, the revised 1923 estimates of the Central Statistical Bureau amount to 73 per cent of the official estimates of the 1913 area. The ratio of acreages planted in 1923, as revised by the Department of Agriculture (increased by 20 per cent), to official data of 1913 (increased by 10 per cent), taken as 100, are as follows: rye, 95; winter wheat, 72.7; spring wheat, 38.9, oats, 58.4; barley, 59.6; buckwheat, 120; millet, 163.6; corn, 177.8. The gross crop of the seven principal cereals, rye, wheat, barley, oats, buckwheat, millet and corn, is estimated for 1923 according to the basic data of the Central Statistical Bureau at 2,153,000,000 poods, and with the above corrections for yields per acre and for sown acreage at 2,432,000,000 poods; with the addition of all other crops, including potatoes, in grain equivalents (1 pood for 4), at 2,795,000,000 poods without correction, and 3,147,000,000 poods, corrected as above. In the following table the gross crops of principal cereals are compared for the four years 1920–23, without correction:

	1920	1921	1922	1923
	(In millions of poods)			
European Russia	1,075	842	1,263	1,178
Asiatic Russia	254	214	193	165
Ukraine	779	633	755	808
Total	2,108	1 689	2 211	2,151

It is thus found that agriculture in Russia was being rapidly restored, and with three or four years of fairly satisfactory crops, it might be expected to reach pre-war proportions. It is the one line of production where human enterprise and endeavor have been practically unaffected by the Communist régime from the start and given more freedom and opportunity to dispose of their output and to export the surplus production of grain, the peasantry would attain greater prosperity than they ever enjoyed in the past and would thus enhance the general level of prosperity of the entire nation.

and the Far Eastern Republic (about 227,000,000), or a total of 5,205,000,000 rubles. Thus the gross value of the 1923 agricultural production amounted to 67 per cent of the pre-war. Compared with the production for 1922, it represents an increase of 11 per cent. Up to 1924, under the monopoly of foreign trade, the Soviet state institutions were the ultimate purchasers of all grain for export, and the exports of cereals, resumed tentatively in 1922 for the first time since the outbreak of the War, had attained considerable proportions in 1923. The exports of cereals in 1913, in bushels, were: wheat, 122,124,420; rye, 25,418,400; barley, 179,886,350; oats, 41,187,500; all cereals, 11,728,000 tons. In 1922 the grain exports were practically nil; the imports for famine relief were considerable. In 1923 the exports of rye were 47,440,250 bushels; wheat, 12,192,000; barley, 10,053,000; oats, 7,048,400; all cereals, 2,191,080 short tons. Exports of tobacco, 1913, 28,480 short tons; 1923, 2380; flax fibre and tow, 1913, 6060; 1923, 37,200; hemp, 1913, 74,340; 1923, 4840. The total value of grain exports alone, in 1923, was estimated at 107,127,000 rubles (at 1913 prices), as against 602,684,000 in 1913 (including flour not exported in 1923); these were the chief factor in restoring the favorable trade balance for Soviet Russia, especially during the last quarter of 1923. They indeed comprised 52 per cent of the total exports for the year.

Live Stock. The ravages of famine and civil war greatly decimated the working live stock and dairy herds of Russia Energetic measures were taken by the Soviet authorities to avert the peril to agriculture resulting from a shortage of horses and working cattle, with the result that the year 1923 showed an improvement for the first time since 1914 It must be pointed out that the herds of cattle, and especially the horses, had been considerably reduced even prior to the Bolshevist Revolution, due to war conditions. The movement of stocks during the decade from 1914 is illustrated in the following table:

	Russian Empire within present Soviet boundaries	Same, excluding Eastern Siberia Turkestan, and Transcaucasia [a]		
	1914	1921	1922	1923
Horses	31,312,172	23,670,000	18,977,000	19 700,000
Cattle	44 708,570	38,132,000	32,977,000	38,600,000
Sheep and goats	78.721,038	47,157,000	41,298,000	56,500,100
Swine	13,550 846	13,501,000	7,658,000	9,100,000

[a] Turkestan and Azerbaijan, according to the census of 1920, contained 830,000 horses, 2,048,000 cattle, 16,408,000 sheep and goats, and 102,000 swine

The total value of agricultural production in 1923 is estimated by Soviet statisticians at 4,772,000,000 rubles. The average pre-war production for the years 1911–13 was estimated at 9,500,000,000 rubles for the Russian Empire, and deducting 18 per cent for the Succession States separated from Russia, at 7,800,000,000 rubles. The total value of 1923 production is distributed as follows: cereals, 2,191,000,000 rubles; potatoes and sugar beets, 226,000,000; fibre plants, flax, hemp, etc., 95,000,000; oil seeds, 177,000,000; tobacco and vegetable truck, 440,000,000; cattle and poultry, 1,325,000,000; fodder grasses, 202,000,000; orchards and vineyards, 116,000,000; total, 4,772,000,000 rubles. To this must be added the value of gross production of Transcaucasia (about 150,000,000), Turkestan

Forest Area. According to the latest data, compiled in the summer of 1923 by the Commissariat of Agriculture, the area under timber in Soviet Russia is represented as follows: Russia in Europe, 398,024,585 acres; Western Siberia, 992,383,988 acres; Far Eastern territory, 313,537,835 acres; a total of 1,703,946,408 acres. Of this amount 1,107,296,263 acres are estimated as exploitable forest. Due to the uneven distribution of forest land over the entire territory, timberland available for normal consumption of the population varies widely in different sections. The timber resources available for felling amount annually in Siberia to 120,508,000,000 board feet, and in the Far Eastern territory to 31,374,000 acres, while for the entire Russian territory they are estimated at

255,130,000,000 board feet. Only a small portion of timberland had been properly surveyed up to 1924.

Fisheries. Prior to the War the Russian fishing industry occupied, in volume of production, the second place in the world. In 1913 the year's catch of Great Britain amounted to 12,330,000 long tons, Russia coming next with 73,215,000 poods or 11,840,000 tons (62 poods = 1 long ton). In addition to its domestic catch, Russia imported annually about 25,000,000 poods of fish, bringing the total yearly consumption to about 100,000,000 poods. Following the Bolshevist Revolution, the catch in 1918 dropped to 5,000,000 poods, but subsequently increased year by year and amounted to 7,000,000 poods in 1919, 8,000,000 in 1920, 11,000,000 in 1921, and 18,000,000 in 1922. The last figure represents the output of the state fisheries only. Adding to this total about 8,000,000 poods, representing the output of the fisheries operated by private concerns under lease from the state and that of independent fishermen, the total output for 1922 amounted to about 26,000,000 poods or 35 per cent of the pre-war figures The total value of exports of fish and caviar in 1914 amounted to 2,512,000 rubles; that of imports, 27,419,000 rubles. In 1922 imports of fish amounted to 11,384,000 rubles, at pre-war prices; exports of caviar, 925,000. The improvement was especially marked in the fishing industry of the Lower Volga and the Caspian Sea, whence comes practically all the fall catch and where are found the most valuable species of red fish, i e. sturgeon and salmon, and white fish, and where the great caviar industry of Russia was concentrated. The average output of the district for the five years 1908–13 amounted to about 3,000,000 poods. The catch of 1919, under conditions of conscription of the fishermen and fisheries' employees, amounted to about 500,000 poods, which increased in 1920 to 1,650,000 poods. Under the Soviet decree of May 31, 1921, the so-called "new economic policy" was introduced in regard to the Astrakhan fisheries: the management was freed from interference of any kind from administrative bodies, which thitherto had exercised control in one form or another over the activities of the fisheries, with the result that both the number of fishermen and their output showed a sharp increase, thus, the number of fishermen registered in the fall of 1921 amounted to 27,000, against 6000 in the fall of 1919, and 10,000 in 1920. The average output of the fishermen increased from 36 poods in 1919 to 88 poods in 1921. Along with the independent fishermen, the employees of the fisheries were likewise removed from universal labor duty and put on straight output pay. The results were shown in the per capita output of the men and the output per net. In the fall of 1920, 18,000 fishery employees handled 1,650,000 poods of raw fish, or about 90 poods apiece, while in the fall of 1921 approximately 10,000 fishery employees handled 2,783,000 poods, or about 278.5 poods apiece. The Astrakhan catch of 1922 amounted to 3,400,000 poods, thus exceeding the pre-war average Of this quantity, 68 per cent represented the output of state-operated and state-leased fisheries; the remainder was brought in by independent fishermen.

Industry. In proportion as the fundamental communistic principles of compulsory service, subsistence rationing, and productive work "for the good of the commonwealth and not for profit" were discarded (see *History*), an ever closer approximation was sought to "business management methods" and industrial efficiency in state-operated enterprises. As the load factor of now one and now another of the nationalized industries fell to the danger point, threatening complete breakdown, heroic measures were resorted to in order to stimulate production by throwing all available resources in that direction, generally at the expense of other nationalized industries. This policy of spasmodic forced stimulation of output of separate works, or groups of plants, led inevitably to perpetual breaks and slumps, and to forced curtailment of the number of state employees; to the cutting down, again and again, of minimum wage scales, and finally to the transfer of practically all the industries from direct state management to that of "trusts" and "syndicates" specially organized by the government and left to shift for themselves in the matters of providing operating funds and marketing their product. The Bolshevist contention is, however, that while the socialistic basis of production "for the good of the commonwealth" has been abandoned for the capitalistic system of operation for "profit," the distinction between state capitalism in Soviet Russia and the individualistic capitalism of the rest of the world lies in the fact that the profits accruing from the operation of the trusts, at the expense of labor, are in the case of the Soviet republics supposed ultimately to return to the proletariat, which controls the state, and through it, the state trusts. Since the inception of the "new economic policy" (see *History*) two contrary developments have manifested themselves in the trend of industrial production: on the one hand, the continued process of exhausting the means of production in industry; on the other, the improvement in the organization of industrial processes and of exchange. This improvement is expressed in increasing productivity of labor, concentration of production, and gradual organization of the processes for disposing of output; better organization of transport services; embryonic appearance of credit; improvement in the financial apparatus for collecting taxes; and the decreased share of paper currency in the national budget

Of the factors contributing to the increased output, the chief is found in the satisfactory crops of 1922 and 1923, and low prices for bread and fodder; these enabled wages almost to double in the course of 1922 and thereby enhanced the productivity of labor. The improvement in the supply of foodstuffs in the cities checked the migration of urban population to the country and started a new movement of population from the villages cityward Another factor is found in the curtailment of importation of foreign goods since the fall of 1922, owing to the systematic policy of the Soviet government In addition, the industries were supported by state contracts: but above all, the state issued considerable subsidies to the industries The sum total of subsidies thus appropriated and issued during the fiscal year 1921–22 amounted to 160,000,000 gold rubles, and in 1922–23 to 175,350,000 rubles, to which must be added the indebtedness to the state-controlled banks, which amounted at the close of the operating year (Oct. 1, 1923) to some 186,500,000 rubles. Notwithstanding the increased output and the great dearth of manufactured goods in the home mar-

kets, the anomalous costs of production, especially in overhead costs, rendered the prices prohibitive to the great mass of the population, and all industries continued operating at heavy deficits. In order to reduce the burden of support by the state for the basic industries, curtailment and concentration were resorted to periodically; production in every industry was centralized as far as possible at a few of the higher plants, which retained the best equipment and were most advantageously situated as to supply of raw materials, transportation, and marketing facilities. An increase of output and greater productivity per unit compared with previous years resulted from more efficient management and the concentration of production, are used over again in further manufacturing, the gross value of commodities in 1921–22 and 1922–23, as comparable with 1913, is shown in the following summary. These totals, expressed in pre-war gold rubles, do not cover the entire field of industrial production but only that part of it for which more or less closely comparable data can be presented for the three years under survey Thus, the total value of production of major industries for 1922–23 is calculated at 1,077,716,600 pre-war gold rubles, while, according to the data of the *Statistical Bulletin of the Council of National Economy*, which purports to cover approximately 80 per cent of the industrial enterprises, the value of production is estimated at 1,196,347,000 rubles.

Branch of Industry	1913	1921-22 (In gold rubles)	1922–23
Fuel (coal, oil)	410,551,400	180,396,400	202,576,600
Ore mining	133,546,800	11,796,600	18,928,500
Silicate (glass, cement)	87,598,000	9,882,200	17,296,700
Metals	726,700,000	86,998,200	148,594,000
Electro-technical	32,166,700	14,918,400	25,880,700
Electric power plant	.... ..	14,055,700	18,415,000
Textile	825,900,000	215,560,800	327,625,700
Leather and shoes	68,214,900	55,145,300	56,032,900
Chemical, including rubber and dyes	185,973,100	54,617,200	86,189,100
Foodstuffs	720,539,100	55,822,000	96,200,500
Woodworking	135,706,000	21,470,000	56,101,600
Paper	57,250,600	10,925,700	23,876,300
Total	3,384,146,600	731,648,300	1,077,717,600
Percentage	100	21 6	31.8

in spite of the heavy deficits incurred and the accumulation of unsold stocks.

Volume of Later Industrial Production. The volume of production of the basic industries in 1922–23, as compared with the preceding year and the pre-war output, can be summarized as follows:

Items	1922–23 Short tons	1921–22 (2000 lbs.)	Per cent of increase	Per cent of 1913
Coal	11,642,600	10,613,720	10	37 1
Iron ore	470,700	299,750	57	4 6
Manganese ore	78,700	30,290	160	5 7
Petroleum	5,635,500	4,940,430	14	55.4
Pig iron	332,380	187,960	75	7 2
Open hearth steel ingots	647,110	350,340	84	13 8
Cotton yarn	76,930	54,130	42	26 6
Linen yarn	30,200	17,790	73	80 0
Woolen yarn	15,580	12,460	25	36 0
Paper	75,500	29,230	160	46 0
Basic chemicals[a]	221,400	132,700	67	40 0
Sugar	410,430	227,140	80	27 5

[a] Acids, alkalies, salts, and fertilizers.

While substantial gains in varied measure are thus seen to have been made in the quantity output for 1922–23 as compared with the preceding year, and in respect of pre-war levels, a comprehensive estimate of the degree of aproximation to the production of wealth in 1913 can be arrived at by summing up the values of commodities produced during the years 1921–22 and 1922–23 in relation to the aggregate value of pre-war production.

Value of Later Industrial Production. It has been calculated that the net production, or increment of wealth, in 1913 by the major industries, after deducting the cost of raw materials and of fuel consumed, amounted to 2,657,000,000 gold rubles. Taking the production of the entire manufacturing industry, including all enterprises employing 16 workers and over, with mechanical equipment, and excluding the value of semifinished goods, representing the output of certain of the units, when these materials These parallel data show a gain in the value of the last year's production of more than 40 per cent as compared with the previous year, and a close approach to one-third of the pre-war total.

Leased Enterprises. With the inauguration of the "new economic policy" a certain number of enterprises of minor importance were set aside for leasing to private interests. Up to Oct. 1, 1923, a total of 5241 plants, or 72 per cent of the total originally listed for leasing, passed from direct State control. The leased enterprises belonged exclusively to the category of small workshops, with an average employment of 16 persons Only 30 per cent of the total leased were taken over by former owners and 22 per cent by other private parties, 11 per cent are operated by various State organizations as side lines; 23 per cent by cooperative associations, and 14 per cent by labor associations By groups of industries the leased shops are divided as follows: production of foodstuffs, 1770, tanneries and leather workshops, 1556; metal-working, 602; textiles, 336; printing trades, 317. The total output of the leased enterprises in 1923 was negligible, amounting in value to less than 4 per cent of that of the state-controlled enterprises. This does not include, however, the unorganized handicrafts and home industries, which competed successfully with the state industries, and whose output reached considerable proportions.

Labor and Wages. In 1917 the total number of workers employed in all industries amounted to 3,308,000. By 1921 it shrank to 1,614,370. It continued falling until the end of 1922 and reached in October a total of only 887,500. After that the number of workmen began increasing, and a total of 1,037,500 were registered in September, 1923. While this increase was recorded, the number of unemployed in the cities kept growing at an even faster rate, and by Jan. 1, 1924, was reported at about 1,250,000, from a little more than one-third of that number re-

corded at the beginning of the year. This apparent paradoxical condition is accounted for by the growth of industries during 1923. Increasing industrial activity created a returning tide of skilled workers, which ebbed away during the communistic régime and became scattered among the home handicrafts, the villages, peddling (the so-called "bagmen"), etc. The heavy slump in the prices of agricultural produce on the one hand, and the rise in wages of factory workers on the other, all stimulated the drift of labor to the cities. From an average wage of the Russian worker amounting to 33 rubles in 1913, the monthly wage fell to 9 rubles in 1918, and as low as 6.7 rubles per month in 1919. This rate of wages was obviously insufficient for subsistence. During these years the workmen systematically expended more than they earned, eking out their wages by all manner of illegal practices, petty pilferage, speculation, outside work, etc. By September, 1923, according to the data of the Central Statistical Bureau, the average wage of the Russian worker in the manufacturing industry reached 11 rubles per month, of which 1.80 rubles were received in kind In all the mining and metallurgical industries the average wage rate in September, 1923, was 8.90 rubles, with 2.20 rubles in kind In the coal-mining industry specifically the average wage was 8.50 rubles. Compared with pre war earnings the average monthly wage rates in October, 1922, and September, 1923, in percentages of the average rates of 1913, in various industries, are represented as follows:

PERCENTAGE OF 1913 WAGE RATES		
Industry	October, 1922	September, 1922
Metal working	30 1	48 7
Woodworking	34 8	58.0
Glass, china, cement	30 4	55 8
Chemical	53 6	93 2
Foodstuffs	79 0	158,6
Leather	50 8	76.6
Textile	32.8	65.5
Paper	51.1	93 8
Printing trades	58 9	89.5
Average, manufacturing industries	36 7	67.9

Thus in all the branches of the manufacturing industries a substantial increase in wage rates was recorded during 1923. Actual wage receipts, however, fell about 25 per cent short on the average of payments due. In the coal-mining industry, on the other hand, the wages decreased from an average of 9.50 rubles per month in October, 1922, to 8.50 rubles in September, 1923.

Foreign Trade. Foreign trade in Soviet Russia is a state monopoly and is carried on by the Commissariat of Foreign Trade through various official institutions and branches within the Soviet Union, which are represented by foreign trade delegations abroad, chiefly at Berlin and London, and by corporations organized under the laws of the respective countries in the form of commercial companies, whose entire stock, however, is held by the Soviet government. With the expansion and ramification of foreign trade operations, it became impossible for the central Commissariat to handle the entire volume of trade, and a system of licensing the largest commercial and industrial bodies to carry on their trading operations independently of the Commissariat was resorted to. During the year 1923, several private concerns also were authorized to carry on the foreign trade within certain limitations as to the nature and the outside amount of imports permissible and subject to an equal division of all profits with the Soviet government. Until the year 1923, the trade balance was heavily adverse, due to Russia's inability to produce sufficient surplus for export, especially of grain, which formed the bulk of pre-war exports. With the satisfactory crops of 1922 and 1923, however, exports of grain were resumed, and along with the severe restrictions of imports they enabled the government to close 1923 with a favorable balance. In the following table, tracing the volume of imports and exports during pre-war years and since 1920 (foreign trade was practically suspended during the years immediately following the Revolution), the entire volume of trade is figured in gold rubles at 1913 prices. This figuring is rendered necessary by the failure of the rapidly depreciating Soviet currency to furnish a stable medium for calculating a comparison.

Years	Imports	Exports
Average 1909–13	1,139,654,000	1,501,421,000
1913	1,374,034,000	1,520,135,000
1920	28,000,000	2,400,000
1921	210,003,000	20,195,000
1922	269,799,000	81,620,000
1923	144,056,000	205,818,000

Thus the favorable balance of trade obtained in 1923, the first under the Soviet régime, amounted to 61,672,000 rubles. On the basis of approximate current prices instead of 1913 prices, the exports totaled 307,300,000 rubles and the imports 200,100,000 rubles; this made the favorable balance, on a contemporary basis, equal roughly to 107,200,000 rubles. In addition to commercial imports, famine relief supplies to the value of 34,400,000 rubles were imported during the calendar year, as against similar imports of 183,800,000 rubles during the calendar year 1922. The imports underwent a change in composition. Whereas over one-third of the imports of 1922 consisted of foodstuffs, exclusive of contributed famine relief supplies, the imports of foodstuffs in 1923 amounted to but 7.4 per cent of the total. In 1922 the imports of raw materials and semimanufactured products represented only 14 6 per cent of the total, whereas in 1923 this group accounted for 44.2 per cent of the total At the same time exports showed a corresponding shift: for the group of foodstuffs, from 5 3 per cent in 1922 to 56.8 per cent in 1923; for raw materials and semifinished goods, from 90 8 per cent to 42 4 per cent of total. The general distribution of Russian exports in 1923 by groups of commodities is thus found to be closely approaching that of 1913, when foodstuffs accounted for 52.2 per cent of total exports, and raw materials and semifinished goods accounted for 36 9 per cent, these two groups comprising the bulk of Russian exports. The similarity is extended further to the two principal markets of Russian foreign trade, Germany and the United Kingdom. In 1913 these two countries accounted for 60.1 per cent of total Russian imports, and 47 4 per cent of total exports; in 1923, their share was 60 and 44.2 per cent, respectively. The government monopoly of foreign trade was firmly maintained. According to data for the operating year 1922–23, Soviet state institutions, including government organizations and mixed companies controlled by the Soviet government, ac-

counted for 96.7 per cent of all exports and for 97.3 per cent of all imports; the rest represented the part played by purely private initiative in the foreign trade of Soviet Russia.

Finance and Currency. The process of currency inflation and depletion of the gold stock in Russia started soon after the outbreak of the War. The Imperial régime, however, increased the outstanding notes only moderately and did not differ in this respect from the inflation policy prevailing in almost all belligerent countries. Shortly after the outbreak of war, the statutory restriction which provided that the paper money issued by the Imperial Russian Bank should not exceed its gold reserve by more than 3,000,000,000 rubles was abolished, and the right to convert paper rubles freely into gold was abrogated. On July 27, 1914, the outstanding notes amounted to 1,633,000,000 gold rubles and were covered by 1,744,000,000 gold rubles, a reserve of 107.4 per cent. During the three years and four months between the outbreak of war and the inauguration of the Soviet régime, the paper in circulation increased over clevenfold. The Soviet decree of July 25, 1918, made "the purchase, sale, or possession of precious metals in bullion or gold punishable by imprisonment of not less than 10 years in hard labor and the confiscation of the entire property of the culprit." The only currency authorized was the Soviet paper ruble, not backed by any reserve or security but circulating by virtue of its acceptance by all government institutions, trusts, and trading-stores. With the inauguration of the "new economic policy" and the legalization of private trading, the Soviet ruble began to depreciate rapidly. When trade with the outside world was resumed, involving purchases on a large scale from the peasantry and the concomitant exhaustion of the gold reserve appropriated by the Soviet government, heavy budget deficits began piling up; these were met by more issues of paper money, and inflation assumed gigantic proportions.

The decree of Oct. 17, 1920, designated the possession of gold, silver, platinum, foreign exchange, etc., as legal, but subject to compulsory delivery to the state against a compensation fixed by the Commissariat of Finance according to average market value. All transactions in valuables or currency were still completely prohibited. The decree of Nov. 18, 1921, granted to the State Bank the monopoly of purchase and sale of foreign currency and precious metals in coin and bullion. From this indirectly followed the right to sell money or valuables to the State Bank but not to purchase them from the Bank. The decree of Apr. 4, 1922, abrogated the principle of compulsory delivery to the state of property in precious metals or foreign exchange; but it permitted the free circulation of precious metals in the form of bullion only, leaving in force the monopoly of the State Bank on the purchase and sale of coin and foreign exchange. By decree of July 27, 1922, state and coöperative institutions were permitted to accept gold or precious metals in coin in payment for goods or services, provided immediate deposit thereof was made to their accounts with the State Bank.

In December, 1922, the issue of so-called "chervonets" banknotes by the State Bank was authorized; these eventually became standard currency. These notes of 10-ruble denomination were secured according to law by gold, silver, and stable foreign exchange, to the extent of not less than one-quarter of face value, the balance being covered by drafts, notes, warehouse receipts, and other transferable collateral. However, ever since the inception of its note issue the State Bank has maintained the gold security in reserve of the chervonets notes at 50 per cent of face value. The decree of Jan. 29, 1923, abolished the monopoly of the State Bank on purchase and sale of foreign currency and admitted trading in gold and silver bullion, in foreign currency, and in checks and bills of exchange. The chervonets notes have retained their parity with the gold ruble in terms of Soviet currency and circulate at par with the pound sterling and practically so with the dollar. At the same time, the sound or purchasing value of the entire mass of paper ruble currency outstanding was dropping precipitously. On Jan. 1, 1923, it was estimated at 101,900,000 gold rubles; on June 1 at 88,702,000; on Jan. 1, 1924, at 59,500,000; and on February 1 at only 39,000,000 rubles. The total Soviet paper money in circulation on Jan. 1, 1924, was about 178,000,000,000,000,000 rubles. Of this astronomical amount, 31,000,000,000,000,000 had been issued in October, 45,000,000,000,000,000 in November, and 80,000,000,000,000,000 in December. By Jan. 1, 1924, chervonets banknotes assumed a predominant position as a medium of exchange. A series of decrees promulgated during the last week of February and during March, 1924, introduced a reform in the Russian monetary system. By a decree effective on February 15, the Soviet paper ruble was abolished, and the chervonets banknote was made standard currency. By the second and third decrees issued on February 29 to regulate application of the first decree, the system of reckoning in index rubles based on 1913 prices was abolished, and the payment of fixed wage rates in chervonets rubles was substituted for their payment in Soviet currency, as based on the cost of living index. On Mar. 10, 1924, announcement was made that Soviet paper currency would be redeemed for chervonets notes at the rate of 500,000 rubles of 1923 issue (each of which is equal to 1,000,000 original Soviet rubles), for one chervonets ruble. Treasury bills of 1, 3, and 5 ruble denomination were put in circulation instead, not backed by any security but exchangeable for chervonets notes at any of the state-controlled banks. In addition, silver and copper coin was put in circulation. By May 1, 1924, there were issued 87,000,000 rubles of the new Treasury bills, 20,000,000 rubles of silver, and 3,000,000 rubles in copper, a total value of 110,000,000 rubles of fractional currency; the amount of chervonets banknotes in circulation rose to 305,000,000 rubles, making a total of 415,000,000 rubles in circulation, with the fractional currency amounting to about 25 per cent of the total as against 40 per cent prior to the War.

The budget of 1922 (nine months, January-September) was balanced with a deficit of 139,000,000 rubles, covered entirely by the issue of fiat currency. The budget of 1922–23 was balanced with a deficit of 572,000,000 chervonets rubles, only partially met by the issue of 390,000,000 rubles of fiat money and 129,000,000 rubles of various short-term loans and by the sale of foreign currency held by the State Bank. The budget estimate for 1923–24 passed at 1,708,000,000 chervonets rubles and an estimated deficit of 432,000,000 rubles. To cover this de-

ficit, about 180,000,000 rubles of Treasury bills were to be issued, and the balance was to be met by short-term loans, increased taxation and greater income anticipated from nationalized properties and railroads. Bank deposits increased nearly tenfold during 1923, from 21,980,000 chervonets rubles on Jan. 1, 1923, to 216,080,000 on Jan. 1, 1924.

Transportation. The following data on railroads for pre-war years cover the entire Russian Empire and should be reduced by 15 to 25 per cent for comparison with the 1924 territory. Main-track mileage at the end of 1914 was 43,850 miles, of which 6330 were in Congress Poland and the Baltic Succession States. The mileage in 1922 within Soviet boundaries was 42,357 miles

Condition of Rolling Stock. The number of locomotives at the beginning of 1914 was 20,057, with an average of 15 per cent under repairs. In September, 1923, the total number was 19,642, of which 8576 were sound and the rest disabled. Number of freight cars in 1913–14: 550,000; in September, 1923: 414,950; of these, 290,540 were in sound condition The number of passenger cars in September, 1923, was 24,165, of which 12,760 were disabled. Total work of railroad transport in 1913, including freight trains, railroad service trains, and military transport trains, was expressed in 46,065,000,000 ton miles and 18,120,000,000 passenger miles. During the 1922–23 operating year, traffic amounted to 16,470,000,000 ton miles, of which 9,787,000,000 ton miles represented paid goods traffic; passenger traffic amounted to 9,026,000,000 passenger miles. Average daily loadings of cars amounted in 1914 to 75,000, in 1921 to 10,900; in 1922 to 9770; and in 1923 to 11,821. Thus the average load factor of the freight traffic was a little over one-third of the pre-war figure, but this was very unevenly distributed so that on the trunk railroads in the central parts of Russia the load factor reached and even exceeded one-half of that of 1913. In the outlying regions, as Siberia and the North, the load reached barely 10 to 20 per cent of pre-war. This necessitated the support of the poorly-loaded lines at the expense of those more actively exploited.

Condition of Trackage. The campaign of systematic introduction of four standardized types of rails on the Russian railroads had not been completed by the time the War broke out. Consequently a diversity is found in regard to weight of rails, even within trunk lines of the same system. As the replacing of rails by heavier types had been lagging behind the replenishment of motive power by new locomotives, the 1924 condition of track did not correspond to the demands imposed by traffic. The heavier rails in service in 1924 were from 13 to 16 years old, while the lighter types had been in service from 40 to 50 years, with an average service limit of 33 years under pre-war conditions of traffic. The status of rail fastenings, spikes and bolts, was even worse. Such a condition of the roadbed made it continually imperative to reduce the speed limit of trains. The official programme of trackage improvements provided for replacement of 140,000 tons of rails during the first year, 1922–23. On account of conditions in the steel industry, only about 85,000 tons were provided during that time; hence, the replacement programme will have to be considerably extended.

Railroad Personnel, Wages, and Receipts. In the middle of 1921 the number of railroad employees was 1,256,767; on Jan. 1, 1922, it had been reduced to 907,000; on Jan. 1, 1923, to 708,000; but by Oct. 1, 1923, it had risen again to 900,398. The number of men employed per mile of track amounted in January, 1921, to 30; in January, 1922, to 22; in January, 1923, to 17.3; in October, 1923, to 21.4; the monthly average in 1913 was 19.35. In October, 1922, the wages of railroad workers in Russia averaged 6.63 gold rubles (index basis) per month (1 ruble = $0.5146); in March, 1923, 9.65 rubles; in the following June, 9.80 rubles. The increase of wages was especially noticeable in the railroad workshops, where it reached almost the average wage of a metal worker in Soviet Russia, 14 rubles per month. Railroad workers still remained the lowest-paid form of labor in Russia. By June, 1923, their average wage still amounted to only 43.3 per cent of pre-war levels, whereas the comparative rate for industrial workers reached 57.5 per cent. Prior to the War the earnings of railroad labor averaged about 50 per cent above those of industrial labor, 36 rubles per month, as against an average of 20 rubles for industrial labor. The gross receipts of railroads for the 12 months ended Sept. 30, 1923, amounted to 205,000,000 gold rubles on the index basis. During the same period state subsidies to the railroads totaled 86,000,000 rubles, while the total subsidies granted during the year to the State Transport Service as a whole, i.e. including water transport, etc., amounted to more than 126,000,000 index rubles, or expressed in actual chervonets or gold currency, to 157,000,000 chervonets rubles. This sum represented almost one-third of the entire budget of the entire Transportation Service.

Internal Waterways. The length of navigable mileage in European Russia amounts to 25,545 miles and in Asia to 30,100 miles, besides longer mileage suitable for rafting purposes only. The river fleet in 1913 within the 1924 Soviet borders consisted of 3925 power-driven cargo boats of 682,528 aggregate indicated horse power; 20,573 sailing and other vessels, with a total capacity of 12,907,000 long tons. In 1923 there were 716 power-driven vessels of 187,120 horse power, including 150 oil tankers of 72,180 horse power, 314 passenger steamboats of 102,786 horse power, and 2408 sailing and other vessels of a total capacity of 2,316,000 long tons, including 366 oil barges of 1,025,000 tons capacity. The volume of river transport in 1913 was 44,364,000 long tons and 11,041,300 passenger; in 1923, 10,218,000 tons, including 3,038,000 tons of oil cargo and 8,087,185 passenger

Merchant Marine. In 1914 there were 1005 steamships, averaging 826 tons gross registry, of average capacity of 487 tons; 55 motor-driven vessels of 380 tons deadweight average, and 238 tons average capacity.

History. The outbreak of the War in August, 1914, produced a mighty demonstration of Russian Pan-Slavism. Internal dissensions and strikes were submerged in a wave of patriotism. The Duma, usually so critical, rallied to the support of the Czar, and the representatives of dissentient nationalities made striking asseverations of loyalty. All Russian political groups, with the exception of the Bolshevist wing of the Social Democratic party, expressed their resolution to spare no effort in assisting the government to maintain the country's integrity and dignity and to defend coreligionists and kins-

MERCHANT MARINE, 1922

Distribution	STEAM-DRIVEN Number	STEAM-DRIVEN Capacity (Long tons)	SAILING AND MOTOR-DRIVEN Number	SAILING AND MOTOR-DRIVEN Capacity (Long tons)

Total*	992	280,660	434	94,025
Average capacity		282		216

*There were, in addition, 560 barges and lighters. The principal ports were as follows: on the Baltic Sea, Petrograd; on the Black Sea, Odessa, Batum, Nikolaiev, Novorossiisk, and Marioupol; on the White Sea, Archangel, on the Caspian Sea, Astrakhan; and on the Arctic Ocean, Murmansk.

men abroad. Even leading anarchists espoused the national cause with spontaneous enthusiasm. The government on its side made some attempt to conciliate discontented minorities. The struggle with the Finnish Diet was suspended; the Poles were promised, by proclamation of the generalissimo, Grand Duke Nicholas, a grant of early autonomy and ultimate reunion under the Russian sceptre with their fellow-nationals of Germany and Austria; and restrictions on Jews, Catholics, and Lutherans lapsed temporarily. The permanent abolition of the sale of vodka decreed shortly after the beginning of hostilities met with widespread popular support. Large social groups were organized to aid in the prosecution of the war: local provincial councils formed the All-Russian Union of Zemstvos, and Municipal Councils were similarly federated into a national society. These bodies rendered invaluable service in auxiliary relief work, although continually hampered by a suspicious and jealous attitude on the part of the national government. The dynasty had been given a unique opportunity to retrieve its misdeeds and blunders by placing itself wholeheartedly at the head of a great popular movement. But unfortunately Czar Nicholas II, although well-meaning, was perversely narrow-minded and weak. Surrounded by reactionary nobles, priests, and bureaucrats, he "utilized the temporary heat of national altruism and patriotism in order to forge enduring iron links in the chain of social inequality and political absolutism."

The Russian invasion of East Prussia met with an overwhelming catastrophe in the battle of Tannenberg, but simultaneously Russian arms gained signal successes against the Austrians in Galicia. Reform in Poland was delayed while reactionary and ultranationalistic officials devoted themselves to energetic measures for Russifying conquered Galicia. During the winter of 1914–15, although the Russians held their own on the eastern front, they showed few signs of sweeping like a "tidal wave" on Berlin or Vienna, as optimistic Allied publicists hoped. At the opening of the Duma in February, 1915, Premier Goremykin expressed unwavering confidence in ultimate victory, and the majority of the legislature seemed to share his faith. Meanwhile, the Russian foreign minister, Sazonov, had taken diplomatic measures to insure the realization of Russia's great ambition, the acquisition of Constantinople. The Czar's government hailed with positive delight the opportunity afforded to declare war on Turkey (Oct. 31, 1914). On Nov. 14, 1914, the British Ambassador at Petrograd informed Sazonov that Russia might have Constantinople, and during the following March (1915) a secret arrangement was consummated with France and Great Britain whereby Russia was also to get the whole of Turkey in Europe except a district around Adrianople and Kirk-Kilisse; the Asiatic shores of the Bosporus; and about 80 miles of the Black Sea coast in Asia Minor, all in return for according the British and French like satisfactions in other regions. At that very moment an Anglo-French expeditionary force was engaged in trying to force the Dardanelles in response to a Russian plea for a relief of pressure on the Caucasus front, where the Turks had concentrated their main strength. Russia failed to cooperate with her Allies in that tremendous undertaking, so vital to her interests and so essential to Entente victory. And with what now appears to have been consummate folly, fathered by greed, the Russian cabinet definitely vetoed the plan to obtain Greek military aid in opening the Straits; the Greeks, so Petrograd feared, might preëmpt Constantinople. The débâcle which eventuated had a direct causal effect on Russia's subsequent collapse, since it deprived her of a line of communications which, if kept open, would have facilitated the shipment of supplies and munitions to her poorly armed legions. In a struggle of machinery and specialized technical equipment such as the War was proving, Russia was ill-prepared for battle; a land of primitive agriculturists, in a semifeudal society, geographically cut off from assistance, she lacked the requisite resources and industrial organization.

The year 1915 had opened rather brightly for Russia. To be sure, the government was experiencing great financial difficulties, due to the loss of revenue entailed by the abolition of the government monopoly of the sale of vodka and to the stupendous expenditures for military purposes, but France and Great Britain lent valuable assistance in sustaining Russian credit, and a large loan was floated in America. In the spring and summer of 1915, despite the intervention of Italy, the armies in the West being deadlocked, a gigantic Teutonic force was concentrated on the eastern front, and the Russians suffered a series of disastrous defeats. Russian generals, several of whom had conspicuous ability, were grievously handicapped by intolerable social and economic conditions. Russia's illiterate peasant armies, valorous in the extreme but woefully short of munitions and supplies, could not cope on equal terms with the disciplined troops of the Central Powers. Mere numbers availed nothing against superior and overwhelming machine-guns and howitzers. During May and June, General von Mackensen, with combined Austro-Hungarian and German armies, expelled the Russians from Galicia; immediately thereafter General Hindenburg, the erstwhile victor of Tannenberg, directed a mighty thrust at Russian Poland. By October, 1915, all of Poland, together with most of Lithuania and Courland, was in the hands of the enemy powers, and the military prestige of Russia was destroyed. Up to October, 1915, Russia had lost approximately 2,500,000 men: 500,000 dead,

1,000,000 wounded, and 1,000,000 taken prisoner,

The Meeting of the Duma. The reverses in the field had profound repercussions on political life. Patriots assailed the government for its criminal inefficiency and accused leading generals of incompetence. An early session of the Duma and the selection of a really representative national ministry were demanded. Premier Goremykin made some concessions to the critics. He superseded his unpopular Minister of the Interior, Makarov, by the more liberal Prince Cherbatov. On June 25, the scoundrelly Sukhomlinov resigned the war portfolio and was replaced by General Polianov. Other reactionaries were dismissed and more acceptable conservatives appointed to succeed them. These changes postponed the impending crisis, but the situation was serious in the extreme when the Duma reassembled on August 1. The Duma, while expressing fervent loyalty and patriotism, demanded that the government collaborate with the people in a more democratic spirit Goremykin promised fuller coöperation in the work of national defense and planned to create advisory boards including experts and delegates from the Zemstvos, Municipal Councils, the Duma, and the Council of the Empire, to assist the ministers of war, commerce, communications, and agriculture The Duma liberals, aroused by amazing revelations of treason and corruption in the government and army circles, demanded greater reforms. In late August and early September, 1915, under the leadership of the Constitutional Democrat, Milyukov, a bloc of liberal and moderate groups was constituted, embracing all elements in the Duma except the extreme reactionaries and nationalists on the Right and the extreme radical Social Democrats on the Left. The programme of the bloc involved: (1) the reconstruction of the ministry on a more representative basis; (2) the reconciliation of discontented nationalities and aggrieved social classes; (3) the reform of local administration; (4) punishment of delinquent commanders and officials; and (5) the vigorous prosecution of the war. Simultaneously (September 5), the Czar with a magnificent gesture assumed nominally supreme command of the army, and Grand Duke Nicholas was transferred to the Caucasus.

After the German drive had spent its vigor, reaction triumphed over reform. To the consternation and anger of the Liberals, an imperial decree unexpectedly prorogued the Duma (September 16). In October, Khovostov from the extreme Right in the Duma replaced Cherbatov as minister of the interior, with the avowed purpose of strengthening the machinery of "benevolent but firm authority." One ministerial change followed another during the autumn and winter, until on Feb. 1, 1916, "the very acme of reaction was reached with the retirement of Goremykin and the succession of Boris Stürmer, an ultraconservative and an oppressive landlord reputed to be pro-German in his personal sympathies"

The Sturmer Ministry. The opening days of the new administration were signalized by important Russian victories in Asia Minor, including the capitulation of the great Turkish stronghold of Erzerum (February 16). The Duma, reconvened on February 22, was honored for the first time by the personal attendance of the Czar. Nevertheless, relations with the ministry continued critical and controversial. Finance occasioned a sharp debate; an income tax was levied, and recourse was had to British, French, and American loans. Liberal groups denounced the government for its failure to establish a greater measure of political liberty and for its harsh treatment of Finns and Poles. There was also a disorderly debate on the continued persecution of the Jews. New changes in the ministry followed these attacks. Khovostov and Polianov resigned the interior and war portfolios respectively, and General Sukhomlinov, the ex-Minister of War, was imprisoned for treasonable negligence in conduct of his office Meanwhile Russia's military fortunes were appreciably reviving. During the winter of 1915–16 Russia's lines were reformed, her arsenals replenished, and her command reorganized. In the summer of 1916 she coöperated with her allies in a series of coördinated offensives. Under General Brussilov, the Russians inaugurated a vigorous drive along the Sereth River at the beginning of June. By the middle of August, the entire province of Bukovina had been conquered and some 350,000 men taken, together with enormous stores of equipment. Russia's sudden rise, "phoenix-like, from the disastrous fire and flame of the preceding autumn, reassured all the Allies." It contributed to Allied successes in the West, and it was the chief factor in encouraging Rumania to enter the War on the side of the Allies (August, 1916). Russia, however, consented with ill grace to Rumanian demands for future compensation and subsequently displayed short-sighted duplicity in neglecting to aid her southeastern neighbor and ally against the terrific Teutonic onslaught Meanwhile, the internal situation in Russia had grown truly alarming, for the recovery of the army from its defeats and demoralization in 1915 was not accompanied by a restoration of political confidence and stability at home The Czar and his advisers had learned no lesson. They persistently ignored the symptoms of economic distress palpably manifest throughout the empire and gave no consideration to widespread popular demands for political reform. Against the Stürmer ministry a mass of grievances speedily accumulated. The premier muzzled public opinion, forced the resignation of the able and patriotic Sazonov (August, 1916), appointed extreme reactionaries to office, prorogued the Duma from July 3 to November 14, promulgated obnoxious autocratic decrees, and endeavored to repress popular organizations (especially the All-Russian Union of Zemstvos, the Union of Municipalities, and the War Industries Committee), formed to promote popular cooperation with the government and to assist in the vigorous prosecution of the war. On October 4, Stürmer ordered all meetings of these organizations to be placed under police surveillance and entrusted the administration of the interior to Protopopov, the most zealous prosecutor of liberals in all Russia and a pro-German into the bargain.

The Trepov Ministry. These measures aroused a storm of protest and united all factions against the government. Shortly after the Duma met (November 14), Stürmer resigned, only to be succeeded by a reactionary of the same stamp, Alexander Trepov The Duma did not relax its criticism. In the midst of a stormy session during the closing days of 1916, Professor Milyukov, leader of the Constitutional Democrats, vehemently assailed the government, being supported by several other speakers who

made sensational disclosures concerning the almost traitorously inefficient prosecution of the war. The Duma, the Imperial Council, and the Council of Nobles, all passed resolutions excoriating the "dark forces" tending to paralyze the national organism and to create confusion in all departments of the government. "Autocracy of the Russian variety proved itself absolutely unfit to meet the supreme test of the Great War." Despite the alarming spread of popular disaffection during the winter of 1916–17, the government adhered to its traditional methods of secrecy, suspicion, repression, and intrigue. The Czar was hopelessly dominated by his consort, Czarina Alexandra Feodorovna, and she in turn was under the hypnotic influence of fools, hypocrites, and charlatans, especially the notorious Gregory Rasputin. "Rasputin (meaning 'dirty dog'), a curious compound of shrewd peasant, avaricious politician, erotic maniac, and religious fanatic, acted as official 'medicine man' to a superstitious court and gave tone and character to the blind, perverse autocracy." Friend of Goremykin, Suhkomlinov, Stürmer, and Protopopov, with whom he coöperated to frustrate nascent liberalism and constitutionalism, he exercised such a baleful influence on the course of events that his assassination at the end of December, 1916, caused much rejoicing. It was a grim portent of immanent revolution. The situation at the opening of 1917 was extremely tense and abnormal. The armies at the front sullenly maintained their positions but were war-weary and distrustful of their leaders. "The factory workers in the towns were deeply affected by internationalistic and socialistic ideas, while the peasants were groaning under the heavy toll of conscription and the economic demands arising from a war which they had ceased to understand. Among the intellectuals there was a widespread feeling of uneasiness as regards the coming catastrophe. . . . But the prevailing sentiment was despair as to any improvement in the reactionary government."

The Golitzin Ministry On Jan. 9, 1917, Prince N. Golitzin, "a typical bureaucrat with compressed brains and elastic conscience," replaced General Trepov as premier. Other reactionary appointments followed, and the reopening of the Duma was deferred from January 25 to February 27. The government was openly charged with aiming "to provoke a futile rebellion, to suppress the rebellion by force, to quell by terrorism an agitation for reform, and to entrench Russian autocracy anew in power for another century." On February 25, a secret arrangement was concluded with France whereby Russia was to get a free hand in drawing her western frontiers, i.e. around Poland, in return for the granting of a similar freedom to France along the Rhine. This devious diplomacy was nullified by the subsequent course of events. A grave shortage of food in Petrograd and other cities was accentuated by the mismanagement and corruption of the government. The Duma reconvened on February 27, amid overawing police guards. Workmen to the number of 100,000 in Petrograd and 25,000 in Moscow went on strike as a political manifestation on behalf of the Social Democrats. The food crisis became acute. Bread riots occurred. On Mar. 11, 1917, the Czar's government ordered the Duma and the Council of the Empire to dissolve and the workmen to return to their jobs. The workers refused to obey, and the Duma declined to disband, declaring that it was now the sole constitutional authority in Russia. The Revolution was at hand.

The Revolution and the Provisional Government. After several days of critical uncertainty, the Petrograd garrison was won over, the organs of autocracy ceased to function, and the Revolution spread with lightning speed to the armies in the field and to distant provinces. The forced abdication of the Czar (March 15) in favor of his brother the Grand Duke Michael, and Michael's refusal to accept the crown unless it were proffered by the will of the people, ended the three-century rule of the Romanovs. In Petrograd authority was divided between the Duma and a newly constituted Soviet (Council) of Workingmen's and Soldiers' Delegates. By an agreement between them, a thoroughly respectable bourgeois provisional government recruited from the Duma and responsible to it was established under the premiership of Prince George Lvov, a liberal landlord, president of the Union of Zemstvos and member of the Constitutional Democratic party. His ministry embraced seven other members of his party, including Milyukov as foreign minister, three Octobrists, including Guchkov, who held the war portfolio, and one Social Revolutionary, Alexander Kerensky, as Minister of Justice.

The provisional government was speedily recognized by foreign countries. With equal celerity, the policies of the discredited autocracy were reversed. Finland's constitution was restored; the Poles were promised unity and self-determination; and the Jews received a sweeping bestowal of equal rights. Thousands of political offenders were released from prison or recalled from exile. Freedom of speech, of association, of the press, and of religion were proclaimed, and it was announced that a National Constituent Assembly would shortly be designated by universal suffrage to frame a permanent popular constitution for Russia. The new ministry advocated a thoroughly democratic régime for revolutionized Russia, but "unlike the democracies of western Europe, the Russian revolutionary movement would have to base itself less on an electorate of educated bourgeois and prosperous independent farmers than on a mass of illiterate, poverty-stricken peasants, and on noisy groups of ill-disciplined urban workers," for Russia was politically, economically, and socially the most backward country in Europe. Moreover, the great mass of peasants and proletarians were not satisfied with promises of political democracy and individual liberty; they desired a far-reaching social and economic transformation. More representative of the bulk of the Russian people than the bourgeois provisional government were the extra-legal Soviets of Workmen's, Soldiers', and Peasants' Deputies, which, modeled on the initial Petrograd organization, were constituted throughout the country and in the army. The first National Congress of Soviets held at Moscow (April, 1917) demanded fundamental agrarian reform, the participation of workmen in the management of industry, the democratization of the army, and the continuance of belligerency only on the basis of a peace programme involving "no annexations and no indemnities."

There was a wide gulf between these aims of the Soviets, which were dominated in the rural regions by Social Revolutionaries and in the

towns by the Menshevist faction of the Social Democrats, and those of the middle-class government of Lvov. The latter desired to subordinate internal reforms in Russia to the vigorous prosecution of the War. Milyukov, as minister of foreign affairs, adhered to the diplomatic traditions of the old régime, favoring the firm maintenance of national prestige, cordial and consistent coöperation with the Allies, and the complete realization of imperialist aims as embodied in the secret treaties The demobilization of the army, the immense wave of war-weariness among the mass of the people and the hostile attitude of the Soviets, forced the resignation of Milyukov, Guchkov, and other moderately conservative ministers, and on May 16, 1917, the Ministry was reconstructed along more radical lines, Kerensky as Minister of War becoming the dominant figure, overshadowing Premier Lvov. In the ministry were seven Constitutional Democrats, two Octobrists, three Social Revolutionaries, and three Menshevik Social Democrats.

The Kerensky Government. Kerensky made strenuous efforts to terminate the War successfully, while simultaneously endeavoring to assure both political democracy and social reform. But although extremely eloquent and well-intentioned, the new leader lacked statesmanlike prevision, clearness of purpose, and strength of will. "After attaining to a unique position at the head of revolutionary Russia, Kerensky entangled himself in a net of contradictory measures, of ill-judged assertions of authority and of weak-minded compromises and renunciations." His ministry encountered the opposition of Constitutional Democrats who feared anarchy, of the Bolsheviists who were growing more influential in the Soviets, and of German emissaries fostering separatism among the subject nationalities and pacifism among the soldiers, workmen, and peasants. He was unable to secure a repudiation by the Allies of the obnoxious secret treaties or a restatement of war-aims on the basis of "no annexations and no indemnities" Under the circumstances it was impossible to infuse patriotic enthusiasm into the Soviets, and the disintegration of discipline in the army led to disastrous defeat during the attempted Brussilov offensive of July, 1917. All the gains of 1916 were obliterated in one crowning catastrophe, and the Germans extended their lines in the Baltic provinces. The Austrians recovered all of Galicia.

Even more alarming than these defeats at the front was the continued growth of internal chaos. Although numerically speaking, it was a mere insignificant minority of the Russian people, the extreme faction of Bolshevists which had consistently opposed the War since its very outbreak, began in the spring of 1917 to acquire immense prestige among the war-weary masses who were more eager for the social millennium than for military victory. The Bolsheviks adhered to their principles in frankly repudiating political democracy and refusing to coöperate with the bourgeoisie or even with the Social Revolutionaries and Mensheviks in the hour of supreme national crisis. This subversive propaganda was facilitated by the return of a long-exiled leader, Nikolai Lenine (the pseudonym of Vladimir Ulianov), a man of noble extraction who had become a "doctrinaire socialist of the dogmatic type" with an international reputation. Lenine's chief accomplice in his formidable assaults on Russian society and the provisional government was a fanatical ex-Menshevik, Leon Trotsky (a pseudonym for Bronstein), a man of middle-class Jewish origin, who had likewise been a political exile and who returned to Russia in May, 1917. The Bolsheviks vociferously agitated for peace, outlined a temptingly utopian programme of immediate social reforms including expropriation of the landed nobility and industrial self-government, and made their slogan "All power to the Soviets." In June, at the All Russian Congress of Soviets assembled in Petrograd under the presidency of the Menshevist leader Tcheidze, Lenine pronounced a furious indictment of the provisional government and of Kerensky. His attack was unavailing, however, and he was overruled by the moderates. Following the collapse of the Russian offensive in July, Prince Lvov and the other Constitutional Democrats in the ministry resigned (July 17). A Bolshevist uprising was repressed by Kerensky with the aid of the Menshevist Petrograd Soviet, Lenine fleeing to Finland where he remained until October. On July 20, Kerensky became head of the provisional government. He still hoped to save Russia, but the odds were against him. An extraordinary conference representing various parties, the Zemstvos and municipalities, universities, the army, factory workmen, and peasant communities, which met in Moscow late in August, revealed a state of complete paralysis and confusion among the leaders of the country. In September, Kornilov, who had succeeded Brussilov as generalissimo, attempted to assume a military dictatorship, after concerting plans to that effect with Kerensky, but the latter turned against him and took control of the army. This affair caused a recrudescence of revolutionary zeal and a violent rush to the Left. Meanwhile anarchy increased in everyday life. The peasants were seizing the large estates, dividing the spoils, and executing summary justice on those who had long oppressed them; urban workmen were dispossessing factory-owners. The Soviets called a Democratic Conference in Petrograd on September 27, to represent peasants and proletarians but no bourgeois elements. All proposals for a new and more capable coalition government failed.

The Bolshevist Revolution. The weakness of the government was the strength of the Bolsheviists. Gradually, they supplanted the Mensheviists in control of urban Soviets, and by promising speedy agrarian reforms, i.e. confiscation of land, they weaned the peasants away from the Social Revolutionaries and Kerensky. Trotsky, imprisoned after the July fiasco, was subsequently released, only to succeed the Menshevist president of the Petrograd Soviet and to renew his subversive activities by organizing Red Guards subservient to Bolshevist wishes. During October Kerensky made one last effort to bolster up his government by establishing a Council of the Republic with a membership drawn from all the political parties, principal associations, and institutions. It was of no use; the day of reckoning had come. The provisional government had failed to fulfill popular aspirations or to overcome the force of opposition. "The time seemed ripe for a Bolshevist revolution and for the establishment of a dictatorship of the proletariat." By extravagant promises of peace and an earthly paradise, by irresponsible attacks on the much-harassed government, and by

the use of traditional political methods of intimidation and intrigue, the Bolshevists managed to control a large majority of the delegates newly elected to the Congress of Soviets. Having formed a Military Revolutionary Committee and assured themselves of the support or benevolent neutrality of the Petrograd garrison, the Bolshevists utilized their Red Guards to execute a coup d'état (Nov. 6–7, 1917). Kerensky had provided no adequate defense, and the conflict was brief. The members of the provisional government were taken into custody, Kerensky alone evading capture. On November 8, the change was formally recognized by the All-Russian Congress of Soviets, which immediately sanctioned the establishment of a Council of People's Commissars with Lenine as premier and Trotsky as Commissar for Foreign Affairs.

In full accordance with the anticapitalist tenets of their faith, with the anti-imperialist pronouncements of the Zimmerwald manifesto of 1915, and with their promises to the benighted and war-weary masses, the Bolshevists resolved to conclude peace with the Central Empires at any price. Proposals to the Allied governments for the immediate conclusion of an armistice and the restatement of war-aims on the "no annexations, no indemnities" basis eliciting no answer, the Bolsheviks enraged the Entente rulers by publishing the "secret treaties." An armistice was concluded with Germany, Austria, Turkey, and Bulgaria at Brest-Litovsk on Dec. 17, 1917. Here on December 22 despite Allied protests to Russia against concluding a separate peace, a formal Peace Conference was inaugurated. The idealistic peace proposals advanced by the Bolshevists were accepted by the Germans "in principle" but entirely vitiated in practice. Early in January the Conference reached an impasse owing to extreme Teutonic demands and insistent Bolshevist propagandizing. On February 10, the Soviet government announced that it could not conclude peace but would not renew the war. The Central Powers, however, terminated this solemn farce by reopening hostilities. Trotsky gave up the foreign office for the war portfolio and was succeeded by Tchitcherin, who coöperated with Lenine in bringing about a renewal of negotiations. An exceedingly drastic set of peace terms was finally incorporated in the Treaty of Brest-Litovsk, signed on Mar. 3, 1918. This convention registered a striking devolution of the age-long process of Russian European aggrandizement, for the huge and heterogeneous empire was diminished and transformed into an essentially national state of an area comparable with that existent before Peter the Great. By a curious coincidence the same period witnessed the retransfer of the national capital from Petrograd (Peter's town) to Moscow. The Bolshevists were obliged to relinquish Finland, Poland, Esthonia, Livonia, Courland, Lithuania, Ukrainia, Bessarabia, and part of Transcaucasia, which, although not annexed to the Central Powers, were dominated and economically exploited by them. Russia thereby lost 26 per cent of her population, 27 per cent of her arable land, 32 per cent of her average crops, 26 per cent of her railway system, 33 per cent of her manufacturing industries, 73 per cent of her total iron production, and 75 per cent of her coal fields.

Bolshevist Domestic Policy. In the meantime the Bolshevists were consolidating their power in Russia. Internal opposition was repressed with an iron hand. By means of revolutionary tribunals and summary proceedings they inaugurated a régime of systematic terrorism to extirpate reactionaries, hostile liberals, and lukewarm moderate revolutionaries. Among the tens of thousands who perished in the years 1918–19 were ex-Czar Nicholas II and his family, who were deliberately killed at Ekaterinburg on July 16, 1918. The methods of Bolshevism, the much-vaunted dictatorship of the proletariat, thus savored of ruthless czarism at its worst. Indeed, though the Bolshevists expected that the state, which they regarded as purely a "capitalist organ," the tool of a dominant class in society, would be rendered quite superfluous with the ultimate realization of communism, nevertheless they believed that during the transitional period of "dictatorship" the proletariat would require an instrumentality of control fully as coercive as the capitalistic state. It was not political democracy, it was force and fraud which these would-be communists utilized to establish and perpetuate their rule. The National Constituent Assembly, finally elected by equal, direct, universal, and secret suffrage in November, 1917, embraced a considerable majority of Social Revolutionaries who were anti-Bolshevist in sympathy. The Council of People's Commissars, not finding this organ of democracy sufficiently subservient, postponed its meeting till January, 1918, and finally dissolved it altogether. The All-Russian Congress of Soviets, purged of militant anti-Bolshevists, automatically became the supreme repository of legislative power.

Individual liberties, political democracy, and the prosecution of the War were all shelved while the new Bolshevist government embarked on a radical course of social and economic experimentation and revolution A series of decrees issued in November, 1917, and subsequently, pronounced the doom of the capitalistic régime All special privileges were abolished, and obligatory labor was enjoined on all citizens. Private ownership of land was abolished without compensation, and all real estate was nationalized, the peasants being permitted to occupy such land as they actually cultivated. Mines, forests, and railways were appropriated by the state, and factories were transferred to the management and operation of workingmen. The national debt was repudiated, private banking resources confiscated, and foreign trade made a government monopoly. "The Russian Orthodox Church was shorn of its wealth, deprived of state support, and reduced to the position of a voluntary, unprivileged, and self-supporting society. Private schools were suppressed, and considerable attention was given to the development of a nation-wide system of public schools which should be owned and directed by the state and in which loyalty to Bolshevist principles should be inculcated. Altogether the Bolshevist régime in Russia effected a vast holocaust of traditional forms and usages, of ancient privileges and institutions; it ended aristocracy as well as Czarist autocracy; it transformed both church and state; it substituted socialist for individualist concepts of property."

The substance of these Bolshevist principles, precepts, and practices was enshrined in the constitution of the Russian Socialist Federated Soviet Republic, adopted in July, 1918, by the fifth

All-Russian Congress of Soviets. By this document all central and local authority was formally vested in Soviets of workers', soldiers', and peasants' delegates. For Soviet elections all citizens and resident aliens over 18 years of age, male and female, who earned their living by "productive labor," and all revolutionary soldiers and sailors were enfranchised, but the right to vote was denied to all capitalistic producers, landlords, private merchants, clergymen, and certain other classes. The centre and source of all power was to be the All-Russian Congress of Soviets, consisting of representatives from the Soviets on the basis of one delegate for every 25,000 electors, and from provincial congresses of Soviets on the basis of one delegate for every 125,000 inhabitants—the franchise being thus heavily weighted in favor of the urban workers, the main supporters of Bolshevism, who were represented both in their own city soviets and in the provincial congresses and therefore enjoyed double electoral powers. The All-Russian Congress thus constituted was empowered to elect an All-Russian Central Executive Committee of some 200 and later 300 members to serve as the controlling executive, legislative, and administrative organ while the Congress itself was not in session. The Central Committee in turn was to designate a supreme central administrative cabinet, the Council of People's Commissars, composed of 18 members responsible to the Central Committee and through it to the Congress and subject to recall at any time. Individually these commissars were to preside over various departments such as those of foreign affairs, war, interior, justice, labor, etc.; and collectively they were responsible for the general conduct of affairs and the execution of Soviet policies. The commissars who exercised the real authority were thus about five steps removed from direct popular election and control, if such a thing might be said to exist in a country where the Bolshevists (Communists), a mere minority party of some 600,000 highly disciplined members, controlled the machinery of government and the organs of public opinion The drastic way in which they had fulfilled popular longings for peace, for land, and for proletarian privileges assured them a modicum of popular support; and this, taken in conjunction with their arbitrary use of force, kept them in power.

Despite perennial and perfervid prophecies to the contrary, the Boshevist government proved unexpectedly stable; it survived domestic insurrections, counterrevolutionary movements, and foreign intervention during the troubled years from 1918 to 1921; by 1924 it had attained a not inconsiderable measure of domestic support and foreign recognition. But its leaders were unable to achieve either of their two major objectives: (1) the successful and complete communization of Russian society; (2) the precipitation and consummation of a world-wide proletarian revolution.

Aside from and in addition to any inherent fallacies in Bolshevist doctrines (see BOLSHEVISM; COMMUNISM; SOCIALISM) and obvious technical limitations of Bolshevist leadership, there were many virtually insuperable obstacles to the achievement of communistic reforms in Russia. These embraced such factors as: (1) the colossal and almost universal ignorance of the lower classes, on whose intelligent and voluntary coöperation the success of such ventures largely depended; (2) the "persistent and deep-seated hostility of dispossessed property-owners in Russia and of capitalists in foreign countries"; and (3) the agricultural, industrial, and commercial demoralization of Russian society resulting from the War and already manifest when the Bolshevists seized power in November, 1917. The next four years saw confusion worse confounded.

Agrarian Situation. The widespread prevalence of agrarian unrest and the peasants' passion for land had been potent factors in the subversion of the old régime. Approximately 85 per cent of the population of Russia was classed as rural, and the problem of adjusting the theories of the revolution to meet the interests of this great class was a source of much concern to the Soviet authorities. The land expropriation and redistribution which accompanied the Bolshevist coup d'état augmented the total land holdings of the peasantry from 70 per cent of the total cultivated acreage to 96 per cent in European Russia proper and from 55 per cent to 96 per cent in the Ukraine. In this process, not only were virtually all the large landed estates wiped out, but larger peasant holdings disappeared as well, so that eventually small farms of less than 22 acres comprised 90 per cent of the total. The basic principle of the law of February, 1918, was the abolition of all private ownership of soil; all land was to be distributed on the basis of an "equalized land tenure" to individuals for cultivation. The individual holder became virtually an employee of the state; the produce, after a deduction of enough to meet his current requirements, became the property of the state. The great mass of peasants failed entirely to comprehend that this law confiscated their land as well as that of the erstwhile privileged classes. Conflicts between peasants and former urban workers and others who desired to benefit by the new policy led to a restatement of the land policy in a new law (February, 1919) which while not prohibiting individual farmers declared definitely in favor of "large Soviet estates, rural communes, group agriculture, and all other forms of collective use of land," and stated that "all forms of individual use of the land" were "merely temporary and doomed to disappearance."

In the years following the land-socialization policy there was a marked decrease in the area under cultivation. This and other circumstances, notably crop failures, forced the government to take two highly important steps in the reversal of that policy. First, in the spring of 1921, the principle that the entire produce of the farmer belonged to the state was virtually abandoned. All peasants who paid a fixed tax in kind were given the right to dispose of any surplus as they pleased In the second place, in the spring of 1921 the fundamental law of land possession was completely revised. While it reiterated the basic principle that "the land belongs to the state" and repeated the prohibition against the purchase, sale, and mortgage of land, it completely abandoned the idea that "all forms of individual use of the land should be regarded as merely temporary and doomed to disappearance." The peasants were given not the technical ownership but the actual possession of the land. The old village communities were allowed to continue their practice of permanent group possession with periodical repartition to members for actual use, but at the

same time the individual peasant family was to be permitted to break away from these communities and to acquire direct possession, perpetual and hereditary. The new law was thus almost identical in principle with Stolypin's agrarian measures of 1907 and 1910. In short, it was a distinct recognition of the individualistic tendencies of the mass of the peasants, coupled with a continued attempt to guard against any return to economic inequality in land possession. A new system of graduated land taxation helped toward the same end of maintaining social equilibrium. Agriculture constituted the one line of production in Russia where human enterprise was practically unaffected by the communist régime from the start, and where, given more freedom and opportunity to dispose of their output and to export surplus grain, the peasantry might conceivably attain greater prosperity than ever before, thus potentially raising the general level of national prosperity. By 1923 Russian agricultural production aggregated 75 per cent of the pre-war average.

Industrial Situation. Industrially, Russia in 1917 had been severely strained by the War. The breakdown of the railways and shipping of the transportation system not only interrupted trade and deprived the peasants of implements and supplies but prevented the shipping of foodstuffs to the industrial cities. Here, the expropriation of factory owners and the prohibition of trade completely dislocated the normal economic relations of society, for the workmen proved too ignorant to operate the great industries without technical assistance. "Industrial production dropped to the lowest ebb, due to the system of management by workmen's committees, lack of incentive for human endeavor, the scheme of universal state maintenance of the working classes, equalization of all working personnel, irrespective of the degree of responsibility or nature of work performed." Various measures for stimulating production by all kinds of premiums and penalties were utilized and discarded in turn. The dwindling of available reserves of materials and productive equipment to serious proportions and the menacing diminution of agricultural acreage noted above threatened the proletariat with starvation, and menacing strikes occurred in Petrograd, Moscow, and other cities during the winter of 1920–21. The Soviet government was compelled to modify the application of its communistic policies. Technical experts and managers were restored to their positions at relatively high salaries. Trading in commodities, at first prohibited, then winked at, became openly tolerated and was finally legalized in May, 1921.

The "New Economic Policy." On April 7 of the same year the original plan of complete state confiscation of all industrial products was modified to permit industrial enterprises to allocate a certain portion of their output to workmen as wages and premiums, the workmen in turn being free to dispose of these products in the open market. This was the beginning of the so-called "New Economic Policy" (N.E.P.), characterized by Lenine as a "strategic retreat," which marked the gradual abandonment of communism through the successive phases of collectivism and state socialism to a system of quasi state capitalism. Under the new system nearly all the basic industries were organized into self-governing trusts and syndicates, accountable to the state for only part of their current profits. Private initiative was admitted by leases of less essential enterprises and by concessions and participation in mixed companies, in which, however, the controlling interest was to be held by the state. The principal banks continued under government control, and foreign trade remained a government monopoly. Labor armies and compulsory labor in general were abolished, as well as all forms of rationing. The ordinary system of employment and wage-earning was restored, with the interference of trade union and factory committees in the management of works reduced to a minimum. Two contrary developments manifested themselves after the inception of the new economic policy: (1) the continued process of exhausting the means of production; and (2) the improvement in the organization of industrial processes and of exchange. By 1922 Russian industry reached 22 per cent of pre-war production, a measurable increase over previous years; in 1923 the figure had increased to 35 per cent, and in 1924 to 45 per cent.

The new departure in internal policy, coupled with the cessation of foreign war (see below), seemed to prefigure a brighter future for Russia. The disastrous effects of the famine of 1921 were dissipated in succeeding years by more favorable crops. Industry seemed to be reviving, and trade was resumed with various foreign countries. But the new order of things, frankly advocated by Lenine and the more moderate associates, was vigorously assailed by the Communists of the extreme left wing, and there was considerable dissension in party councils. The personality, intellect, and will-power of Lenine overbore all opposition, and even during his prolonged illness during 1922 and 1923 his policies prevailed. The death of Lenine on Jan. 21, 1924, was followed by a pronounced change in governmental policy. His successor, Rykov, inclined in the direction of extreme communism, and during the spring of 1924 steps were taken toward abandonment of the compromise with capitalism which had been made during 1921 and 1922 and the reintroduction of pure communism. This swing back to the extreme left occasioned no small confusion in the ranks of the Communist party. Even before Lenine's death, his lieutenant Trotsky had broken lances with the extremists and fallen under censure; and after the overshadowing figure of Lenine had passed away, factional strife became exceedingly violent. The years from 1922 to 1924 were also marked by bitter religious controversies, over religious teaching in the schools, the confiscation of church property, the attempts of the government to encourage the "Living Church" movement, and the trials and executions of various prominent prelates, both Russian Orthodox and Roman Catholic, on charges of treason. There was a marked tendency, it may be remarked in this connection, toward the abandonment of Christianity on the part of such Bolshevists as were not Jews, and toward the substitution of somewhat bizarre Communist ceremonies for the Christian ritual of baptism and death; marriage became a civil contract, readily dissolved by mutual consent, but not more than three divorces were permitted to the same person in any one year.

Foreign Policy. No less preoccupying than domestic affairs were the foreign relations of Soviet Russia. The Treaty of Brest-Litovsk,

far from ridding Russia of the Teutonic "peril," proved a prelude to systematic and sustained intervention in her internal affairs during 1918. Such Russian economic resources as were susceptible to German seizure were ruthlessly exploited to bolster up Germany's war-weakened military and economic machinery then making its supreme effort on the western front. Separatist nationalities in Finland, Esthonia, Latvia, Lithuania, Poland, and the Ukraine emancipated from Russian control by the Treaty of Brest-Litovsk were encouraged to set up anti-Bolshevist governments under German surveillance and semisuzerainty. In order to prevent too active Bolshevist propaganda in Central Europe, financial and military support was extended to Russian counterrevolutionary leaders. Only the complete collapse of the Central European coalition in October and November, 1918, saved Russia from even more far-reaching Teutonic domination.

The defection of Russia from the Allied cause had proved a staggering blow to the Entente, and the course of the Bolshevist leaders was naturally resented by the governments of France, Great Britain, Italy, Japan, and the United States. The revelation of the secret treaties, the negotiation of a separate peace, the repudiation of Russia's immense foreign indebtedness, the inauguration of a communistic régime within Russsia with its attendant nationalization of property and inevitable reign of terror, all taken in conjunction with the apprehension aroused by the openly avowed Bolshevist ambition to effect a world-wide social revolution, infuriated Allied public opinion against Russia. In March, 1918, Allied intervention in Russia began in earnest, ostensibly to revive the eastern military front and to prevent German recuperation at Russian expense, but also with the ulterior purpose of setting limits to the subversive activities of the Bolshevists and of striking anticapitalist communism in its very stronghold A rigorous economic blockade was established around the erstwhile Allied country, and expeditionary forces were landed at Murmansk in northern European Russia and at Vladivostok on the distant Pacific coast Truly the year 1918 was a period of terror and turmoil for all Russians. Even with the triumph of Allied arms in the War, intervention in Russia did not cease. "The Allies occupied northern Russia, the Crimea, and most of Siberia; members of the dissolved National Constituent Assembly, with a following of Social Revolutionaries, Constitutional Democrats and some reactionaries, set up at Omsk an anti-Bolshevist government which claimed to be the legal successor to Kerensky's provisional government; and certain reactionary Russian army officers such as Generals Denikin and Wrangel in southern Russia, or General Yudenitch, in the Baltic area, rallied Ukrainians, Cossacks, and adventurers to their standards, and with Allied support, undertook military campaigns against the Bolshevists."

In the spring of 1919 the Paris Peace Conference, profoundly disturbed by the spread of Bolshevism and its seeming menace to western society, endeavored to find some solution of the Russian imbroglio, but no settlement could be attained (see PEACE CONFERENCE AND TREATIES). Following the breakdown of these negotiations, the Allied governments reverted to the policy of supporting the various counterrevolutionary factions which in conjunction with the Allied expeditionary forces hemmed in and harassed Soviet Russia from all sides. Chaos reigned in eastern Europe throughout 1919, but in the course of time the Bolshevist government managed both to ward off foreign intervention and to suppress domestic revolts. The counterrevolutionists quarreled among themselves; the Russian proletariat and peasantry feared the triumph of reactionary royalism and the undoing of 'hard-won social and economic reforms; the spirit of nationalism impelled large numbers of non-Bolshevik Russians to coöperate in resisting foreign aggression; and finally the Allied governments had far too divergent interests and were far too exhausted by the long-continued strain of war to be able or willing to unite in a vigorous policy of coercion The Allied expeditionary forces were withdrawn from northern Russia in the autumn of 1919 and, in the spring of 1920, from Siberia, except Vladivostok, which remained temporarily under Japanese control. The various border states, Poland, Finland, Lithuania, Latvia, and Esthonia, were still encouraged to wage incessant warfare with Russia and were utilized from time to time as bases for fomenting and launching additional counterrevolutionary movements But with the withdrawal of active Allied military opposition the Bolshevist armies were enabled to deal more effectively with these lesser opponents. Yudenitch was driven out of the Baltic area; Denikin was expelled from southern Russia and forced to take refuge in Constantinople; Admiral Kolchak, temporarily victorious in extending his anti-Bolshevist dictatorship from Siberia into eastern European Russia during 1919, sustained serious reverses in battle, was captured by the Bolshevists, and was executed in February, 1920.

The French, however, continued throughout 1920 to make trouble for Russia and incited the Poles to wage aggressive war (see POLAND) with the aid of the Ukrainians, and aided and abetted the counterrevolutionist General Wrangel, Denikin's successor in southern Russia It was of no avail. On Oct. 1, 1919, Esthonia, Latvia, Lithuania, and Finland had united in proposing the negotiation of peace with Russia, and during the next year treaties were made between these states and the Bolshevist government. On Feb 2, 1920, Russia and Esthonia signed the Treaty of Dorpat providing for Esthonian independence and for reciprocal commercial advantages. By the Treaty of Moscow, July 12, 1920, the independence of Lithuania was recognized. War with Latvia was terminated by the Treaty of Riga, Aug. 1, 1920, by which Russia acknowledged the independence of Latvia and her sovereignty over Livonia, Courland, and Latgallia. Finland, long oppressed by the Czars, signed a peace at Dorpat on Oct. 24, 1920, by which her independence was confirmed, boundaries adjusted to include the district of Petchenga in the north, and portions of Eastern Karelia assigned to Russia. Russia also endeavored to come to terms with the Poles, but it was not until after a series of defeats and victories on both sides resulted in a stalemate an' the Treaty of Riga (Oct. 12, 1920, confirmed in final form, Mar. 18, 1921) that a settlement was finally achieved, stipulating Polish independence and the rectification of the eastern boundary of Poland (q.v.). Meanwhile the Bolshevists had successfully evicted General Wrangel from the Crimea and reconquered the

Ukraine (q.v.) which was once more attached to Great Russia by a treaty signed Dec. 28, 1920, consolidating the administration of economic and military affairs in such fashion as to leave the Soviet government of the Ukraine with the merest shreds of independence in foreign affairs, agriculture, education, and justice. Other border peoples, also, which had temporarily broken away, were regained by the Moscow commissars, who interpreted their dogma of self-determination in such fashion as to permit armed assistance to Red factions in neighboring states. In the Caucasian republics of Azerbaijan and Armenia (q v), Red troops helped to establish Soviet governments late in the year 1920, and in the following year Georgia (q v.) was sovietized and united with its two neighbors into a Caucasian federation under Moscow's protection. In Central Asia, Russian Turkestan was brought under firm control, and the Khanates of Khiva and Bokhara were transformed into Soviet republics despite the efforts of a brilliant Turk, Enver Pasha, to include them in a fantastic Pan-Turanian state (see PAN-TURANIANISM). Most of Siberia (q.v.), after the fall of Kolchak, was reincorporated into Soviet Russia, and the short-lived Far Eastern Republic, in the eastern extremity of Siberia, returned to the fold in 1922. The process of reintegration culminated in the signature of a treaty, Dec. 30, 1922, providing for the virtual federation of Soviet Russia, Soviet Ukraine, the Soviet republics of the Caucasus, and the White Russian Soviet Republic. On the basis of this treaty a new constitution was promulgated in 1923, establishing the "Alliance" or "Union of Socialist Soviet Republics." (See *Government*)

The liquidation of Russian imperialistic interests in the Near, Middle, and Far East was simultaneously being consummated. At the outset the Bolshevist doctrinaires had eschewed imperialism as a phase of the capitalism they sought to destroy, and true to the tenets of their creed, they had renounced the concessions and privileges acquired by prerevolutionary Russian governments in Turkey, Persia, Manchuria, and Mongolia. This anti-imperialist policy, at first manifested chiefly in negative form, soon assumed the positive aspect of a vigorous and widespread attempt to arouse the Asiatic races against Anglo-French domination and "exploitation." Afghanistan (q.v.) was incited by Bolshevist propaganda and encouraged by a Russian alliance to make war on the British Empire and to emancipate itself from British tutelage. With the Nationalist government of Turkey (q.v), the Moscow anti-imperialists likewise negotiated an alliance against European imperialism, but in this case the interests of the Allies were not sufficiently harmonious to make the treaty an effective force; the divergence of aims was seen most clearly at the Lausanne Conference (see PEACE CONFERENCE AND TREATIES), when the Turks showed themselves willing to compromise with Western Europe regarding the freedom of the Straits, while the Russians, anxious to exclude British and French warships from the Black Sea, held out for the absolute closure of the Straits to vessels of war. With China (q.v.) the Russian government after long negotiations concluded a treaty concerning railway interests in Manchuria and other disputed matters. The value of such diplomatic gestures as means of emphasizing Russia's self-appointed rôle of antagonist to European imperialism was enhanced by the propagandist activities of the Third International, supposedly a federation of Communist parties of all countries, but actually a propagandist organization, officered by leading members of the Russian government, dominated by the Russsian Communist party, and adhered to by only an insignificant minority of Socialists outside Russia. This organization directed its inflammatory agitation not only toward the subject peoples of Asia, but also toward the "capitalistic" nations of the West. The latter phase of its activity was particularly offensive to the United States government, the former to Great Britain.

The vigor shown by the Bolshevik government in suppressing counterrevolutionary movements and in reintegrating at least part of the old Russian Empire wrought a radical change in the attitude of the western powers The Allied blockade had failed to crush Russia. Post-war Europe needed commerce, and the British in particular were manifesting serious concern about the necessity of restoring normal economic life in Central and Eastern Europe to provide sources of food and raw materials and markets for British manufactured goods. They were also anxious to diminish or eliminate causes of friction with the Bolshevists so as to prevent trouble in Persia, Afghanistan, and India. These realistic considerations did not operate with equal force in the case of France, Japan, and the United States. The French, mindful of the 26,000,000,000-franc debt which the Bolshevists had repudiated, steadfastly refused to countenance any recognition of Soviet Russia. The United States firmly refused to recognize the Soviet government as representing the Russian popular will. Japan, despite four amicable secret conventions negotiated with Russia in 1906, 1910, 1912, and 1916, sought to profit by the temporary eclipse of her neighbor to enhance her interests in Siberia. On Jan. 16, 1920, the Supreme Council at Paris announced the lifting of the blockade around Russia and the prospective reëstablishment of trade relations, although Allied statesmen were at one in emphatically repudiating any desire or intention of recognizing the Bolshevist dictatorship During the remainder of 1920 the British, despite French opposition and the complications resulting from the Russo-Polish War, carried on negotiations for a trade agreement Questions of propaganda and of Soviet policy in Asia were also subjects of acrimonious correspondence. (See PERSIA; AFGHANISTAN; TURKESTAN; etc.) Finally, on Mar. 16, 1920, a trade agreement was signed, involving de facto recognition of Russia, the removal of all hindrances to a resumption of economic relations, the mutual abandonment of propaganda against the institutions of the respective signatories, etc. On this agreement as a prototype were modeled numerous agreements with other countries from 1921 to 1924. Germany signed an agreement on May 6, 1921; Norway, Sept 2, 1921; Austria, Dec. 7, 1921; Sweden, Mar. 9, 1922 (failed of ratification); Italy, May 29, 1922 (also failed of ratification); Czecho-Slovakia, June 5, 1922; and Denmark, Apr. 24, 1923.

The problem of Russia proved the storm centre at the important Genoa Conference (Apr. 10–May 14, 1922). Russia desired complete recognition and an Allied loan, but the French continued to insist that Russia should respect the rights of private property and recognize her

past debts. The sole tangible result of the conference was the signing of the Russo-German Treaty of Rapallo, providing for mutual cancellation of debts and war claims, which still further infuriated the French. The year following Genoa saw little headway made in the reacceptance of Russia into the family of nations, but late in 1923 and early in 1924 its prospects visibly brightened. De jure recognition was gained from Poland in December, 1923; from the Labor government of Macdonald in Great Britain, Feb 1, 1924; from Austria, Norway, and Italy in February; and from Sweden and Greece in March. Other countries seemed ready to follow their example. The Jugo-Slav minister of foreign affairs announced in July that he favored recognition of Russia but could not tolerate Communist propaganda. Rumania was "theoretically" ready to grant recognition but could hardly do so in practice as long as Russia refused to acquiesce in the Rumanian annexation of Bessarabia (q v.). Even France, hitherto the most irreconcilable antagonist of Soviet Russia, announced in June, 1924, through the Radical Socialist premier, Edouard Herriot, a readiness to negotiate regarding terms of recognition but did not follow the announcement with overtures to Moscow, possibly because of the recrudescence of extreme Communism in Russia Japanese negotiations with Karakhan, the Soviet envoy, were complicated by Russia's demand for the return of northern Sakhalin (q v) and Japan's insistence on prior claims to the oil resources of the region. Very significant as an indication of possible future relationships between Russia and the western powers were the agreements signed at London on Aug. 8, 1924, after somewhat acrimonious discussions between Soviet representatives and the Macdonald government: while maintaining in principle its decree of January, 1918, repudiating foreign debts, the Russian government recognized the claims of British bondholders to such limited satisfaction as circumstances permitted, and agreed also to a plan for the compensation of British nationals whose property had been confiscated by Communist decrees See the articles on FINLAND; ESTHONIA, LATVIA; POLAND; ARMENIA; AZERBAIJAN; GEORGIA; BOKHARA; TURKESTAN, RUSSIAN; KHIVA; SIBERIA AND FAR EASTERN REPUBLIC; CHINA; JAPAN; WRANGELL ISLAND; NAVIES OF THE WORLD; WAR, DIPLOMACY OF THE.

RUSSIAN LITERATURE. Russian literature was in an unfortunate condition at the beginning of the War. The neoromantic school was declining and the new tendencies were not yet clear. The War had little effect upon literature. Many of the authors, as Sologub and Chirikov, wrote on the War, but Andréev alone, with his play translated as *The Sorrows of Belgium*, rose above mediocrity Many of the books written during these years, as Sergyeyev-Tsensky's *The Oblique Helena*, did not even touch the War and all too many of the authors sympathized with the defeatists.

With the outbreak of the revolution in 1917 and the assumption of power by the Bolsheviks, a sharp break came in Russian literature Most of the better-known authors, especially those who carried on the tradition of Chekhov, fled abroad, like Kuprin. They continued publishing, but very little of this *émigré* literature could hope to survive. The greatest of these works is the *Road to Calvary* by Count Alexis N. Tolstoy. This is intended to be the first part of a trilogy and gives vivid pictures of the confusion in Petrograd during the War. The history of the period is resumed in Ataman Krasnov's *From the Two-Headed Eagle to the Bolsheviks*, a typical "White" novel which sets forth in glaring colors the sins and crimes of the Bolsheviks. We may mention here also Merezhkovsky who preaches that the Bolsheviks are Antichrist (*The Kingdom of Antichrist*), and Andréev who died in Helsingfors after writing *S.O.S.*, a brilliant journalistic attack on the Allied leaders for seeking terms of peace with the Bolsheviks Others of his works, as *He Who Gets Slapped*, do not touch the War and this is true of much of this *émigré* literature. The authors look back with longing and approval on the old world which came to such a rude and sudden ending.

Within Russia, conditions became steadily worse and the excesses of the communistic leaders toward the educated classes of the community drove author after author abroad or so weakened others that they fell an easy prey to disease. Thus Alexander Blok died in 1920 but to him we owe the greatest poems of the War. "The Twelve" describes the progress of a revolutionary patrol through the streets of Petrograd on a stormy night and as they pass along they are led invisibly by Christ who marches ahead without regard to the firing and the shots. The meter and the treatment sum up all of Blok's earlier work and the poem remains as the best representation of the spirit of the revolution. "The Scythians" is a challenge to western Europe and boasts of the great gulf that separates Russia from Europe and makes her a real intermediary between Europe and the Mongols.

With the exception of these works, little of value was produced. The same tendencies which had reigned before continued. There was the search for God of the followers of the philosopher Solovyev, often expressed in forms that seem little short of blasphemous, as Byely's "*Christ Is Arisen.*" The extension of the Third International into Asia and the tendencies of the Scythians are reflected in poems by Marienhof and Oryeshin, who boast of the new day when Asia can be matched with a weakened and decaying Europe. There is, of course, an infinite amount of verse, mostly of inferior quality, glorifying the Bolshevik régime and shouting out defiance to capitalism In the beginning the futurists were favored by the government and Vladimir Mayakovsky, with his masque on the conquest of heaven by the communists, became almost the official poet of the government, but he lost his influence and the growing stabilization of conditions moderated the tone of the more violent writers Among the writers of real merit, Anna Akhmatova probably ranks first. A quiet singer of love, she is drowned in the storms of lesser authors who compose the fifteen-odd schools of poets who contend in the name of art for supremacy. Others of note are Yesenin, the peasant husband of Isadora Duncan; Vyacheslav Ivanov, who continues his cult of the dying god undisturbed by the storms and tumults of the age; Pasternak, Erenburg and Marya Tsevtayeva.

The period was not so propitious for prose. Gorky was drawn into the service of the Soviet government and strove to help and support those intellectuals who remained in Russia.

Valery Bryusov, more classical than ever, devoted himself to a scientific study of Pushkin and Russian verse. Much attention was given to the discovery of hitherto unpublished works of older authors. Several fragments of Dostoyevsky were discovered but they do not seem to have added as much as had been expected to our knowledge of his works.

Poetry had the preëminence over prose, although during the last years a new school of prose writers developed, largely under the influence of Zamyatin. Among his followers we may mention the group known as the Serapion brothers, the chief of which is Nikolay Nikitin, and Zoshchenko. The stories are vivid and brutal and they lack the excessive stress on psychology which is characteristic of the pre-war literature. Other prose authors are Lebedinsky (*The Week*), and Pilnyak (*The Hungry Year*).

No summary of the literary world of Russia would be complete without mention of the Russian theatre. Despite almost insuperable obstacles the Moscow Art Theatre (see THEATRE) was held together and even greater progress was made in the developing of its art. Nevertheless, the actual production of plays fell behind the art of staging and the greater amount of attention was given to novel and effective renderings of many of the great plays of all ages and of all languages. In the winter season of 1922–23, a large part of the company under Stanislavsky made an extended tour through Europe and America. This extension of the Russian dramatic art and technic throughout the world was undoubtedly one of the great results of the revolution.

Russian literature showed a vitality which allowed it to survive conditions which overwhelmed all other parts of the national life. Not only did the fears of those who thought that it was doomed to perish prove needless but at the close of this period the literature, changed and transfigured, was very clearly starting again on a new era.

RUTGERS COLLEGE. A nonsectarian institution at New Brunswick, N. J., founded in 1766. The student enrollment in 1914 was 440 undergraduates in the fall term and 450 in the summer session, as compared with enrollment in 1923–24 of 743 undergraduates and 830 in the summer session of 1923. The trustees in 1918 established the New Jersey College for Women as an affiliated institution, not coeducational; in 1923–24, it had 419 undergraduates. The faculty of Rutgers College increased from 55 to 115 members and the library from 76,643 to 123,000 volumes. In 1916, the college celebrated the one hundred and fiftieth anniversary of its foundation in 1766 as Queen's College by charter from George III. Additional endowment was secured and in 1919–20 a million dollar campaign was carried to completion. The John Howard Ford Dormitory was built and furnished in 1914. A ceramics building and several buildings for the agricultural college were erected. The State College for the Benefit of Agriculture and the Mechanic Arts, maintained by the trustees of Rutgers College, was designated by the Legislature the State University of New Jersey in 1917. President, William H. S. Demarest, D.D., LL.D.

RUTH, GEORGE HERMAN (1894–). Professional baseball player, known to all fandom as the "Babe," born at Baltimore, Md. He joined the Baltimore International League Club in 1914 and was sold to the Boston Club of the American League in 1915. He was bought by the New York American League Club in 1920 for $150,000, the largest sum ever paid for a ball player. As a member of the "Yankees" he established a world's record by knocking out fifty-nine home runs during the season of 1921 and for his all-around work in 1923 was voted the most valuable player in the American League.

RUTHENIA. See CZECHO-SLOVAKIA; GALICIA, EAST.

RUTHENIANS. See BUKOVINA; GALICIA; UKRAINE.

RUTHVEN, ALEXANDER GRANT (1882–). An American zoölogist, born at Hull, Iowa, and educated at Morningside College and the University of Michigan. He was instructor in zoology and curator of the museum (1906–12), and professor of zoölogy and director of the museum (1912–) at Michigan. His publications were on the reptilia, and he collaborated with Schull and La Rue in *Principles of Animal Biology* (1920).

RYAN, HARRIS JOSEPH (1866–). An American electrical engineer, born at Powell's Valley, Pa., and educated at Cornell University. He became an instructor in physics at that university in 1888 and a year later was made professor of electrical engineering; this chair he held until 1905, when he accepted a call to a similar professorship at Stanford University. During the War he was director of the anti-submarine laboratory of the National Research Council at Pasadena, Cal. He gave much attention to methods for electrical engineering tests and measurement; the laws governing relation of size and separation of conduction; and electric pressure at which corona and power waste appear in high-pressure power transmission lines. Professor Ryan was a member of the Jury of Awards at the World's Fair held in Chicago in 1893 and at that held in San Francisco in 1915. In addition to many papers and monographs on electrical subjects variously contributed, he wrote *Textbook of Electrical Machinery* in collaboration with H. H. Norris and G. L. Hoxie.

RYAN, JOHN DENIS (1864–). An American capitalist, born in Michigan. He was a director and official in many important copper mining companies and in 1918 was appointed director of aircraft production by President Wilson. In the same year he served as second assistant Secretary of War and director of the Air Service. He was also a member of the War Council of the American Red Cross.

RYKOV, ALEXIS IVANOVITCH (1881–). A Russian statesman, born at Saratov, and educated at the University of Kazan, where he studied engineering. He was many times jailed for political reasons. In 1903, while studying his specialty, economics, at Geneva, he met Lenine, and from that time the two were close friends. Rykov led the revolt of 1905 so successfully that he was elected to the Central Committee of the Social Democratic Labor party. In the first Bolshevik cabinet he was People's Commissar for the Interior; later he was head of the Supreme Council of National Economy.

He was first vice president of the Council of People's Commissars of Russia and was virtually premier during the illness of Lenine, on whose death he became Premier of Soviet Russia. Among his first acts as premier was the order of an issue of silver coins to provide small change for the peasants and the formulation of plans for a better working relationship between the farmers and the industrial workers. He wrote much in the field of economics.

S

SAAR BASIN. A region created by the Peace Conference, contiguous to the northeast boundary of France. Area, 1920 square kilometers; population in 1910, 649,509, in 1919, 589,773, of whom 110,623 were in the town of Saarbrücken. The inhabitants before 1919 were entirely German, except for some 3000 French. The basin, a continuation of the great Lorraine coal field, was drawn to coincide with the mines and their dependent industries, as well as with the limits of the coal deposit In 1912-13, coal produced amounted to 17,473,000 tons (6 per cent of the total German output, though 40 per cent as great as the total French); steel produced, 2,080,000 tons Glass and pottery works came next in importance. There were 72,700 miners employed, and some 50,000 other industrial workers. In 1920, 9,198,714 tons of coal were produced, and in 1922, 10,943,311 tons; to the latter figure should be added the 296,692 tons produced at the privately owned Frankenholz mine.

The final disposition of the Basin hinged on the successful culmination of the struggle between the principles of annexation and reparation. On the score of historical and ethnographical rights, French claims for outright annexation were of course lamentably weak, while strategically there could be no reason for the cession in the light of the forced demilitarization of the left bank of the Rhine. But as compensation for the willful destruction of French coal mines at Lens and Valenciennes, there was every ground for serious consideration of the French position. The final solution, as embodied in Articles 45–50 of the Treaty, was to turn over to the French in absolute ownership all the coal deposits of the territory, the value of the mines to be credited to the German reparation account; give the French the right to improve the existing systems of communication, or to create new ones, and to employ French currency; and incorporate the area in the French customs régime To avoid the indignation which would have been evoked by outright French annexation of the territory, the Peace Conference made the Saar Basin a separate state, to be administered by an international governing commission of five members, representing the League of Nations. These were to be named by the League Council for one year. The commission was to have full sovereign rights including those of levying taxes and dues. Before modifications of the law or new taxes, except customs, could be effected, the commission had to consult elected representatives of the population. This was, however, to be a temporary expedient. For the ultimate determination of the Basin's status, a plebiscite in 15 years (1935) was provided for by the Treaty. Then, every person over 20 years who had been a resident in 1919 was to have the right to vote for one of three possibilities: the international status in force at the time, union with France, or union with Germany. In the event of the reestablishment of German sovereignty, the mines were to be repurchased by Germany. On Jan. 10, 1920, the League of Nations took control, after a period of military occupation; eight days later, the French took over the mines One of the first acts of the commission was the extension of the free customs union between the Saar and Germany for five years. In June, 1922, elections took place for members of a consultative council which the commission established to aid in the work of administration. Of the 30 members, 16 were Catholic Centre, 5 Right Socialist, and 4 Liberal The maintenance of French troops in the Basin and the drastic curtailment of liberty of the press by French courts-martial provoked bitter resentment among irreconcilable elements of the population and evoked protests from liberal leaders in England and the United States, but on the whole the governing commission was far more successful in averting violent popular resistance than might have been anticipated, in view of the nationalist sentiments of the German population.

SABATINI, RAFAEL (1875–). An Italian author and dramatist, born at Jesi, and educated in Switzerland and Portugal He wrote many exciting highly colored romances dealing with various critical periods of history. Several of his books, notably *Scaramouche* and *The Sea Hawk*, were made into highly successful motion-picture plays. His writings include: *The Lion's Skin* (1911); *The Life of Cesare Borgia*, a history (1912); *The Justice of the Duke* (1912); *Torquemada and the Spanish Inquisition*, a history (1913); *The Gates of Doom* (1914); *The Sea Hawk* (1915); *The Snare* (1917); *Scaramouche* (1921); *Captain Blood* (1922); *Fortune's Fool* (1923); *Bardelys the Magnificent*, with Hamilton; *The Fugitives; The Rattlesnake* with J. E. Harold Terry; and *Mistress Wilding* (1924).

SABOTAGE. Legislative action against sabotage made its appearance in the United States in 1917 and reached its crest in 1919. By that time no less than 16 States, Alaska, and Hawaii had enacted such laws. The States were Arizona, California, Idaho, Iowa, Kentucky, Michigan, Minnesota, Montana, Nebraska, North Dakota, Ohio, Oklahoma, Oregon, South Dakota, Utah, and Washington. Most of the laws were aimed at "criminal syndicalism," which was defined to include advocacy of sabotage. Several laws were more specific. Thus Arizona defined sabotage as willful and malicious injury to property, or violation of the constitutional or statutory rights of another, as a means of accomplishing industrial or political ends. Nebraska's definition covered railroad property, highway bridges,

manufacturing plants or equipment, or any farm or manufactured product. Sabotage was defined by North Dakota as setting grain or food products on fire or poisoning any work or food producing animal with an intent to hinder or lessen the food supply. Montana defined sabotage as malicious, felonious, intentional, or unlawful damage, injury, or destruction of property; and Washington made it a felony to injure or derange property in order to obstruct any industrial enterprise, to interfere with the management, or to advocate such tactics. The movement against "criminal syndicalism" and sabotage, apparently a product of war psychology, stopped with the legislative grist of 1919. Only one State, Kentucky, acted since; and then, in 1922, only to make her law less severe.

SAINT CATHERINE, COLLEGE OF. A Roman Catholic college for women at St. Paul, Minn., founded in 1911. The board of trustees was organized in 1917. The number of students enrolled increased from 61 in 1914 to 413 in 1924, the members of the faculty from 11 to 35, and the library from 6000 to 17,000 volumes. The total yearly income rose during the same period from $40,000 to $352,720, and the endowment from nothing to $376,000. President, Sister Antonia.

SAINT ELIZABETH, COLLEGE OF. A Roman Catholic college for women, conducted by the Sisters of Charity, founded at Convent Station, N J., in 1899. The student enrollment increased from 91 in 1913–14 to 248 in 1923–24; the faculty rose from 22 to 35 members, and the library from 9000 to 14,000 volumes. The annual income increased from $30,700 to approximately $128,000. There was no endowment, but the sisters gave their services without remuneration. The curriculum was considerably enlarged, with additional courses in the departments of English, history, music, home economics, and sociology, and a course in leadership of girl scouts. Sister Mary Pauline Kelligar, LL.D., was president until her death in 1923. Dean, Sister Mary Jose Byrne, Ph.D.

SAINT GERMAIN, TREATY OF. See AUSTRIA; PEACE CONFERENCE AND TREATIES.

SAINT JEAN DE MAURIENNE, AGREEMENT OF. See PEACE CONFERENCE AND TREATIES; WAR, DIPLOMACY OF THE.

SAINT LOUIS. The chief city of Missouri and the sixth in population in the United States, with an area of 61.37 square miles. The population, which was 687,029 in 1910, increased to 772,897 in 1920, and by estimate of the Bureau of Census (July 1, 1924) to 812,698. In February, 1923, the city, by a vote of the people, authorized an issue of bonds for the amount of $87,372,500 for a large number of public improvements. Of the total amount of bonds voted for, $12,000,000 was for a new waterworks plant, 15 miles west from the city limits, on the Missouri River. A reservoir, with a capacity of 200,000,000 gallons, was to be constructed at the highest point in St. Louis County. Another great project, the largest under the bond issue proper, was the construction of the River des Peres sewer and channel, for which $11,000,000 in bonds was voted. The drainage works were to consist of closed sewers from the city limits west of Delmar station through Washington Heights and Forest Park to Manchester Avenue; these sewers were to carry both sewage and floods. It was said that these sewers would constitute the largest completely closed drainage system on record. St. Louis has many beautiful parks. One, Forest Park, composed of over 1300 acres, is famous for its natural and artificial beauties. The Zoölogical Garden was started under an ordinance passed in December, 1913. It has been supported, like the Art Museum and the Public Library, by the revenue of a mill tax. It was governed by a board of trustees from August, 1917. It is considered one of the finest in America. The Missouri Botanical Garden, popularly called Shaw's Garden, is widely known. It contains 135 acres. With the exception of that connected with Harvard University, it is said to be, in specimens, library, growing plants and trees, the finest in the world. The zoning ordinance of 1918, under which many plans were made and much work done during a period of six years by the City Plan Commission, was declared invalid by the Missouri Supreme Court in decisions made public in October and November, 1923. The Court held that under the charter no such police power was given to the city and that zoning could be undertaken only through eminent domain. Work on the Major Street Plan as adopted by the Commission in 1916 progressed, and much of the minor work had been completed by 1924. There are four bridges over the Mississippi River, one of which was the Municipal Free Bridge, the largest double-deck steel-span bridge in the world. The weight of the western approach is 7,938,446 tons; channel spans, 13,925,660 tons; eastern approaches, 23,919,786 tons. Total length of the railway deck is 3.459 miles; of the highway, 1.853 miles. The cost of the bridge was $6,288,435. It was built under the supervision of the Department of the President of the Board of Public Service The public schools were known for their excellence. There were 123 grade schools, six public high schools, a junior high school, a trade school, and a teachers' College. Teachers numbered 2554, and nearly 100,000 pupils were enrolled in 1924. There are also many private schools and academies and the Washington and St. Louis Universities. There are 26 lines of railroads entering the city. Factories total more than 3300, with an invested capital over $600,000,000. For the years 1914–24, the tax rate for all purposes on each $100 of assessed valuation varied from $2.22 in 1914 to $2.55 in 1921. See RAPID TRANSIT.

SAINT LOUIS SYMPHONY ORCHESTRA. See MUSIC, *Orchestras.*

SAINT MARY'S FALLS CANAL. See SAULT SAINTE MARIE, CANALS AT.

SAINT MIHIEL. See WAR IN EUROPE, *Western Front.*

SAINT PAUL. The capital of Minnesota. The population increased from 214,744 in 1910 to 234,698 in 1920, and to 241,891, by estimate of the Bureau of the Census, for 1923. St. Paul regained her old position as the head of navigation on the Mississippi River, with water connections to St. Louis and New Orleans. A municipal dock was equipped with the most modern facilities, and the Federal government built a number of modern steel barges and towboats. A school bond of $3,000,000 was voted in 1917, and in 1919 the $6 per capita limit for school taxation was removed. The James J. Hill Reference Library and Public Library was built during the period. In 1917, after a housing survey had been made, a city planning ordi-

nance was passed providing for a city planning commission of 25 citizens appointed by the mayor. This commission recommended improvements designed to give better routing of traffic across and around the city in order to relieve the congestion in the business districts. The next year a zoning ordinance was adopted providing for six use districts, including three residence, one commercial, one light industrial, and one heavy industrial, and four height districts limiting the buildings to heights varying from 40 to 150 feet Two new reinforced concrete bridges were begun in 1924 which were expected to cost more than $3,000,000. Bank clearings increased from $576,156,228 in 1910 to $1,593,-657,574 in 1922; the number of factories increased from 737 in 1914, capitalized at $101,-789.920, employing 31,430 and making products valued at $103,683,000, to 849 in 1919, capitalized at $155,685,000, employing 41,256 and making products worth $215,000,000.

SAINT PIERRE AND MIQUELON. The principal islands of two groups off the south coast of Newfoundland, belonging to France. Total area, 93 square miles; population (1921), 3918, which was increased to 12,000 during the fishing season. The only activity was cod fishing. Great gains were made in cod fishing during and after the War, as the trade records reveal. Imports for 1913, 1920, and 1921, were 4,536,745 francs, 40,846,742, and 22,989,000. Exports for the same years were 6,201,798 francs, 28,047,100, and 19,691,000. Almost all the exports went to France, while only a small proportion of the imports, 2 per cent in 1919, came from the mother country.

SAINT QUENTIN. See WAR IN EUROPE, *Western Front*.

SAINT THERESA, COLLEGE OF. An institution for women, founded by the Sisters of St. Francis at Winona, Minn., in 1910. The student body in 1923–24 numbered 420. Between the time of its foundation and 1924 the college acquired buildings of an estimated value of $2,000,000, and a productive endowment of $500,000. A chapel and a faculty house were in process of construction in 1924. In 1920 the Saint Clare School of Education was organized in connection with the college to train teachers for the parochial schools, the first fully organized and accredited school of its kind in the country. It offered a two-year course to high school graduates. President, Mother M. Leo Tracey.

SAJOUS, CHARLES E. DE M. (1852–). An American physician (see VOL. XX). In 1921 Dr. Sajous was appointed professor of endocrinology in the University of Pennsylvania. In 1922, his well-known work *The Internal Secretions and the Principles of Medicine* passed through its tenth edition and in the same year his *Analytic Cyclopædia of Practical Medicine* appeared for the ninth time. Dr. Sajous resigned as editor of the *New York Medical Journal* in 1919, after having served in this capacity since 1911.

SAKHALIN. An island off the east coast of Siberia. The region to the north of the parallel of 50 degrees was Russian territory and part of the Sakhalin Province. It has an area of 14,668 square miles and a population of 34,000 (1915). Eighty per cent of the region was covered with forest, and lumbering was the chief occupation. Japanese Sakhalin, or Karafuto, had an area of 13,148 square miles and a population of 105,765 in 1920, as compared with 39,846 in 1913 Under the Japanese the exploitation of their territory was rapidly pushed. The herring fisheries had the greatest economic value, while the presence of great forests indicated that lumbering and papermaking would soon become important. Pulp mills were already established in 1924. An enlightened government interest encouraged agriculture, and settlers were provided with land, domestic animals, and seed. Three coal basins yielded 154,193 tons in 1920. By 1917 exports had already reached a value of 17,293,000 yen and imports 11,723,000 yen. The budget for 1921–22 balanced at 14,045,806 yen; the subsidy from the Japanese Treasury was about 750,000 yen. In 1920, Japanese forces occupied the Russian portion as a result of the so-called massacre of Nikolayevsk, the capital of Sakhalin Province on the Amur River, when all the Japanese residents, numbering about 350, were slain. Responsibility was difficult to establish, and against the protests of the Russians, the Japanese troops stayed on (1924). At a Russo-Japanese conference held on Sept. 4, 1922, Japan demanded reparations as the price of withdrawal. In August, 1924, after long discussions between the Russians and the Japanese, a basis for an agreement was announced. The terms of this Russo-Japanese convention were said to include: Japanese evacuation of Sakhalin; the grant of a 55 year concession to Japanese capitalists in the oil fields of North Sakhalin; Soviet recognition of the fishery rights conferred by the Treaty of Portsmouth (1905). That the British government would oppose this agreement was inevitable, for it was pointed out that the Britsh Shell group held a previous concession to the oil fields in question. See JAPAN; RUSSIA; SIBERIA AND FAR EASTERN REPUBLIC.

SALANDRA, ANTONIO (1853–). An Italian statesman (see VOL. XX). At the outbreak of the War, he opposed Italy's joining her forces with Germany and Austria on the ground that theirs was an aggressive war. The majority of the Italians supported him, and when opposition caused him to resign in May, 1915, feeling on behalf of Salandra and the Allies rose to such a height that it actually threatened the throne. "War or a republic" was the cry. The King refused to accept Salandra's resignation, and in 10 days Italy entered the War on the side opposed to her ancient enemy and oppressor, Austria. Salandra's premiership lasted till June, 1916.

SALONIKI. See WAR IN EUROPE, *Balkan Front*.

SALT LAKE CITY. The capital of Utah. The population increased 27 per cent, from 92,-777 in 1910 to 118,110 in 1920, and to 126,241, by estimate of the Bureau of the Census, for 1923. The water supply of the city was nearly doubled in 1915 and 1916 by two dams in Big Cottonwood Canyon, impounding 550,000,000 gallons of water. Smoke regulating ordinances and a use zoning law were adopted, and a municipal bathhouse was built. Bishop Charles W. Nibley in 1922 presented a 56-acre golf course to the city. Bank clearings fell from $825,360,-260 in 1919 to $661,686,278 in 1921 and rose again to $785,320,679 in 1923; building permits increased 72 per cent, from 1115 valued at $4,-060,496 in 1919 to 1344 valued at $6,976,494; the value of manufactured products rose from $35,000,000 in 1914 to $103,814,000 (estimated)

in 1923; and the production of coal rose from 3,088,356 tons in 1912 to 4,627,570 in 1923, an increase of 59 per cent.

SALVADOR. The smallest of the Central American republics, with an area (officially estimated) of 13,176 square miles and a population (census of 1923) of 1,360,382. The official estimate for 1913 was 1,225,835 A slight increase was evident during the period in school enrollments, the figure for 1913 being 50,550, and for 1921, 57,555. But from 1919 on, the government applied itself seriously to eradicating illiteracy; 70 per cent of the population was reported as unable to read or write. Populations of the large cities were: San Salvador, the capital, 80,900; Santa Ana, 70,000; San Miguel, 33,900; San Vicente, 30,080; Nueva San Salvador, 25,960. On June 7, 1917, an earthquake and volcanic eruption did much damage to the capital and partially destroyed several smaller towns. An earthquake of great intensity shook the city of San Salvador on Apr. 28, 1919.

Industry. Coffee culture remained the leading activity, and an average of 65,000,000 pounds was exported annually. The 1923 production was 60,000 metric tons, valued at $16,800,000. Sugar made considerable advances, with a 1923 production of 20,000 tons. Cacao, rubber, tobacco, and wheat for local consumption were given increasing attention. After 1914 gold and silver mining showed possibilities, especially in the departments of Morazán, San Miguel, and La Union. The foreign trade from 1913 on increased regularly· exports in 1913, $9,011,112; in 1920, $17,943,827; in 1922, $16,213,805. Coffee averaged 80 per cent of the export value. Other exports were· sugar, henequen, gold and silver coin, balsam, hemp, hides, and rubber. The United States took 70 per cent of the coffee; Great Britain, 4 per cent. Imports in 1913 were valued at $6,174,000. In 1922, they were $7,426,760 but in 1919 they had reached the high figure of $14,958,196. Leading imports were cottons, hardware, flour, drugs, and chemicals. Trade with the United States in 1913 was: imports, $2,491,000; exports, $2,824,000. Imports in 1922 were $4,878,137; exports (1921), $3,296,622. Trade with the United Kingdom in 1913 was: imports, $1,604,000; exports, $706,000. In 1921 it was· imports, $222,356; exports, $1,263,561. In the period 1914–24 Salvador began to develop industrially and besides supplying many articles for domestic consumption exported manufactured products to neighboring countries. Local mills embraced the manufacture of cotton and silk fabrics, leather goods, fibre goods, cigars, cigarettes, sugar, etc. Electrical power was being used. Stock raising was also gaining in importance.

Finance. For 1914–15 the revenues were $6,286,470 and the expenditures $6,263,878. For 1922 they were $5,771,332 and $6,120,473. The national debt in 1913 was $10,995,854. On Dec. 31, 1921, it was $16,834,105. A $6,000,000 loan was negotiated in the United States in 1923. The three banks of issue on Dec. 31, 1921, had notes in circulation to the value of $3,508,910. The colon in 1919 was fixed at $0.50 and by the law of July 16, was made the monetary unit.

Communications. In 1922, 253, miles of railway were open, all of narrow gauge. The International Railways line from east to west was completed in 1922 when the third section was opened from San Vicente to Cojutepeque. The railway starts at La Union. In 1921 there were 2374 miles of telegraph wire and 1366 miles of telephone line.

History. Salvador was the first country to move toward effecting a better understanding among Central American states. On June 24, 1920, it sent out an invitation for a general meeting, and conferences were begun at Antigua in Guatemala on Nov. 1, 1920. On Jan. 21, 1921, a pact was signed by Salvador, Honduras, and Guatemala for a Central American Union (q.v.), thus crowning with temporary success the aspirations of a century. Salvador was the only Central American country not to declare war on Germany. In 1913 Salvador signed an arbitration treaty with the United States and a commercial treaty in 1919. Considerable local ill-feeling was generated toward the United States because it was felt that the Bryan-Chamorro treaty of 1916, in giving the United States a naval base on Fonseca Bay, violated Salvador's sovereignty. Suit was made before the American Court of Justice, and although the complaint was successful, both Nicaragua and the United States disregarded Salvador's contention. Peace was general in the country after 1914 as a result of the insistence of the United States. President for 1919–23, Jorge Meléndez; for 1923–27, the vice president, Alfonso Quinónez Molina, was raised to the presidency. Late in 1923 much interest was aroused in the United States over the terms of a $6,000,000 loan floated in New York City. The contract, which was to a large extent the work of ex-Secretary of State Lansing, provided in effect for the underwriting of the loan by the United States government. A special stipulation called for the submission of differences or interpretatons arising out of the loan's terms to the United States Supreme Court Chief Justice.

SALVARSAN. See SYPHILIS.

SALVATION ARMY. A religious organization aiming to evangelize the masses who are outside the influence of the churches, founded by the late Gen. William Booth in London in 1865, and incorporated in New York State in 1899. In the years between 1914 and 1923 the number of corps and outposts increased from 852 to 1325, the number of indoor meetings from 197,099 to 442,485, and the open-air meetings from 150,055 to 201,042. The number of officers and cadets rose from 3225 in 1916 to 4090 in 1923–24, and the number of converts from 53,483 to 100,159. Various sorts of rescue work were carried on. Over 100 industrial homes were maintained, and about 85 hotels for men and women, slum posts, and 13 nurseries, 31 maternity and rescue homes, 8 children's homes, and 10 hospitals and dispensaries. The army also conducted extensive work among prisoners; in 1923, through their efforts, 604 prisoners were paroled to the organization. Other familiar lines of their work included Christmas and Thanksgiving dinners given to the poor, summer outings to mothers and children, employment fund for men and women, and distribution of ice and coal.

During the War the Salvation Army was active in the belligerent areas and the army camps. Great quantities of clothing were collected for refugees and much relief work accomplished. By the close of the War the Salvation Army had sent 246 officers and employees to France and

100 to army camps and was maintaining 50 huts ments in France and 20 in this country, 24 ambulances for government service, 50 rest rooms for men in the service, and 20 hospitals, of which one was in France.

SALZBURG. A province of the Republic of Austria. Its area in 1910 and 1923 was 2761.9 square miles. Its population in 1910 was 214,737; in 1923, 222,731. See AUSTRIAN REPUBLIC.

SAMOA. See PACIFIC OCEAN ISLANDS.

SAMOA, AMERICAN. American Samoa comprises the island of Tutuila and several other small islands in the Pacific Ocean. The population in 1920 was 8058, compared with 7251 in 1912 and 7376 in 1916. The people are almost entirely Samoans. In 1920, these included 3166 males and 3019 females.

Products. The soil of American Samoa is rich and well-adapted to the growing of fruits, which include the orange, lemon, lime, citron, mango, alligator pear, pineapple, banana and other native fruits. The vegetables grown include the bread fruit, taro and yam. Sugar cane is grown to some extent, especially for the leaves which are used for thatch on the native houses. Coffee also has been grown in small quantities with success and tobacco is grown by the natives for native consumption The most important product of the soil, however, is the coconut, which is used as food for the natives, while the water of the green nuts is used for drink. Copra, the dried kernel of the ripe coconut, forms the chief article of commerce, and is the only export from American Samoa. It is shipped to foreign countries where oil is expressed from it. This oil is in great demand in the manufacture of coconut butters of various kinds, soaps oil for salads, and for other purposes. During the decade 1913–23, and, indeed, since the American occupation, the government has encouraged the natives to plant more coconuts and to use better methods of drying the copra. The copra sold in 1914 was 2,551,027 pounds valued at 122,965; in 1918, 3,067,177 pounds, valued at $187,481, and in 1920, 2,208,803 pounds valued at $154,616.

Industries. There are practically no industries in the islands. Copra is dried by spreading it in the sun Native women manufacture floor mats and sleeping mats from the leaves of the pandanu, but these are not often for sale. War clubs, fans, baskets, hats and necklaces of shells and beads are made to sell to tourists.

Education. The foundation of the school system of American Samoa is the parish school conducted by the native pastors of the various denominations. There is no government supervision except that by law all children between the ages of six and 13 are required to attend school regularly. Schools are maintained by Roman Catholics, Wesleyans, Mormons, and by the London Missionary Society. Since 1904, the Marist brothers have conducted a special district school at Leone. Prior to 1921 there was but one school which could actually be called a government or public school In January of that year Governor Evans instituted plans for a widespread development and expansion of the public school system throughout Samoa. A Board of Education was appointed and as a result Tutuila was divided into 13 school districts and the Manua district into two, for the purpose of establishing a graded school in each of these districts. In 1923 three such graded schools had already been established. The average attendance in the various schools is about 3000.

Trade. As noted above, copra is the only export. Imports are increasing from year to year and mount up to about $250,000 annually. About half these are from the United States.

Finance. American Samoa has no public debt. The bank is conducted under the supervision of many officials. The customs revenues are used for the upkeep of roads, schools and general island government expenses. The navy tax fund is chiefly used for the pay of native officials.

Transportation. A monthly schedule is maintained between San Francisco, Honolulu, Pagopago and Sydney, by the Oceanic Steamship Company. Over 50 miles of roads have been constructed since American occupation.

Health and Sanitation. As a result of sanitary supervision, education and free medical treatment, the natives of American Samoa have increased in numbers 41 per cent under the American occupation, from 1900 to 1920. The prevailing diseases are hookworm, influenza, and filariasis. At various times there have been serious epidemics of measles. Malaria, cholera and smallpox are unknown in Samoa. The government maintains dispensaries and a sanitation inspector makes public inspection of all villages. As a result, health conditions in the island have remained good during the decade.

SAMUEL, HERBERT (LOUIS) (1870–). An English public official (see VOL. XX). He was chancellor of the Duchy of Lancaster for the second time in 1915–16 and also Postmaster General. In 1916 he became Secretary of State for Home Affairs and held other important offices. In 1919 he was British Commissioner to Belgium and in the next year became High Commissioner of Palestine, where the handling of a delicate situation caused by the fierce clashing of mutually hostile nationalities called forth all his ability in diplomacy and fair dealing. Up to 1924 he had succeeded in averting serious outbreaks. In 1917 he wrote *The War and Liberty*.

SAN ANTONIO. The largest city of Texas. The population increased 67 per cent from 96,614 in 1910 to 161,379 in 1920, and to 184,727, by estimate of the Bureau of the Census, for 1923. During the decade 1914–24, San Antonio became the centre of a large oil-producing territory. The first field was discovered in 1915 at Somerset, 18 miles south of the city; in 1919 it produced 95,000 barrels of oil; in 1923, 1,250,000 barrels. Large fields at Luling, Mirando, and Calliham were subsequently discovered. Seven junior high school centres were completed at a cost of $1,500,000. A bond issue of $4,150,000 was voted for public improvements, including $2,800,000 for a flood protection programme and an additional $200,000 to be added to the $500,000 previously voted for a municipal auditorium Building permits increased from $2,619,060 in 1919 to $8,672,029 in 1923. A heavy flood inundated the city in 1921 when Olmos Creek and the San Antonio River were swollen by prolonged and violent rains; this caused a property loss of about $10,000,000.

SANDBURG, CARL (1878–). An American poet and editor, born at Galesburg, Ill., and educated at Lombard College of that city. He served as a private in the war with Spain

in 1898, was secretary to the Mayor of Milwaukee, Wis., from 1910 to 1912, and in 1913 went to Chicago, where he became associate editor of the magazine *System*. He did newspaper writing for a while, received the Levinson Prize from the *Poetry Magazine* in 1914, and had a half share in the prize of the Poetry Society of America in 1919. One of the first to follow Masters in the use of free verse, Sandburg soon came to be recognized as the leader of the western poets. His verse was harsh and unrythmic; his themes tended to be brutal and showed too great a fondness for the so-called primitive character of American civilization; there were, perhaps, too many references to smokestacks, iron, grime, dirty alleys, and the like. But there was also beauty in his poetry and a sensitiveness which even his realistic preoccupations could not obliterate His writings include: *Chicago Poems* (1915); *Corn Huskers* (1918); *The Chicago Race Riots* (1919); *Smoke and Steel* (1920); *Slabs of the Sunburnt West* (1922); *Rootabaga Stories* (1922); *Rootabaga Pigeons* (1923).

SANDERSON, JULIA (1887–). An American actress and singer, born at Springfield, Mass. She made her début with the Forepaugh Stock Company in Philadelphia and in 1902 came to New York City, where she first appeared at the Casino in *Winsome Winnie* and later as Mrs. Pineapple in *A Chinese Honeymoon* and in other popular rôles. After playing in *The Honorable Phil* in London, she toured the United States as Dora Dale in *The Sunshine Girl*, appeared in the musical comedy *The Girl from Utah* with Donald Brian and Joseph Cawthorn (1915), and starred with the *Sybil* company (1916–17)

SAN FRANCISCO. The second city in California. The population increased from 416,912 in 1910 to 506,676 in 1920, and to 539,038, by estimate of the Census Bureau, for 1923. During the decade between 1910 and 1920, work was progressing on the Hetch Hetchy Water Supply System. For an account of this and other important developments in connection with its water supply, see AQUEDUCTS and WATER WORKS. The Panama-Pacific International Exposition, commemorating the opening of the Panama Canal, was held in San Francisco during nearly the whole year of 1915, from February 20 to December 4. Thirty-nine foreign nations and 40 States and territories were represented by industrial and artistic exhibits Of the elaborate buildings erected for the fair, the Municipal Auditorium, at the Civic Centre, was of permanent construction; it cost $1,086,000. The total cost of the fair was about $50,000,000. On the close of the exposition the grounds were converted into a residence park. Other buildings constructed at the Civic Centre during the decade included the $3,500,000 City Hall, a four-story building with a ground area of 278 by 415 feet and a central dome 112 feet in diameter, over 300 feet high; the Public Library, a building 190 by 305 feet, designed in Italian renaissance style, costing $1,153,000, and with a capacity of 500,000 volumes; and the State of California Building, erected at a cost of $1,350,000 to house State courts and other offices. Park Commissioner and Mrs. Adolph Spreckels gave the city a new Museum of Fine Arts, copied exactly from the Palace of the Legion of Honor in Paris. It contained exhibits of work by French, Belgian, Rumanian, Polish, Greek, and Jugo-Slav as well as native artists, and a collection of Sèvres porcelain and Gobelin tapestries

After careful study and mapping under the direction of the City Engineer, the City Planning Commission completed and secured the adoption in 1921 of an ordinance dividing the City into six use zones. In the same year the City Engineer began studies of the rapid transit system of the City, preparatory to making plans for a four-track subway to run for two and one half miles under Market Street, from the ferry to Valencia Street. The development of a large new residential area was made possible by the completion of a tunnel 12,000 feet long and an electric railway through Twin Peaks. After a series of hearings and investigation of the project and the various alternative plans presented, the United States War Department in 1923 gave permission, and work was started on the construction of a cantilever bridge across Carquinez Straits between Vallejo and Valcona, spanning one of the upper reaches of San Francisco Bay. It was to consist of a central pier and two 1100-foot spans and would be the third largest cantilever bridge ever constructed. It was for vehicular traffic exclusively. Permission was also granted for two vehicular bridges across the lower end of San Francisco Bay One was to have its western end at Little Coyote, about 24 miles by highway south of the City, and was to be six miles long and to cost about $10,000,000, including seven miles of approach roadway. The plans demanded a 200-foot lift span, a series of arches of 250-foot span across a mile of deep water, and shorter arches, trestle, and fill over the shallow water and tidal marsh. The other bridge was to be at Dumbarton. Various projects were discussed for connecting San Francisco and Oakland, and there were also under way for the spanning of the Golden Gate the world's longest cantilever bridge, to connect San Francisco with Marin and the other counties to the north.

The school system was thoroughly revised in 1922, following, for the most part, the recommendations incorporated in a report which the United States Bureau of Education made on the schools at the request of the city.

Among other accomplishments of the City of San Francisco since 1910 were the building of the first municipally-owned street railways in the United States. In 1924 the Municipal Railways had 68 miles of track; consistently maintained a five-cent fare; paid all interest charges on its bonds, amounting to $2,000,000 in 1923; retired bonds aggregating $1,090,900; earned the money to build extensions costing $1,791,208, and still had a credit in the City Treasury of $1,680,913. Two tunnels were bored beneath the city's hills, the Twin Peaks tunnel, 2¼ miles long, 25 feet wide, and costing $4,750,000; and the Stockton Street tunnel, 911 feet long, 50 feet wide, and costing $650,000. A $5,750,000 high-pressure fire protection system was installed. More than $20,000,000 in streets and boulevards were built and maintained. Fourteen new public playgrounds, with a combined area of 125 acres, were opened. The city also had the world's largest outdoor swimming pool, 1000 feet long and 150 feet wide. The San Francisco Hospital was built, a public institution ranking among the three largest and finest hospitals in the world. James Rolph, Jr., was elected mayor of San Francisco in 1912 and

was reëlected; his term was to expire in 1928. See RAPID TRANSIT.

SANGER, MARGARET H. (1883–). An American birth control advocate. She was active in birth control propaganda after 1914. Frequently arrested, she served a 30-day sentence in 1916. At other times her case was dismissed on appeal. Her first husband, the architect William Sanger, was also tried and convicted in the New York courts in 1915. Mrs. Sanger was editor of the *Woman Rebel*, which gave way in 1917 to the *Birth Control Review*. The latter publication, with a circulation in excess of 100,000, was the organ of the American Birth Control League in which were grouped prominent club women and social workers interested in the population question. Mrs. Sanger, as president of the league, directed an international propaganda for breaking down the taboos on birth control information. She lectured in various parts of the United States and in Japan, and called to her support English publicists like Harold Cox, editor of the *Edinburgh Review*, and Havelock Ellis. In New York her propaganda was at times opposed by prelates of the Catholic Church. After one meeting at the Town Hall was suppressed through the intercession of Archbishop Hayes, Mrs. Sanger held other meetings in which Catholic dignitaries were present. After the death of her first husband, Mrs. Sanger married, in 1922, J. Noah H. Slee, a capitalist who was interested in the activities of the Birth Control League. Besides writing numerous pamphlets, Mrs Sanger was the author of the following books: *What Every Girl Should Know* (1914); *What Every Mother Should Know* (1916); *The Case for Birth Control* (1917); *Woman, Immorality, and Birth Control; Woman and the New Race*, with a preface by Havelock Ellis (1920); *The Pivot of Civilization* (1922); *The New Motherhood*, with introductions by Harold Cox and Havelock Ellis (1922).

SANGSTER, MARGARET ELIZABETH (MRS. CARROLL M. SHERIDAN) (1894–). An American author, born in Brooklyn, N. Y. She became associate editor of the *Christian Herald* in 1913 and in 1918 she visited Belgium, Germany, and France as correspondent for that periodical. Her poems and stories include: *Friends o' Mine* (1913); *Real People and Dreams* (1914); *Cross Roads* (1919); *The Island of Faith* (1921); *Your Book and Mine* (1923).

SANKEY COMMISSION. See GREAT BRITAIN, *History*

SAN MARINO. A republic of Europe located in the peninsula of Italy. Area, 38 square miles; population, 12,027, in June, 1920, as compared with 10,489 in 1910. Revenues and expenditures for 1922–23 amounted to $165,405 and $173,830 (at current rate of exchange). In 1914 these were $193,541 and $125,232. There was no public debt. The treaty of friendship with Italy was renewed in 1914 and 1920. Representatives of San Marino were to be found at London, Paris, Rome, and Barcelona. San Marino was technically at war with the Central Powers for her citizens were permitted to enlist in the Italian army.

SAN REMO CONFERENCE. See REPARATIONS.

SANTAYANA, GEORGE (1863–). An American philosopher of Spanish extraction (see VOL. XX). He resigned from the faculty of Harvard University in 1912, and lived thereafter in England and on the continent. He collaborated in 1920 with a group of other American philosophers in the publication of the *Essays on Critical Realism*. Here the attempt is made to save philosophy from mentalism and scepticism through the revival of the classic distinction of essence and existence, both notions conceived as independent of the knowing subject. In his subsequent development, Santayana seemed to move away even from such critical realism. His *Scepticism and Animal Faith* (1923) and his "Preface to a System of Philosophy (*Yale Review*, 1924) show him replacing the immutable and eternal Platonic essences with relativistic knowledge, postulated by human faith and according to human needs.

His other works since 1914 include *Character and Opinion in the United States* (1921), a collection of *Soliloquies in England* (1922) and a war book, *Egotism in German Philosophy* (1915).

SANTO DOMINGO (DOMINICAN REPUBLIC). A West Indian state occupying the eastern part of the island of Haiti. The area is estimated at 19,332 square miles. The population in 1923 was 708,000; by the census of 1921, it was put at 897,405. The city of Santo Domingo, the capital, had 30,957 inhabitants. Agriculture and cattle-raising continued the chief interests of the population. Sugar estates were to be found in the southern part of the country; tobacco, cacao, and coffee were grown in the other sections. Sugar production in 1922–23 totaled 206,272 tons. The cacao yield in 1922 was 19,000,000 kilos. There was a great variety of minerals, the chief being gold and silver, but few were worked In 1913 the total trade was valued at $19,741,000; in 1920 it reached the high figure of $105,257,117. In the succeeding years it declined, falling to $45,199,375 in 1921 and $29,548,852 in 1922. The year 1921 was the only one in the period to show an adverse trade balance for the republic The preponderating share of the country's foreign trade fell to the United States. Exports from Santo Domingo to the United States for 1920, 1921, and 1922 were respectively 87 per cent of the total, 77 per cent, and 42 per cent. The last figure was occasioned by the small purchases of Dominican sugar because of the tariff and prevailing low prices. Thus, while in 1921 the United States imported 80 per cent of the Dominican crop, in 1922 the purchase was only 25 per cent. The United Kingdom and Canada took the remainder. In 1921 and 1922, American imports into Santo Domingo totaled 84 and 72 per cent of the whole. Sugar and cacao continued the leading exports. There was no additional railway building over the period. However, an excellent macadam road was opened in 1922 from Santo Domingo on the south coast to Monte Christi on the north coast (182 miles). In 1923 a similar road from San Pedro de Macoris to the capital (47 miles) was completed. Revenues and expenditures for 1913–14 were $5,035,250 and $4,890,216; for 1922, $12,164,142 and $11,353,686. The bonded debt of the country, on Dec. 31, 1922, stood at $14,800,203. Within the period 1914–24, loans for $1,538,200 (1918) and $6,698,485 (1922) were raised. Defense was in the hands of a native constabulary of 1200 men and 114 officers. American marines, stationed in Santo Domingo

in 1924, numbered 1881 men and 105 officers.

History. The much-needed internal peace which was to result from the American-Dominican fiscal treaty of 1907 came to a premature end with the assassination of President Ramon Caceres in 1911. Thereafter each year saw a new revolution and a new president. President Bordas, who had been elected in April, 1913, encountered a strong rebellion in the spring of 1914. When the situation had become a hopeless tangle in the late summer, matters were straightened out with the assistance of an American commission which had been sent to Santo Domingo for this special purpose. Bordas was induced to resign and Dr. Ramon Baez, the son of a former president, was elected provisional president on Aug. 27, 1914. In October of the same year ex-President Juan Isidro Jiminez was chosen constitutional president For a brief time it seemed as if he would be able to ensure an era of peace and prosperity, but it soon became apparent that he was too aged and infirm to cope with the elements of corruption and disorder. A new revolution broke out under General Arias, a chronic revolutionist of Monte Christi, early in 1916. When Arias seemed on the point of seizing the government, the United States, which by this time had grown thoroughly impatient with the interminable civil disorders and their attendant destruction of life and property and harm to American and other foreign interests and had become alarmed by the danger of international complications, landed marines and took control in Santo Domingo. President Jiminez, who had approved American intervention but had become dismayed at the turn of affairs, resigned on May 6, 1916, and left the country, while General Arias was summarily ousted by the American commander. The complete pacification of the interior by the American forces was rapid and without serious opposition from the native population. On July 25, the Dominican Congress chose as temporary president Dr. Francisco Heriquez Carvajal, a man of outstanding ability and character. In view of the failure of the 1907 treaty to ensure peace and the security of property, the United States decided to exact guarantees against the recurrence of disorders in the future and hence made its recognition of Henriquez contingent on the conclusion of a new American-Dominican treaty modeled after the treaty signed between Haiti and the United States in 1915. The principal features of the new treaty were to be provisions for the collection of customs under American supervision, the appointment of an American financial adviser, and the installation of a constabulary force officered by Americans. On the refusal of President Henriquez to accede to this request, on the ground that the proposed treaty constituted a flagrant infringement of the sovereignty of the Dominican Republic, the American authorities proceeded to compel compliance by withholding all Dominican revenues from the government. This brought about complete paralysis of the whole governmental machinery. When it became apparent that President Henriquez intended to stand for reëlection at the expiration of his temporary term, with good prospects of success, the existing deadlock threatened to continue for an indefinite period. To end an impossible situation the American commander issued a proclamation declaring the Dominican Republic under the military administration of the United States. Immediately thereupon the military government took full possession of the country, and what little opposition there was met with rapid suppression.

During the American occupation, Santo Domingo enjoyed a wholesome quiet after the many years of internal disturbances, and a notable improvement was made in social and economic conditions. Most important among the many reforms were the construction of many miles of good roads, the enactment of new tax and revenue laws, the settlement of claims outstanding against the Dominican government, the creation of an efficient police force, the building of new schools, and the enforcement of strict sanitary regulations. Notwithstanding these obvious benefits, the Dominican people maintained their passive resistance and the spirit of resentment which they had manifested when they rallied around President Henriquez in 1916. Only the recognition of the utter futility of an armed conflict prevented them from offering armed resistance. No economic betterment could in their eyes offset the existence of the hateful occupation and the distasteful occurrences which went with it. The practical exclusion of the Dominicans from participation in the government, the overbearing conduct of many of the American military officers, the arbitrariness of the provost courts, reports of acts of cruelty and brutality on the part of American soldiers, all served to fan a spirit of violent resentment and opposition against the occupation. Off and on, loud protests were voiced by the Dominicans against American intervention and the very considerable loan which they were pressed to float.

Evacuation of the Dominican Republic by the American forces was foreshadowed by the proclamation issued by the military government on Dec. 28, 1920, stating that "the time has arrived when it (the military government) may, with a due sense of its responsibility to the people of the Dominican Republic, inaugurate the simple process of its rapid withdrawal from the responsibilities assumed in connection with Dominican affairs." At the same time it was announced that a commission of representative Dominicans with a technical adviser would be appointed to prepare the constitutional amendments and to revise the laws of the Republic and that these laws, after approval by the military government, would be submitted to a constituent assembly and to the national congress. On June 14 a similar proclamation was issued, outlining the conditions under which the withdrawal would be made After a long delay due to the refusal of the Dominicans to accept the American conditions, an American-Dominican accord was signed on June 30, 1922, which, aside from the establishment of a provisional government, stipulated that a treaty should be concluded between the United States and the new Dominican government, whereby the latter should recognize the validity of all acts of the American military government during the occupation, of the bond issues of 1918 and 1922, and of the convention of 1907, the latter to remain in effect for the time during which the 1918 and 1922 bond issues remained unpaid. Pending the establishment of a permanent government, Juan Bautista Vicini Burgos assumed office as provisional president on Oct. 21, 1922. Subsequently Gen. Horatio Vasquez, who was perhaps the outstanding figure in Dominican po-

litical life, was elected constitutional president. On June 26, 1924, the Dominican Congress ratified the treaty with the United States which provided for the withdrawal of the American forces, and simultaneously it was announced from Washington that the withdrawal would commence as soon as possible after July 10, 1924

SARAWAK. See STRAITS SETTLEMENTS.

SARAZEN, EUGENE (?-). Professional golf player. He learned the game as a caddy and in 1922 captured the American open championship and followed this up a few weeks later by carrying off the honors in the American professional championship. He successfully defended his professional title in 1923.

SARGENT, JOHN SINGER (1856–1925) An Anglo-American artist (see VOL. XX). His portrait of Henry James was one of the paintings attacked by the suffragettes in London in 1914. The third series of his mural decorations in the Boston Public Library, finished in 1916, was entitled "The Theme of the Madonna." He made several paintings of scenes on the western front during the War. His large picture, "Gassed," in the Royal Academy, attracted great attention. In November, 1921, his decorations in the rotunda of the Boston Museum of Fine Arts were unveiled.

SARRAIL, MAURICE (1856-). A French general (see VOL. XX). At the beginning of the War he commanded the 6th Corps, and on Sept. 2, 1914, he was appointed commander of the 3d Army. At Verdun, although authorized and even commanded to fall back, he held his army on the northwestern front, which helped to make Joffre's counterattack possible. He later became commander-in-chief of all the Allied forces in the East but was recalled to France in 1917, and in April, 1918, he was put on the reserve list as having reached the age limit. Soon after the end of the War he published an account of the Saloniki operations, under the title, *Mon Commandement en Orient.*

SARTORIUS VON WALTERSHAUSEN, AUGUST, BARON (1851-). A German economist (see VOL. XX). He published *Der Paragraph 11 des Frankfurter Friedens* (1915); *Weltwirtschaft und Weltkrieg* (1915); *Deutschland und die Weltwirtschaft nach dem Kriege* (1922); and continued his *Deutschlands Wirtschaftsgeschichte* from 1913 to 1920.

SASKATCHEWAN. A Canadian Province, with an area of 251,700 square miles, and a population in 1921 of 757,510. The latter was a gain of 265,078 or 53.8 per cent over the figures for 1911. Of the population in 1921, 538,552 (71 1 per cent) lived in rural districts and 218,958 in urban. In 1921, males numbered 413,700 and females 343,810. Settlers of American origin in 1916 numbered 87,907. There were considerable colonies of Germans, Austrians, Scandinavians, Russians, and Dutch. Populations of the larger towns in 1921 were: Regina, the capital, 34,432; Moose Jaw, 19,285; Saskatoon, 25,739; Prince Albert, 7558.

Industry. Because of the prairie nature of the country, agriculture was the leading occupation. By 1923 the acreage devoted to wheat had increased to 12,791,000 acres from the 5,720,000 acres in 1912. Saskatchewan was the leading wheat-producing Province. The acreage under oats, barley, rye, potatoes, also doubled at least during the period. As a result of the diversified farming practiced and the attention given to root crops, etc., the live stock industry thrived. In 1923 there were 403,813 milch cows (204,624 in 1914), 1,131,274 other cattle (474,436 in 1914), 137,240 sheep (126,027 in 1914), 679,867 swine (454,703 in 1914). The value of agricultural products for 1923 was $291,439,000, as follows: field crops, $248,778,000; dairy products, $19,366,000 (compare the 1910 product of $381,809); wool clip, $142,000; game and furs, $7000; garden products, $2,461,000; poultry and products, $8,670,000. Under the spur of an enlightened self-interest, farmer organizations applied themselves to coöperative grazing schemes and cooperative elevators. In 1922, 332 elevators handled a total of 37,335,337 bushels of all grains. The extensiveness of the idea may be gained from the fact that shares in these enterprises were held by 23,014 persons. Other industries yielded: fish catch (1921), $243,018; coal, (1922) $802,053 In 1921, there were 2027 industrial establishments, concerning themselves primarily with milling and building operations, capitalized at $34,794,506 and adding to products by manufacture, $20,723,666. Employees numbered 7235; salaries and wages paid, $8,842,286. The water-power resources were estimated at 513,481 horse power but by 1922 practically none of this had been utilized.

Trade and Communications. Animal products and grains were the Province's leading exports. Exports for 1922–23 amounted to $12,777,000; imports, $10,716,000. In 1922 there were 6267 miles of railway in operation as compared with 5654 miles in 1914.

Government. Revenues for 1921–22 totaled $11,801,894 as compared with $4,668,754 in 1913; expenditures for 1913 and 1921–22 were $4,656,800 and $13,322,119. In 1922, in the 4543 elementary and secondary schools, 183,935 pupils were enrolled (99,109 pupils in 1913). High schools were attended by 5627 pupils. Total expenditures for education in 1913, $8,787,904; in 1921, $15,612,331. The provincial representation in the Dominion Senate was increased to six members. For 1920–21, receipts from the Dominion government (subsidy and school lands) amounted to $3,088,646. Women received the franchise in 1916 and were made eligible for election to the provincial legislature.

SATELLITES. See ASTRONOMY.

SATIE, ERIK (1866–1925). A French composer, born at Honfleur, France. Although he received musical instruction from the age of eight, and had good teachers, he neglected his opportunities. After leaving the Paris Conservatory, where he was regarded as hopeless, he played in various cabarets in Montmartre until about 1890 He then met Josephin Péladan, a writer and leader of a mystic cult, the Salon de la Rose-Croix, which he joined in 1892. The next two years he spent writing incidental music for the plays of Péladan and other members of the salon, and thus began to realize the inadequacy of his technical equipment. He entered the Schola Cantorum, and nothing was heard of him until 1911, when Ravel played some of his piano pieces. Satie began as an extreme impressionist and rapidly drifted into Futurism. He wrote mainly for piano, his works being as eccentric and extravagant as their titles (e.g. *Aperçues Désagréables, En Forme de Poire, Pièces Froides,* etc.). He also wrote two ballets, *Upsud* and *Quadrille.*

SAULT SAINTE MARIE, CANALS AT. In

1914 the United States St. Mary's Falls Canal had its facilities increased by the completion of a third lock, known as the Davis lock, which was opened to commerce on October 21. This lock was 1350 feet in length between gates, with a usable length of 1300 feet, and had a width of 80 feet and a minimum depth of 24.5 feet over the sill. This lock was a part of a new separate canal on the American side with a width of 200 to 300 feet and by its increased depth made it unnecessary for the heaviest draft vessels to use the Canadian canal as was previously sometimes required, for there was only about 18½ feet at low water through the Poe or second American lock. The new canal was crossed by a long bascule bridge carrying a railway track. Another feature of this canal was a fourth lock, of the same dimensions as the third. This fourth or Sabin lock, named for the general manager of the canal, L. C. Sabin, was completed after various delays due to the War and opened to traffic on Sept. 18, 1919. It is operated by electricity and but 8 minutes are required to raise or lower the craft in the lock a distance of 20 feet Two of the largest lake freighters can be accommodated tandem on these long locks. In 1916 a record was made of 25,407 vessels with a registered net tonnage of 69,824,463 passing through the American and Canadian canals with a total of 91,888,219 tons of freight. This record can be compared with the statistics for 1923 when 21,975 vessels passed through the canals with a net tonnage of 68,546,412 and 91,379,658 tons of freight.

SAUVEUR, ALBERT (1863–). An American metallurgist (see VOL. XX). He was metallurgist attached to the American Aviation Commission in France during 1917–19 and was appointed metallurgical expert to the French Ministry of Munitions in 1917.

SAVOY, UPPER See SWITZERLAND.

SAWYER, ROLAND DOUGLAS (1874–). An American clergyman, born at Kensington, N. H., and educated at Boston University. Besides his ministerial duties, he conducted a crusade against profanity during 1902–07, and organized the Anti-Profanity League. He was also active in Socialist politics, lectured for the Socialist party, and was Socialist candidate for governor of Massachusetts in 1912 He was elected to the Massachusetts Legislature on the Democratic ticket in 1914 and was reëlected till 1921. His writings include: *The Making of a Socialist* (1911); *Social Science of Jesus* (1912); *Walt Whitman, the Prophet Poet* (1913); *'Neath Swaying Pines* (1916); *Thoreau, New England Philosopher* (1917); *The Great Teachers of Wisdom and Virtue* (1920); etc.

SAWYER, RUTH (MRS. ALBERT C. DURAND) (1880–). An American author, born at Boston, and educated at Columbia University. In 1908 she began professional story telling and later wrote short stories, particularly Irish folk tales. She wrote: *The Primrose Ring* (1915); *Seven Miles to Arden* (1916); *Myself* (1917); *A Child's Year Book* (1917); *Doctor Danny* (1918); *Leerie* (1920); *The Silver Sixpence* (1921); *Gladiola Murphy* (1923); *Tale of the Enchanted Bunnies* (1923).

SAXONY. The internal situation in Saxony remained comparatively calm during the first years of the War. In 1917, however, it assumed a disquieting aspect, and a strong movement for internal reform and an early peace began. It accumulated force during the following year and brought about the fall of the government in October, 1918. The career of the succeeding government, the Heinze ministry, was cut short by the November revolution, in the course of which King Friedrich August abdicated and a republic was proclaimed. During the confusion of the early revolutionary period, the government was in the hands of People's Commissioners representing the extreme Socialists, but after the disturbances and upheavals of January, 1919, the reins of government were taken over by the Majority Socialists. The radicals in the country, which long before had earned for itself the sobriquet of "Red Saxony," were not willing, however, to relinquish the realization of their dreams without a serious struggle. New risings took place and after a series of sanguinary conflicts a Soviet republic was declared in Leipzig during April, 1919, which was crushed by the Reichswehr during the following month. Thereupon Saxony entered into a more peaceful period until the Kapp Putsch, which threw the country once more into violent disorder. Serious communist risings occurred throughout Saxony and especially in the Vogtland, where the communist bandit, Max Hölz, ruled for a while in a Robin Hood manner. Again the Reichswehr had to be called in to reestablish the authority of the Dresden government. At this time the ministry, consisting, since October, 1919, of a coalition of Majority Socialists and Democrats, was replaced by a coalition of the two Socialist parties A new constitution was adopted on Oct. 26, 1920, and in accordance with its provisions elections for the Diet were held during the following month, which cut the representation of the Majority Socialists by nearly one-half The Majority Socialists obtained only 27 seats against 47 for the bourgeois parties but the combined popular vote for the former two Socialist parties was 1,029,083 against 1,011,108 for the bourgeois groups. In consequence of their increased representation, the latter were able to maintain a vigorous parliamentary opposition against the Socialist government.

After a period of comparative calm in 1921 and 1922, "Red Saxony" came once more into the limelight in the fall of 1923, at a time when the Reich was in a very critical situation and reaction and monarchism were rampant in the neighboring state of Bavaria Ostensibly as a counter-movement against the peril of Bavarian nationalism, the Socialists received avowed communists into the cabinet and "Proletarian Hundreds" were organized to fight reaction and to spread revolutionary terror. This action soon brought the Saxon Prime Minister, Dr. Zeigner, into conflict with the Reichswehr and the Minister of National Defense for the Reich. When the Saxon Minister of Finance, Dr. Böttcher, who was an out and out communist, called on the "Proletarian Hundreds" to arm, the government of the Reich decided to take action. The commander of the Reichswehr in Saxony demanded from Dr. Zeigner the dismissal of the communist ministers and the submission of Saxony to the authority of the Reich. Upon the refusal of the Saxon Premier to comply with these demands the Reichswehr marched into Saxony on Oct. 22, 1923, and the whole Zeigner ministry was dismissed. The central government installed thereupon a moderate So-

cialist ministry. Dr. Zeigner was subsequently brought to trial for private offenses committed while in office.

The result of the suppression of radical socialism in "Red Saxony" was on the one hand a consolidation of the communist elements and on the other the discrediting of moderate socialism and a considerable shift to the Right. In the municipal elections of Jan. 13, 1924, the Social Democrats suffered defeat at the hands of the bourgeois parties In the course of 1924, the internal situation in Saxony, as elsewhere in the Reich, improved materially, notwithstanding the serious lockouts in Chemnitz and Zwickau in the early summer, which were part of an extended conflict in the Reich between employers and workers over the lengthening of work hours.

SAYLER, OLIVER MARTIN (1887–). An American dramatic critic born in Huntington, Ind. He was graduated from Oberlin College, Ohio, in 1909, and during 1909–20 worked on the *Indianapolis News* After 1915 he was correspondent for the *Boston Evening Transcript*. He studied the theatres of Europe and gave extended lectures on Russia and on the theatre. He is the author of *Russia, White or Red* (1919); *The Russian Theatre under the Revolution* (1920); *Our American Theatre*, a comprehensive study of the condition of the theatre in the United States viewed from the standpoint of producer, actor, audience, and stage technician

SAZONOV, SERGIUS DMITRIEVITCH (1866–). A Russian statesman. He was educated at the Alexandrovsky Lycee, and although convinced of the necessity of reforms, he nevertheless supported the old order. His first diplomatic post was that of Counselor of the Embassy in London, where he assisted Count Benckendorff in cementing friendship between his country and Great Britain. Afterward he was Russian Minister at the Vatican and later Minister of Foreign Affairs in St. Petersburg, at a time when Russia was disentangling herself from the aggressive policy of Germany. Sazonov showed patience, skill, and firmness in resisting German pressure without giving offense, at the same time strengthening the bonds uniting Russia and Great Britain. With the Czar he did his utmost to avert the War, but when it came he proved loyal throughout to the Entente cause. He opposed assumption of the army command by the Czar and also sought to placate the Poles by home rule. This last measure was countermanded, and Sazonov was dismissed After the revolution of March, 1917, it was planned to send him to London to represent the provisional government, but the fall of Milyukov defeated the project. Kolchak made him minister of foreign affairs, and he made an unsuccessful trip to London to win recognition of Russia.

SCANDINAVIAN LITERATURE. Danish. Jóhann Sigurjónsson, who died in 1919, held the foremost rank among twentieth century Danish-Icelandic dramatists His plays, based on Icelandic history and legend, show a strong love for Icelandic nature and Icelandic character, both of saga and contemporary times. Henri Nathansen was generally considered the greatest Danish dramatist of the day. One of his favorite themes is the contrast between Jew and Gentile. Einar Christiansen writes somewhat in the manner of Ibsen. Like Otto Benzon, he often portrays the conflict between the old and the new.

Among the poets, Ludvig Holstein, although a lyricist, usually conceals his own personality. His poetry often expresses a love for nature, particularly spring. Johannes Jorgensen was considered by some the greatest living Danish poet. A Catholic convert, he gives expression in his poetry as well as in his prose to his soul experiences and religious sentiments. L. C. Nielsen was attempting to create a modern national poetry. He is the writer of a number of cantatas of great power and is the interpreter of the lonely, the wanderer, and the lover. In the poetry of Kai Hoffmann is seen a love for life and for everything living. Olaf Hansen's is largely poetry of reminiscence Other poets of note are Sophus Claussen and Thøger Larsen.

Danish fiction suffered a great loss in the death of Jakob Knudsen in 1917. Johannes V. Jensen was one of the foremost writers of Denmark. Influenced at times by Walt Whitman, and a strong believer in the soundness of northern life and tradition, Jensen became interested in a Gothic renaissance In his later works (*Brœen, Norne-Gœst, Kongens Fald*), he pictures Danish life, particularly from Viking times. Otto Rung is characterized by his clear and firm thinking, his original interpretation of human nature, his thrilling action, and his subtle psychology. A writer touching on social conditions is Henrik Pontoppidan. He does not preach; yet his sympathies are clearly with the under class. His series, *De Dødes Rigs*, beginning with *Torben og Jytte* and ending with *Favsingholm*, portrays different phases of the struggle between the people and their oppressors. Martin Andersen Nexø is another writer interested in social problems. Among his later works may be mentioned *Ditte Menneskebarn*, a series treating the history of a family and constructed on large lines, and *Pelle Eroberen*, the story of a poor boy who grows up to be a leader of the workingmen. More strongly felt are the tendencies toward preaching a social gospel in the works of Jeppe Aakjær, whose *Hoor der er Gœrende Kræfter* may be interpreted as warning the leisure class against a possible rebellion of the peasants. In *Jens Langkniv*, Aakjær tries to portray in a single village the general history of Denmark. His stories usually centre around a character, a cause, or a view of life. Karl Gjellerup, who died in 1919, was originally a theologian and then went over to a rationalistic view of life, to end up with an ethical-religious philosophy In his novels, Gjellerup's learning often seems oppressive and distracts from his story. His *Den Gyldne Gren* depicts the conflict between heathendom and Christianity. Kund Hjortø finds his strength in his keen perceptions as a philologian and a psychologist. Of his later works may be mentioned the novels *Fru Herba* and *Tvelys*, and the collection of short stories, *Ud for Skrænten*. Of the Icelandic immigrants writing in Danish, the most important is Gunnar Gunnarsson, who shows vividly the disharmony, the gloom, and the passion of the soul-life of the Icelander, and also his lighter mood Among his works are the series *Borgslægten Varg i Veum, Edbrødre*, which goes back to early times, and *Salige er de Enfoldige*.

In linguistics, Otto Jespersen held a prominent place not only in Denmark but in the

world. In the field of literary criticism should be mentioned Georg Brandes, who in addition to Scandinavian has treated other literatures, ancient as well as modern; Vilhelm Andersen; and Valdemar Vedel.

Norwegian. Gunnar Heiberg was considered the greatest Norwegian dramatist of the period. His strength lies in the portrayal of strong sentiments and feelings. Another outstanding playwright was Hans E. Kinck. The drama also received contributions from others whose chief work lies outside this field, such as Herman Vildenvey, Nils Kjær, Vilhelm Krag, and Johan Bojer.

Norwegian poetry, even when written in Landsmaal, has retained many of the Danish characteristics and in general shows foreign influence. In spite, however, of its lack of a distinctly national character, it is very strong. In the period under review, foremost among lyric poets stood Olaf Bull, who expresses feelings for nature and love with exquisite tenderness, and Nils Collett Vogt, who is strongly subjective and whose *Hjemkomst* is his ripest and deepest poetry. Other noted lyricists were Vilhelm Krag, the representative of neoromanticism, and Knut Hamsun, whose main field, however, is the novel Herman Vildenvey owed his popularity to his roguish humor. Among poets writing in Landsmaal were Olaf Ankrust, whose *Himmelvarden* is one of the best poems in Landsmaal literature, and Kristoffer Uppdal, who comes nearest to writing a national poetry and whose verse in general is free from the Danish characteristics noted above.

Hans E. Kinck was regarded by some as the most important living Norwegian author. At heart a romanticist, he is yet interested in the world of reality and its problems. In the field of fiction, his *Sneskaflen Brast*, a novel built on very broad lines and strong in social psychology, is an epoch-making work. Nils Collett Vogt, besides being a novelist, is a dramatist and a poet. Johan Bojer, whose *Den Store Hunger* made him known internationally, upholds idealism against materialism and generally shows the victory of optimism over pessimism. Another novelist known outside of Norway is Knut Hamsun, whose *Markens Grøde*, expressing the dream of an ideal state in nature, seems a reaction against the War. The best-known woman writer of the period was Sigrid Undset, whose *Kristin Lavransdatter* gives in three volumes the story from childhood to death of a fourteenth century girl. Sigrid Undset is particularly interested in the problems of her own sex. The same is true of Barbra Ring, author of *Før Kuldenkommer*, *Under Sejl*, *Søstre*, etc., who treats woman's side of married life and evinces a love for the soil and the agrarian class. Kristian Elster, in his works *Landeveien*, *Ilden*, *Guldet og de Grønne Skoger*, etc., protests against existing conditions and the prevailing philosophy of life. Among prominent novelists should also be mentioned Gabriel Scott and Johan Fredrik Vinsnes. Of Landsmaal writers we may note Arne Garborg, also a poet, the leader of the Landsmaal movement; Oskar Braaten, who is particularly interested in life among the poorer classes; Kristoffer Uppdal, who even in his prose evinces strongly lyric tendencies; and Olaf Duun, who shows an intimate knowledge of peasant life.

Halvdan Koht is a scholarly writer on historical and literary subjects. Among literary critics should be mentioned Gerhard Gran, the editor of *Edda*, founded in 1914; Christen Collin, and Fredrik Paasche.

Swedish. The Swedish drama was not very strong during this period The theatre drew largely on foreign and earlier Swedish plays. Among the best contemporary dramatists were Tor Hedberg, who also excelled in other fields of literature, and Per Hallström.

The greatest living Swedish poet was Verner von Heidenstam. He is an idealist, fond of portraying the conflict between good and evil and interested in Swedish history and its heroes. Through his poetry breathes the spirit of patriotism, which is, however, largely an extension of his love for his birthplace. In addition to being a poet, Heidenstam wrote several novels, particularly on historical subjects; these antedated 1914. Matts Magni Granström at times shows the influence of Runeberg. He emphasizes the spiritual and touches on the relation between the subjective and the objective and on man's intimate connection with nature. Among his works may be mentioned *Visor i Byn* and *Hat och Karlek*. Daniel Fallström is a writer of love-lyrics; he also describes nature, particularly the surroundings of Stockholm. Swedish lyric poetry was strongly represented in Finland In this connection four men were outstanding. Preeminent among these was Bertel Gripenberg, a portrayer of strong feelings, hate as well as love. His verses are full of the spirit of fight Among his later works we may mention the collection *Under Fanan*, written under the inspiration of the civil war in Finland. Jacob Tegengren is deeply sensitive to nature, particularly to its spring and summer. He is quiet and dreamy, the melancholy of his earlier years having given way to a more joyful tone. Among his later poems may be noted "Ny vår." Arvid Mörne's poetry is often inspired by a love for his native place, its nature, and its people. But Mörne is also an agitator, fighting now for this cause, now for that, this often gives his poetry an argumentative coloring. He has also shown ability in the drama and novel. Hjalmar Procopé, the last of the Swedish writers in Finland to be mentioned here, has no definite philosophy of life His poetry is quiet and characterized by a mild and manly resignation.

The author who was considered by most critics the greatest living writer of Swedish fiction was Hjalmar Söderberg. The chief strain running through his works is pessimism. His irony and wit as well as certain features of his technique show French influence. Next in rank is Per Hallström, also a dramatist, whose works show a very strong power of imagination and keen psychological insight. Selma Lagerlöf is an extremely popular author, well known also outside of Sweden. Her work is characterized by a rich imagination, a love for her native province of Värmland, a strong power of story-telling, and a wholesome moral tone. Best known of her works is *Gösta Berlings Saga;* of her later works we may mention *Kejsaren av Portugallien*, *Bannlyst*, and *Mårbacka*. K. G. Ossiannilsson, who is also a poet, is interested in the problems of society, particularly in class struggles. Marika Stjernstedt is interested in her own sex, especially in the strong, independent woman placed in contrast with her weak

and submissive sister. Some of her late books are *Aventyrensland; En Officershistoria; Varlden och Stjarnorna*, picturing the attainment of peace through struggle; and *Bakom Disken*. Pär Lagerkvist is an author whose place has not yet been determined. He leans somewhat toward impressionism, is strongly original, and has a very productive imagination. Among his late books may be mentioned *Det Eviga Leendet* and *Den Lyckligesvag*. Martin Koch is a writer with a social message. He shows strong sympathy for the lower classes, whose lives he likes to depict, as seen in *Guds Vackra Varld* and *Anteckningar På Havet*. In religion he favors an everyday practical faith rather than dogmatism and formalism. Elin Wägner generally has a thesis in her works, although in her later books she leans somewhat to the novel of character. Among these later works are *Helga Wisbeck, Lakare; Den Befriade Karlchen*, and *Den Namnlosa*, the last-named showing the influence of Strindberg and Dostoyevsky. Henning Berger is especially fond of the emigrant to America whom he treats in several of his stories. His characters usually have something of the legendary, and in general his novels are permeated by a note of earnestness and melancholy. Tor Hedberg is one of the strong writers, not only of fiction but also of drama, poetry, and criticism. Sven Lidman is interested in memories and traditions. Of his later works may be mentioned *Huset med de Gamla Froknarna* and *Såsom Genom Eld*. Among humorists should be mentioned Albert Engström, whose humor and keen understanding of Swedish character made him a favorite with the people, and Hjalmar Bergman, whose *Markurells i Wadkoping* carried him to the height of popularity.

Nathan Söderblom, the archbishop of Sweden, contributed to the subject of religion, its origin, development, etc. Adolf Noreen had become internationally known for his linguistic investigations. Among literary critics were Henrik Schück, Karl Warburg, John Landquist, and Fredrik Böök.

SCAPA FLOW. A small body of water nearly enclosed by the Orkney Islands, about 14 miles long varying from 3 to 8 miles in width. The principal channels leading out are through Hoy Sound into the Atlantic Ocean and through Holm Sound into the North Sea. Each is about 2 miles wide. The best anchorage is on the north coast of Hoy, but there are several others. Scapa is over 50 miles farther from the German coast than Rosyth (q.v.), but the great ease of entrance and exit for a large fleet caused its use during the War as the operating base of the British Grand Fleet. It was in Scapa Flow that the surrendered German fleet was interned and where it was scuttled by its officers. See WAR IN EUROPE, *Naval Operations*.

SCARBOROUGH, GEORGE MOORE (1875–). An American playwright, born at Mt. Carmel, Texas, and educated at the University of Texas. From 1897 to 1905 he practiced law in Texas, then became a reporter for the New York *American*, and was with the Department of Justice from 1909 to 1914. His first play, *The Lure* (1913), attracted much attention. Among his other plays are: *At Bay* (1913); *The Court of Last Resort* (1913); *What Is Love?* (1914); *The Heart of Wetona* (1916); *Moonlight and Honeysuckle* (1918); *The Son-Daughter* (1919); *Bluebonnet* (1920); *The Mad Dog* (1921); *Mrs. Hope's Husband* (1921); *The Grail* (1922).

SCARLET FEVER. In 1923 and 1924 more was learned of the intimate nature of this disease than within the previous 50 years. During that period it had been taught that scarlet fever per se is not a severe disease but that it paves the way for secondary infections with the streptococcus. These complications are responsible for the wave of deafness, kidney disease, etc., that follows it. But the labors of independently active researchers—Dick and Dick; Dochez, Sherman, and Blake; and Trask and Lynch—which were published in 1923 and 1924 in the *Journal of the American Association*, all point to the same conclusions. Scarlet fever is due solely to a special strain of the hemolytic streptococcus, which flourishes only in the tissues of scarlet fever patients and possibly in so-called immune carriers. This organism is the cause alike of the disease and of its destructive complications. From first to last its pathogenesis shows the same nature and largely the same manifestations as diphtheria, which so closely resembles it in its clinical expression. This indicates that the disease is largely the result of an intoxication by the secretions arising from the bacterium, so that scarlet fever takes its place with those affections which can be reached by an antitoxin. Other members of the group to date comprise diphtheria, tetanus, botulism, one form of anthrax, etc. From analogy it should be possible to recognize those predisposed to the disease, to immunize against it, and to cure patients already infected, provided the antitoxin can be used seasonably. The conditions have been realized perfectly in the laboratory and in experimental work on volunteers, but application in daily ordinary practice will require several years

SCHÄFER, DIETRICH (1845–). A German author and historian (see VOL. XX). Like most of the historians of his country, after 1914 he wrote only works dealing with the War and the problems of Germany. They include: *Sein oder Nichtsein* (1914); *Deutschland und Frankreich* (1914); *Das Deutsche Volk und der Osten* (1915); *Staat und Volk* (1915). *Deutschland und England in See-und Weltgeltung* (1915); *Die Kultur und Ihre Aufgaben* (1917); *Die Vereinigten Staaten als Weltmacht* (1917); *Russland* (1918); *Wir Deutschen als Volk* (1918); *Die Schuld am Kriege* (1919); *Die Schuld an der Wiedergeburt Polens* (1919).

SCHEIDEMANN, PHILIPP (1865–). A German Socialist leader, born at Kassel. After attending the Burgerschule and the Realschule of his native town, he learned the printer's trade, and later became editor of a Socialist paper at Giessen and then of others at Nürnburg, Offenbach, and Kassel. In 1903 he was elected to the Reichstag, representing Solingen, and became a leader of the Social-Democratic party. He supported the government in its war policy, which greatly displeased the Minority or Independent Socialists. In 1918 he was elected vice president of the Reichstag and was made secretary of state without portfolio in October of that year. His party was said to have been willing that the monarchical form of government should be continued in Germany under a regency, but the Independent Socialists were determined on a republic; and their efforts were so successful that they were admitted in equal numbers in the provisional government,

They denounced Scheidemann for his willingness to retain the services of reactionary officers and troops for the suppression of Communist disorders. When the National Constituent Assembly met at Weimar on Feb 6, 1919, he was elected vice president of the Republic. After guiding the new government through the troubles of the first half of 1919, he resigned on July 20, as he could not agree to the signing of the Treaty of Versailles. He took up again the leadership of the Majority Socialists in the National Assembly and afterward in the republican Reichstag. In 1920 he was elected chief burgomaster in his native town.

SCHELDT RIVER CONTROVERSY. See NETHERLANDS

SCHEPPEGRELL, WILLIAM (1860–). An American laryngologist and one of the world's authorities on hay fever. Born in Hanover, Germany, he was educated in the State College of South Carolina and after taking a medical degree settled in New Orleans in 1890, devoting himself to the ear, nose and throat. He began to write on hay fever in 1909 and published many articles on the subject, some of them in the United States Government *Bulletins* (United States Public Health and Service). He was for some years president of the Hay Fever Prevention Society, and has made numerous additions to the armamentarium of his special work, notably in connection with the use of electricity His major writings are *Electricity in the Diagnosis and Treatment of Diseases of the Nose, Throat and Ear* (1898) and *Hay Fever and Asthma* (1922).

SCHICK, BELA (?–). A Hungarian bacteriologist and pediatrist known for his discovery of the special reaction to diphtheria toxin of children who are susceptible to the disease, which is now in general use throughout the civilized world by health officers He also discovered the existence of a peculiar toxic substance in menstruating women termed by him menotoxin. Schick was formerly an assistant to the well-known Vienna pediatrists Escherich and von Pirquet He has made numerous valuable contributions to periodical literature, but his major works are limited to *Scharlach* (Escherich and Schick) in 1912 and *Die Serumkrankheit* (von Pirquet and Schick) in 1905

SCHICK TEST. See DIPHTHERIA.

SCHINDLER, KURT (1882–). An American choral conductor, born in Berlin, Germany. He was trained in Berlin under K. Ansorge (piano), L Bussler, and F Gernsheim (composition), and studied under L. Thuille in Munich. From 1902 to 1903, he was conductor at the opera in Stuttgart, later in Würzburg, and from 1905 to 1907, was assistant conductor at the Metropolitan Opera House. In 1907, he became reader and critical adviser for G Schirmer In 1908, he founded in New York the MacDowell Chorus, which in 1910 became the Schola Cantorum This organization introduced many important novelties. Schindler is considered a specialist on folk music, of which he published several collections. His original compositions consist of about 50 songs and a choral ballad, *The Miracle of St. Raymond.*

SCHLATTER, ADOLF VON (1852–) A German theologian and author (see VOL. XX). His recent publications include: *Die Christliche Ethik* (1914); *Die Korinthische Theologie* (1914); *Die Martyrer in den Anfangen der Kirche* (1915); *Die Beiden Schwerter* (1916); *Luthers Deutung der Romerbriefe* (1917); *Die Entstehung der Beitrage zur Förderung der Christlichen Kultur* (1920).

SCHLESINGER, ARTHUR MEIER (1888–). An American educator, born at Xenia, Ohio. He was graduated from the Ohio State University in 1900 and took postgraduate courses at Columbia. From 1911 to 1919, he was professor and assistant professor of history at Ohio State University, and in 1919 became professor of history and head of the department of the State University of Iowa. He was a member of many historical societies and wrote (with H C. Hockett) *A Syllabus of United States History* (1915); *The Colonial Merchants and the American Revolution, 1763–1776* (1918), *Salmon Portland Chase* (1919); *New Viewpoints in American History* (1921). Professor Schlesinger edited *Great Charters of Americanism* (1920), and was also editor of the State of Iowa *Studies in Social Science*

SCHLESWIG. This small duchy (area, 3385 square miles), wrested from Denmark by Prussia and Austria in the war of 1864 and annexed by Prussia in 1866, was one of the stakes of diplomacy at the Peace Conference of 1919. Despite the programme of Germanization which Prussian officialdom had energetically pushed, about one-third of its 474,355 inhabitants at the outbreak of the War still spoke Danish. However, resistance to German rule in the period before and during the War had hardly been of an aggressive character. Schleswigers fought in the German army; Denmark was reluctant to estrange her powerful neighbor to the south by requests for territorial readjustment But the defeat of Germany and the triumph of the new democratic principles at once changed the complexion of affairs. The German government, anticipating a Danish appeal to the doctrine of self-determination, offered a separate arrangement for North Schleswig But Denmark procrastinated, the general dread of a resurrected Germany, together with the divided councils at home, standing in the way of a clear-cut pronouncement of aims. Finally, on Feb. 21, 1919, the Danish government placed the question of Schleswig before the Peace Conference. In the draft treaty submitted to the Germans in May, provision was made for the taking of a plebiscite in three zones, the third of which extended as far south as the Eider and the Schlei and was peopled largely by Germans whose social and cultural ties were clearly with the south While the Germans naturally objected to the inclusion of this southern region in the plebiscite area, it was the weight of the arguments of the Danish Radical party that succeeded in eliminating the third zone from the final treaty. Danes pointed out that the Germans in this district might be favorably disposed toward union with Denmark for economic reasons, viz., to escape heavy war taxes and the share of reparations, and that such a move would leave Denmark with a new irredentism Articles 109–14 therefore mapped out two plebiscite zones: the northern running south of Tönder but north of Flensburg, and the southern taking in the area about Flensburg. Voting in the first zone on Feb 10, 1920, gave a clear-cut majority for the Danes, 75,431 ballots being cast for Denmark and 25,329 for Germany. Tönder, in particular, being the centre of a Frisian population, gave a majority for Germany. Voting in the second zone took place

on Mar. 14, 1920. Flensburg, (population 63,000) the chief point of contention, was the scene of frequent clashes between the inhabitants and the French troops of occupation, and there were other disturbances. The final returns showed that 51,820 votes had been cast for Germany and only 12,793 for Denmark Flensburg went German by three to one. In June, 1920, the Council of Ambassadors fixed the boundary between Denmark and Germany and details were settled in the next month by treaty between the two countries. Into North Schleswig (Danish, Slesvig) the Danish currency was immediately introduced, and work was begun on the reconstruction of highways and railroads. Questions of the rehabilitation of war veterans, the protection of German minorities (of whom there were 25,000 in the province), frontier arrangements were amicably settled by treaty with Germany in 1922 Denmark assumed North Schleswig's share of the German reparation debt and under the Peace Treaty was obliged to pay 65,000,000 gold marks ($15,500,000) to the reparation account for the properties of the Prussian state which had passed into her control. A loan floated in the United States made the payment immediately possible. Danish Slesvig has an area of 1538 square miles and a population (census of 1921) of 163,622. By its acquisition Denmark's area was increased by about 10 per cent and its population by 5 per cent. A certain amount of German sentiment in the region was reflected in the fact that in the elections of 1920 and 1924 a German was returned to the Danish Folketing from Slesvig.

SCHMIDT, OTTO ERNST (pseudonym, OTTO ERNST) (1862–). A German Author (see VOL. XX). He wrote novels, plays and essays, of which the later ones include: *Nietzsche, der Falsche Prophet* (1914); *Gewittersegen* (1915); *Semper der Mann*, a novel which continues the story of his hero, *Semper der Jungling; Das Gluck ist immer da* (1916); *August Gutbier*, a satirical novel (1917); *Wer tötet Seine Mutter?* (1918); *Mann der Arbeit, Aufgewacht!* (1918); *Friede-Freude* (1920).

SCHMITT, FLORENT (1870–). A French composer, born at Blâmont, France. He began his musical studies at the Conservatory in Nancy, and in 1889–96 was at the Paris Conservatory, a pupil of Dubois, Lavignac, Fauré and Massenet. In 1897, he won the second Prix de Rome, and in 1900 the first prize. From 1906 to 1921 he lived in Paris, and devoted his entire time to composition. In 1921, he became director of the Conservatory at Lyons Although one of the foremost of impressionist composers, he does not sacrifice definite formal structure to mere atmosphere He wrote an opera, *Antony et Cléopâtre* (Paris, 1920); three ballets, *La Tragédie de Salomé* (Paris, 1907), *Ourvaçi* (unproduced), and *La Petite Elfe Ferme l'Œil* (Paris, 1922); the symphonic poems *Le Palais Hanté, Sélamik* (for military band), *Combat de Raksasas et Délivrance de Sita* (manuscript lost in the Paris flood of 1910), and *Rêves; for orchestra, En Eté, Reflets d'Allemagne, Pupazzi*, and *Rapsodie Viennoise;* vocal with orchestra, *Sémiramis* (lyric scene), *Psalm 46, Chansons à Quatres Voix, Pendant la Tempête, Danse des Devadasis;* a considerable amount of chamber music; and fine works for piano (solo, four hands, and two pianos).

SCHNABEL, ARTUR (1882–). An Austrian pianist, born at Lipnik, Carinthia. After receiving his first instruction from H. Schmitt he studied with Leschetizky in Vienna (1888–97). After that time he made constant tours, chiefly of Austria and Germany. He visited the United States for the first time in 1921. In 1912, he made his home in Berlin, where he formed a trio with A. Wittenberg (violin) and A. Hekking ('cello), and also appeared frequently as assisting artist with other chamber-music organizations. His joint recitals with Karl Flesch have for years been among the notable events of the Berlin musical season. As an eloquent interpreter of the classic and romantic masters he is unsurpassed, while as a composer, beginning as a mild impressionist, he gradually drifted toward extreme futurism. In his latest piano pieces, written after the War, he discards tonality, key-signatures, time-signatures and bar-lines.

SCHNEIDER, ALBERT (1863–). An American bacteriologist and pharmacologist, born at Granville, Ill. Having graduated in medicine at the College of Physicians and Surgeons, Chicago, in 1887, he settled in California and in 1903 began to teach bacteriology, pharmacognosy and therapeutics in the university of that State, resigning in 1919 to assume the professorship of pharmacognosy in the College of Pharmacy at the University of Nebraska. While in California he also took charge of the experimental station of the Spreckles Sugar Company (1906–07); was at the head of the department of pharmacognosy of the United States Department of Agriculture (1909–15) and was microanalyst of the State food and drug laboratory (1915–19). His chief publications are: *Pharmaceutical Bacteriology* (1912); *Pharmacal Plants and Their Culture* (1912); *Microbiology and Microanalysis of Foods* (1920); *Microanalysis of Powdered Vegetable Drugs* (1921).

SCHNEIDER, EDWARD CHRISTIAN (1874–). An American physiologist born at Wapello, Iowa. He was educated at Tabor College (B.S., 1897) and at Yale (Ph.D., 1901). He was instructor in chemistry at Tabor (1897–99); professor of biology and physical chemistry (1901–03), and professor of biology (1903–19) at Colorado College; and professor of biology (1919–) at Wesleyan University. He was physiologist in the medical research laboratory at Mitchel Field Air Service (1919–). Professor Schneider did important work on the influence of high altitudes on man in connection with the aviation service.

SCHNITZLER, ARTHUR (1862–). An Austrian dramatist (see VOL. XX). During the War and after it, many of his plays were translated into English and published in the United States, where they aroused much interest. *The Lonely Way*, translated in 1915, was highly considered. Other works made available to English readers were: *The Hour of Recognition, a Comedy of Words* (1916); *Casanova's Homecoming* (1922); *Gallant Cassian*, (a puppet play 1922); *The Shepherd's Pipe, and Other Plays* (1922); *The Vast Domain* (1922); *Living Hours* (1923).

SCHOFIELD, WALTER ELMER (1867–). An American painter (see VOL. XX). He received the Temple gold medal of the Pennsylvania Academy of Fine Arts in 1914, the Altman prize of $1000 from the National Academy of Design in 1920, and the Mrs. Keith Spalding

prize of $1000 in 1921. He enlisted in the British army in 1915, became captain of artillery, and saw active service in France.

SCHOOLS OF AGRICULTURE. See AGRICULTURAL EDUCATION.

SCHREINER, GEORGE ABEL (1875–). An American author, born in Germany. He served in the Boer War on the side of the Boers, came to the United States in 1900, and was naturalized six years later. He was managing editor of the San Antonio (Texas) *Light-Gazette* in 1912–13 and acted as war correspondent for the Associated Press in many countries. His writings include: *The Iron Ration* (1918); *La Détresse Allemande* (1918); *From Berlin to Bagdad* (1918); *The Craft Sinister* (1920); *Entente Diplomacy and the World*, with B de Siebert (1921); *How America Decided the World War*, from the MS. of General von Falkenhayn (1922); *International Communication—Its Means* (1924).

SCHUCHARDT, HUGO (1842–). A German philologist and university professor (see VOL. XX). His recent works are: *Aus dem Herzen eines Romanisten* (1915); *Berberische Hiatusstilgung* (1916); *Zu der Romanischen Benennung der Milz* (1917); *Sprachverwandtschaft* (1917); *Die Romanischen Lehnworter im Berberischen* (1918); *Sprachursprung* (1919–20); *Sprachenbrewer* (1922).

SCHÜCK, JOHAN HENRIK EMIL (1855–). A Swedish historian (see VOL. XX). He published: *Engelbrekt* (1916); *Shakspeare och Hans Tid* (1916); *Fran det Forna Upsala* (1917); *Messenius* (1920); *Ut Axel Reuterholms Dagbok* (1921).

SCHUMACHER, HERMANN A(MANDUS) (1868–). A German economist and writer on the science of government (see VOL XX). His works after 1914 include: *Der Panama Kanal und Seine Bedeutung* (1914); *Die Stellung der Deutschen Seeschiffahrt in Weltverkehr* (1914); *Deutschlands Volksernahrung und Volksernahrungspolitik im Kriege* (1915); *Deutschlands Stellung in der Weltwirtschaft* (1915); *Meistbegunstigung und Zollunterscheidung* (1916); *Antwerpens Weltstellung und Seine Bedeutung fur das Deutsche Wirtschaftsleben; Belgiens Stellung in der Weltwirtschaft* (1916); *Der Deutsche und Belgische Weltbewerb und Seine Regelung* (1916); *Deutschland und Englands Finanzielle Kraft* (1917); *Gegenwartsfragen des Sozialismus* (1920).

SCHURIG, ARTUR (1870–). A German writer and critic. He was born at Dresden and studied at the universities of Leipzig and Berlin. He is the author of: *Wolfgang Amadeus Mozart* (1913); *Das Leben eines Sonderlings*, a life of Beyle-Standhal (1921); *Konstanze Mozart* (1922); *Franzisco Pizarro* (1922); and two volumes of essays, *Anti-Tagore* (1921), and *Katechismus der Lebenskunst* (1922). He also wrote two novels, *Seltsame Liebesleute* (1913), and *Gottfried Buttervogel* (1923), and translated and edited works by Beyle, Flaubert, Julie de l'Espinasse, J. G. Prod'homme, Balzac, Taine, and others.

SCHWAB, CHARLES M. (1862–). An American capitalist (see VOL. XX). At the urgent request of President Wilson in 1918, he put all his great private interest aside and became director general of the Emergency Fleet Corporation, created for the purpose of producing sufficient ships to transport American troops to France. His energy and qualities of leadership cleared away difficulties and stimulated work so that all records were broken and the most hopeful estimates surpassed.

SCIENCE, AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF. An organization founded in 1848 and incorporated in 1874. Connected with it are 81 officially associated societies, of which 49 are affiliated and have representation in the Association council. Twenty-seven scientific societies became affiliated in the period from 1914 to 1924 Besides the affiliated national societies, 12 State academies of science became affiliated. The membership of the Association itself increased from some 8300 in 1914 to approximately 13,000 in 1924. The registered attendance at the annual meetings was between 1800 and 2400. Besides the annual winter meetings, summer meetings were held at San Francisco, Salt Lake City, and Los Angeles. In the decade after 1914 the Association was much strengthened by the organization of the Pacific Division and the Southwestern Division, which act autonomously and hold summer meetings in their respective regions. The permanent funds of the Association increased, roundly, from $110,000 in 1916 to $132,000 in 1924. The weekly journal continued to be the official organ of the Association. A volume of *Summarized Proceedings*, including a directory of members, was published in 1915 and another in 1921; the next was to appear in 1925. The committee of 100 on scientific research, organized early in 1914, was the beginning of a nation-wide endeavor to accelerate systematic research A joint committee on conservation, organized early in 1921, was made up of three committees representing the United States National Academy of Sciences, the United States National Research Council, and the American Association. It aims to study the problem of conservation in a broad way and to aid in bringing the subject properly before the public of the United States, Canada, and other countries. The Association coöperated with the United States National Academy of Sciences and the United States National Research Council in the lately founded Science Service, whose aim was to disseminate truthful and at the same time readable information about scientific subjects President in 1924, J. McKeen Cattell, editor of *Science*. The Association published resolutions favoring the general adoption of the metric system of weights and measures and clearly stating the impregnable position of the scientific theory of evolution.

SCIENCES, NATIONAL ACADEMY OF. A body of American scientists, incorporated in 1863 for the purpose of investigating, examining, experimenting, and reporting on any subject or art, when called on by any department of the government. The activities of the Academy during the decade 1914–24 were varied and important. In 1916, as a result of a movement to mobilize the nation's science for industrial progress and military efficiency, the National Research Council was established, with John J. Carty as chairman. Dr. W. H. Welsh and G. E. Hale investigated in England the effect of the War on scientific research and industrial progress. During 1916 the Academy made an investigation of the Panama Canal slides. At the annual meeting of the Academy held in Philadelphia in 1917, Dr. Hale delivered an address on the work of the National Research Council. The meeting in 1918 was held at

Johns Hopkins University. The matters discussed, chiefly technical, related to chemistry, astronomy, medicine, and other sciences. The autumn meeting of 1919 was held at Yale University. Addresses were made by W. M. Davis on four cliff islands in the coral seas; C B Davenport and A. J. Love, on defects found in drafted men; and John M. Clarke, on some restorations of distinct vertebrates. There were also discussions of subjects relating to geography, chemistry, astronomy, and physics At the meeting held in Washington in 1920, interesting addresses on important subjects were delivered by A. A. Michelson, C. B. Davenport, F. V. Coville, L. J. Briggs, and others In 1921 the annual meeting was held in Washington. There was again discussion of important phases of science, including mathematics, physics, astronomy, medicine, and geology. An interesting paper was read by Maude Slye on the influence of heredity on the incidence of cancer. At the meeting in 1922, held in Washington, important papers included one by H. F. Osborne, entitled "Recent Discoveries on the Antiquity of Man," and one by J. S. Ames, "Recent Progress in Aeronautics." In 1922 a building for the National Academy and the National Research Council was under construction. This was made possible by a gift of $5,000,000 from the Carnegie Corporation and contributions from friends of the Academy and Council. The autumn meeting of 1923 was held at Cornell University. Many papers embracing a variety of subjects in the scientific field were read. The Academy awards several prizes and medals for eminent contributions to science, and grants in aid of researches are made from the income from trust funds administered by the Academy. Its publications include *Annual Reports*, *Memoirs*, and *Proceedings*. Additional publications are issued by the Research Council in its bulletin and its reprint and circular series. In 1923 Charles D. Walcott was succeeded as president by A. A. Michelson of the University of Chicago.

SCOTLAND. See GREAT BRITAIN.

SCOTT, AUSTIN WAKESMAN (1884–). An American lawyer and educator, born at New Brunswick, N. J. He graduated from Rutgers College in 1903 and from the Harvard Law School in 1909. He was successively instructor, assistant professor and professor of law at the Harvard Law School, occupying the latter position from 1914 He edited several books on legal subjects and was the author of *Handbook of Military Law.*

SCOTT, CYRIL MEIR (1879–). An English composer, born at Oxton, Cheshire. Having devoted himself chiefly to the study of the piano, he entered the Hoch Conservatory in Frankfort in 1896, and studied composition under I. Knorr. After 1900, he lived at Liverpool, making frequent pianistic tours. In 1920–21, he made a tour of the United States. As a composer he is recognized as the foremost of the English impressionists. So completely did he absorb the spirit of Debussy's art that his best works might easily pass as productions of the French composer His works comprise: a symphony; four overtures, *Christmas, Princesse Maleine, Aglavaine et Sélysette,* and *Pelléas et Mélisande;* two rhapsodies; *Aubade; Arabesque;* three *Dances;* a piano concerto; *La Belle Dame sans Merci,* for soprano and baritone with orchestra; *Helen of Kirkconnel,* for baritone and orchestra; *Nativity Hymn,* for chorus and orchestra; a piano sextet, a piano quintet, three string quartets and a violin sonata; numerous pieces for piano, and songs An opera, *The Alchemist,* had not yet been performed in 1924. He is the author of *The Philosophy of Modernism* (1917). Consult A. E. Hull, *Cyril Scott: Composer, Poet and Philosopher* (London, 1918; 2d ed, 1921).

SCOTT, JAMES BROWN (1866–). An American authority on international law (see VOL. XX). He was special adviser of the Department of State, and chairman of the Joint State and Neutrality Board (1914–17), and technical delegate to the Paris Peace Conference (1919) In 1915, he became president of the American Institute of International Law, and in 1910, trustee and secretary of the Carnegie Endowment for International Peace. His later books include *An International Court of Justice* (1916); *Peace Through Justice* (1917); *A Survey of International Relations between the United States and Germany, Aug. 1, 1914–Apr. 6, 1917* (1918); *James Madison's Notes on Debates in the Federal Convention of 1777 and Their Relation to a More Perfect Society of Nations*

SCOTT, LEROY (1875–). An American author, born at Fairmount, Ind, and educated at Indiana University On graduation he engaged in newspaper work (1897–1900) and later was assistant editor of the *Woman's Home Companion* (1900–01). During 1902-03 he was assistant headworker of the University Settlement in New York City and afterward devoted his whole time to writing His books include: *The Walking Delegate* (1905); *To Him That Hath* (1907); *Counsel for the Defense* (1912); *No 13 Washington Square* (1914; dramatized, 1915); *Partners of the Night* (1916); *Mary Regan* (1918); *A Daughter of Two Worlds* (1919); *Children of the Whirlwind* (1921); *Cordelia the Magnificent* (1923)

SCOTT, WALTER DILL (1869–). An American university president and psychologist, born at Cooksville, Ill., and educated at Northwestern University and at McCormick Theological Seminary. He began his career as associate professor of psychology and education at Northwestern University in 1901 and became president of that institution in 1920 He was director of the Bureau of Salesmanship Research of the Carnegie Institute of Technology during 1916 and 1917 and has been president of the Scott Company, consultants and engineers in industrial personnel, since 1919. In 1917 he was appointed director of the committee on classification of personnel in the United States Army, and in 1918 he was made colonel. For his personnel classification work he was given the Distinguished Service Medal He wrote. *Die Psychologie der Triebe* (1900); *The Theory of Advertising* (1903); *The Psychology of Public Speaking* (1907); *The Psychology of Advertising* (1908); *Influencing Men in Business* (1911); *Increasing Human Efficiency* (1911); *The Psychology of Advertising in Theory and Practice* (1921); *Science and Common Sense in Working with Men* (1921); *Personnel Management* (1923).

SCOTTI, ANTONIO (1866–). An Italian dramatic basso (see VOL. XX). In the spring of 1921, after the close of the regular season at the Metropolitan Opera House, he organized the Scotti Grand Opera Company, recruited

largely from the Metropolitan artists, which made a very successful tour of the eastern cities. This tour later became an annual event.

SCRANTON. A mining and manufacturing city of Pennsylvania The population rose from 129,867 in 1910 to 137,783 in 1920; to 140,636, by estimate of the Bureau of the Census, for 1923; and by city estimate to 151,000 in 1924. Weston Field, a community building and public playground, was constructed. A new junior high school was erected, as well as several industrial and commercial buildings After the collapse of certain mine galleries under the city, causing surface subsidence, the operating companies took greater precautions in their methods and assumed responsibility for the damage done to surface property.

SCULPTURE. The effect of the War upon sculpture was at first disastrous. In practically all European countries production gradually and then almost entirely ceased. Soon after the close of the War a revival came. The call for war memorials was extensive, and sculptors were as much in demand as ever. The tendencies remained about the same as just before and during the first years of the War.

France. On Nov. 17, 1917, Rodin, born 1840, the greatest of French sculptors, died His art was the culmination of the naturalism of the nineteenth century, and it was chiefly he who developed the highly pictorial character of most contemporary art. His breaking up of the surfaces into bosses and hollows to attain the subtle modeling and effects of light and shadow in which he so greatly excelled and his rendering of instantaneous movement realized in sculpture a measure of representation thitherto confined to painting. The impressionism of his later period, neglecting more and more the nonsignificant parts and emphasizing only the characteristic and essential, paved the way for the sketchy character of most modern work and finally for the vagaries of postimpressionism. The dominating feature in the later development of French and indeed of European sculpture was undoubtedly the influence of Rodin, which may be compared with that of Michelangelo on Italian sculpture of the sixteenth century, when as in the later time it was easier for less gifted artists to copy the master's weaknesses than his strength. The peculiarities which in Rodin's work were balanced by marvelous modeling and profound depth of sentiment often became mannerisms in the works of his less gifted followers. This influence was in part disastrous, aided as it was by other disintegrating tendencies in French art Even the older men, Rodin's immediate contemporaries, lost their bearings. The public monuments of France just before the War were for the most part tawdry, in poor taste, and unmonumental. This was apparent in the later work of such able artists as Mercié, Fremiet, Barrias and others, and to a less extent in those of Saint Marceaux and Falguière The next generation followed for the most part in these footsteps. The later work of men like Denys Puech, François Larche, Verlet, Villeneuve, Charpentier, and others possessed the same false note.

Salvation came from a group of younger men, also under the influence of Rodin, who, following Bartholomé's advice, carved great simple figures in native limestone, as the mediæval masters did. One of the three foremost of these, Aristide Maliol (1861–), an artist of elemental power and primitive methods, strives for sculptural bulk. Émile Bourdelle (1861–) was Rodin's direct and most powerful successor, whose mighty portrait heads and dramatic reliefs well emulate his master's. Henri Bouchard (1875–), a strong and highly characteristic master, was a versatile and well-balanced artist, and perhaps the most important of the three Among sculptors practicing the more finished modeling along traditional lines and whose works are of real artistic worth were the clever François Sicard, Quilivic for Breton subjects, Constant Roux, Cordonnier, Jules Desbois, Gustave Michel, Jean Boucher, and later, Marcel Jacques, Maurice Faure, and Jeanne Hanin. The War brought the usual crop of designs for military memorials, mostly bad.

Mention may be made here of postimpressionism, the reaction against the unbridled naturalism and cleverness of much official French sculpture. For although its chief exponents were not native Frenchmen, yet they studied in Paris, and it was there that they found their principal support. Postimpressionism endeavors to represent the human figure in a purely abstract way, with little or no reference to actuality The method consists in the elimination of almost all modeling except of the parts chosen for characterization, which are exaggerated out of all semblance to nature. This is exemplified in the strange portraits, usually expressing a highly rarefied type of humanity, by Constantin Brancusi, a Rumanian. Other well-known representatives were Gautier-Brzeska (1891–1915), a young man killed in the trenches during the War, who belonged to the vorticists, and Aleksandr Archipenko, the most important of the group. The latter simplifies the parts of the human body into geometrical shapes and exaggerates its curves in taking various postures, thus achieving sculptural bulk. The little figures of Henri Matisse are as curious as his paintings. Umberto Boccioni, an Italian futurist, tacked all kinds of actual objects such as glass, wood, cardboard, cloth, and electric lights, to the sculpture represented; in this he followed the custom of futurist painting. See PAINTING.

Germany. From the early years of the twentieth century a veritable renaissance of sculpture took place in Germany and Austria. Nowhere else was the change as marked. The outworn realism and romanticism of the late nineteenth and early twentieth centuries were replaced by a new and more vital naturalism, of a strikingly simplified and essentially decorative character. The new sculpture was conceived as a part of the building or monument to which it belonged, subordinated to the *Massgefuhl*, i.e. the feeling for the mass of the whole. It combines technical ability of a high order in modeling, carving, and casting with a mastery of the most varied materials of sculpture. It seeks to express character, and its chief attribute is power, even to the point of brutality This new German style found its most striking expression in a series of national monuments, such as the colossal statue of Bismarck at Hamburg by Hugo Lederer, conceived in the style of the mediæval effigies of Roland, and the Völkerschaft Monument, commemorating the battle of Leipzig, by Bruno Schmitz, the largest military monument in the world. The sculptures of the latter, by Franz Metzner, are in a class by themselves, colossal, harmonious, and mysterious. The clever adaptation of sculpture to

architectural effects is seen also in many recent buildings. In the Haus Rheingold, a Berlin restaurant, Metzner employed the human body as a purely decorative form with astounding effect. Other examples of subordination and simplification are the reliefs of the Bürgertheater in Vienna by Luksch-Makowska, and especially the sculptures of the proscenium of the Marble House Theatre in Berlin, by G. S. Sieburg, in which simplification is pushed to the utmost limit.

The most influential and widely imitated figure in the later German sculpture was Franz Metzner (1872–1918), whose art, often grotesque and enigmatic, shows a profound feeling for the mass and is masterful in technique. The best qualities of this modern German sculpture, power, plasticity, and ability, are exemplified in such works of Hugo Lederer (1871–) as the Krupp memorial at Essen. Of powerful monumental quality is also the work of Benno Elkan (1877–), in his fine funerary sculpture, like "The Stone of Lamentation" at Wickrath in the Rhine Province, his lifelike busts, and medals. Anton Hanak (1875–) of Vienna is primarily a sculptor in marble, whose inspiration is Michelangelo and the Greeks. The stone and marble nudes of Hermann Haller, Hubert Kowarik, Hans Damman, and Karl Stemolak are Hellenic in simplification and of fine sculptural quality. A master marble cutter was Theodor Georgii (1883–), whose work is carved directly out of the stone. He was also a leader in animal sculpture, in which connection August Gaul (1868–) especially and Fritz Behn (1878–) should be mentioned. Other important carvers of stone and marble among the younger men were Georg Kolbe, Arthur Lange, Ernst Seger, Joseph Limburg, and Adolf Brütt.

The decorative talent of the contemporary German school was especially evinced in the treatment of most diverse materials, as in Joseph Wackerle's archaistic figures of travertine. Audacious and powerful experiments in tinted sculpture were made by Benno Elkan and others. Charming if startlingly modern effects were attained in porcelain by Theodor Eichler and Bernhard Hötger of Darmstadt. Woodcarving was practiced more extensively and enthusiastically in Germany than elsewhere, by Hermann Haller in Berlin, Richard Langer in Munich, and especially Franz Barwig in Vienna.

Other European Countries. Among sculptors who died in Great Britain during the decade 1914–24 was Sir George Frampton (1860–1923), known especially for his polychrome sculptures. His monument to Edith Cavell, erected in St. Martin's Church, Trafalgar Square, London, in 1920, shows his conversion to Greek archaism, a very startling change. This is a sign of the diminishing vogue of the union of the arts and crafts movement with sculpture, so successfully practiced by Alfred Gilbert (1854–) and his followers. The list of dead includes also Thomas Brock (1847–1922) and Robert Colson (1867–1921). The outstanding feature of British sculpture of the day was the prevalence of the French influence, modified by the more ascetic requirements of British taste. Among the older men Hamo Thornycroft (1850–) and Alfred Drury (1859–), the foremost representative of the French influence in England, continued an important activity. Of great imaginative power and originality is the work of Bertram MacKennal (1863–), an Australian trained in Paris, although his later memorials showed increased conformity to prevailing British tastes. His equestrian statue of Edward VII in Trafalgar Square was unveiled in 1921. Gilbert Bayes (1871—) was known chiefly for the use of the horse as a motif and for his interesting accessories. Among other men whose work is noteworthy were S. Nicholas Babb (1874–), Albert Toft, Ernest Gillick, Benjamin Clemens; Richard Garbe, whose art is characterized by a certain brutal strength; Havard Thomas, and Derwent Wood. Mention should also be made of the highly characteristic and very modernistic productions of Jacob Epstein (1880–), who was born in New York and received his principal artistic education in Paris. His "Christ" in particular provoked much discussion.

In Belgium, the glorification of labor, so ably begun by Meunier, was notably continued by J. van Biesbroeck, of Ghent. The more conservative tendencies were represented in the work of Victor Rousseau (1865–), whose bronze group entitled "Gratitude," erected in Trafalgar Square in London, was presented by Belgium to Great Britain in 1920. The most startingly original of Belgian sculptors of the period was Georges Minne (1867—), likewise of Ghent, whose spare and highly stylized figures are of great power.

Scandinavian art of the period was very modern and showed the French influence, modified by native requirements. The lifelike and rather unfinished works of Carl L. Eldh (1873–) are impressionistic in character. Carl Milles (1875–) shows great versatility of subject, ranging from dancing girls to prehistoric monsters; he is always monumental in his presentation. Mention should also be made of the lively imaginative Icelander, Einar Jonsson.

Russian sculpture was cosmopolitan in character, as the artists were trained and lived largely abroad, especially after the social revolution. The art of Prince Paul Troubetzkoy (1866–), born in Italy, self-taught, and much influenced by Tolstoy, is clever and impressionistic in character. Naoum Aronson, who resided in Paris, was a striking individualist, excelling especially in his interpretation of children. Modernism had numerous representatives, chief among them Archipenko.

The Italians are the best stone cutters in the world, and their sculpture is characterized by a manual dexterity and florid ornament which proved itself a bane. Biondi (1885–1917) was known for his large groups carved more or less disconnectedly, and often revoltingly naturalistic, with the exception of his latest production, "Les Récluses Misérables," which, strange to say, was highly spiritualized and well composed. Vincenzo Gemito (1852–) modeled charming bronze genre subjects, usually representing Neapolitan urchins. Leonardo Bistolfi (1859–) of Turin created some work of true monumental character, like his fine "Offering" on the Victor Emmanuel monument at Rome. In 1915 a superb Garibaldi monument by Eugenio Baroni was unveiled near Genoa.

Spanish sculpture also suffered from parade of technique and too many accessories. The foremost sculptor at the close of the period was José Clara (1878–), whose art is always

personal and interesting, sometimes even titanic. More or less directly connected with the development in Germany and Austria is the art of the non-German peoples who once formed a part of Austria-Hungary. Their art, like the Germans', emphasizes the mass and strives after power even to brutality. Among the prominent figures were Nicholas Ligeti and Geza Maroti of Budapest and Jan Stursa of Prague, known especially for his subtly modeled figures of girls. Foremost of all was Ivan Meštrović (1883–), born in Dalmatia, in 1924 the national sculptor of Jugo-Slavia. He studied at Vienna under Franz Metzner, whose art his own most resembles, and was also for a time in Paris, where he was influenced by Rodin, who pronounced him "the most remarkable of living sculptors." His powerful and dramatic art shows a certain influence of the archaic Greek, and in religious subjects he goes back to Byzantine traditions.

The United States. In no other country was there such an increase in the output of sculpture during the twentieth century and especially during the decade 1914–24 as in the United States. So great was this that the volume of sculpture produced after 1900 more than equaled all that had been done before that time. One of the reasons for the increased output was the wide use of architectural sculpture, especially on public buildings, and the willingness of important sculptors to devote themselves to such work; another was the great demand for public monuments throughout the country; a third was the demand for garden sculpture, especially for fountains in public parks and private grounds. Owing to the distance of America from the scene of conflict and to its late entrance into the War, there was no such cessation of artistic production there during the War as took place in Europe.

As compared with the development in Europe, American sculpture took a middle course, avoiding conservative and radical extremes, sometimes indeed a little restrained, but escaping the extravagances of postimpressionism. The chief centre of production continued to be New York and its vicinity, where nine-tenths of American artists live and labor. They come, however, from the length and breadth of the land, by far the greater number from west of the Alleghanies, and many from the Far West.

During the decade 1914–24 the United States lost several important sculptors. Foremost among them was Karl Bitter (1867–1915), killed by accident in his prime. His latest works, such as the granite pediment of the Wisconsin State capitol and the Lowry memorial of Indianapolis, show constant development of a decorative sense and mastery of material. A fitting termination for the activity of Henry M. Shrady (1871–1922) was the national U. S. Grant memorial at Washington, D. C., especially the colossal bronze equestrian statue of Grant which ranks among the best of the day. Bela L. Pratt (1864–1917), active as a teacher in Boston, is known for his youthful, girlish nudes; Solon A. Borglum (1868–1922), for cowboy and Indian subjects and many monuments. Among others were John J. Boyle (1852–1917), sculptor of red men; Edith Woodman Burroughs (1871–1918), famed for girlish figures and characteristic portrait busts; and Charles Cary Rumsey (1879–1922), known especially for his horses.

Among the older men, the extensive production of Daniel Chester French (1850–), dean of American sculptors, combined with his customary good taste and pure form a distinct increase in power, as may be seen in the lovely nude "Memory" in the Metropolitan Museum of New York City, the colossal seated Lincoln for the national Lincoln memorial (1919), and the Dupont Fountain (1922), both in Washington, D. C. Besides his monumental sculpture, Herbert Adams (1858–) continued the production of sensitively tinted heads of young women. Charles H. Niehaus (1853–), "indefatigable builder of monuments," had a number of later works to his credit, like the Francis Scott Key monument at Baltimore (1922), and so had J. Massey Rind (1860–), besides a vast quantity of decorative sculpture.

The later works of Frederic MacMonnies (1863–) continued his novel and exotic ideas, as witness the Denver "Pioneer" fountain and the Princeton battle monument. George Gray Barnard's (1863–) profound, symbolic work is worthily expressed in some of his recent statues, like "Woman" (Metropolitan Museum, New York City). His powerfully realistic and magnificently characterized bronze Lincoln (Cincinnati, Ohio, and Manchester, England) caused more discussion than perhaps any other American statue. Paul Bartlett's (1865–) thoughtful and skillful technic is revealed in the grandiose pediment of the House of Representatives in Washington and his delicate architectural figures on the New York Public Library. Gutzon Borglum (1876–) was in 1924 engaged on a group of 42 heroic figures in bronze for Newark, N. J., and on a colossal relief, 700 feet by 100 feet, involving several hundred figures, carved in the face of Stone Mountain, near Atlanta, Ga. The latter was intended as a memorial to the Confederate Army and when completed was to be the most colossal work of sculpture ever attempted.

Among other sculptors producing important public monuments were Hermon A. MacNeil (1866–); Albert Jaegers (1868–), who did the fine "Pioneer" monument at Germantown, Pa.; Edmond T. Quinn (1868–), whose work is tasteful and conscientious; Alexander S. Calder (1870–); Adolph A. Weinman (1870–); and Augustus Lukeman (1872–). The Piccirilli family is celebrated for skillful marble cutting. An important later work by Attilio Piccirilli (1866–) was one of the pediments of the Wisconsin State capitol at Madison, and by his brother Furio (1870–), a statue of Pierre Gautier de la Varenne, forming part of the decoration of the Parliament House at Winnipeg in Canada, which is entirely in his charge. Charles Grafly (1862–), the well-known teacher in Philadelphia, in the late years of the decade, devoted himself to portraiture, in which he was unsurpassed in American sculpture. Lorado Taft (1860–), dean of Chicago sculptors, in later years devoted himself to the creation of fountains, like the "Fountain of Time" in Chicago (1922). Cyrus Dallin of Boston (1861–) continued his distinctive work, the representation of the American Indian.

Among animal sculptors, Phinister Proctor (1862–) had begun to subordinate his animals to the human figure in a series of monuments. Edward C. Potter's latest works included the much discussed lions at the Public

Library in New York. Excellent indeed are the animal bronzes of F. C. R. Roth; Eli Harvy; Albert Laesle (1877–), who depicts in unique manner the humor of animal life; and Anna V. Hyatt (Mrs. Archer Huntingdon) (1876–). Her spirited equestrian Joan of Arc on Riverside Drive, New York City, was a stirring conception. The War offered fine opportunity for the medalists, chief of whom in the United States were John Flanagan (1865–), designer of the well-known Médaille de Verdun (1921), and Victor D. Brenner (1871–).

The sculpture of the men born after 1870 was full of promise for the future. Andrew O'Connor's (1874–) figures, like the "Soldier" of Worcester, Mass., and the Lincoln at Springfield, Ill., are virile in conception and well-modeled. The art of James Earle Fraser (1876–) is marked by skill and good taste, as in "The End of the Trail" (San Francisco), and his relief is wondrously delicate. Lee Lawrie (1877–), of German origin, was an architectural sculptor, as witness the figures of the reredos of St. Thomas's Church in New York City. Mahonri Young (1877–), well-known as a teacher, specialized in characteristic statuettes of laborers. Rudolf Evans (1878–) became famous as a carver of beautiful nudes through "The Golden Hour," in the Luxembourg, Paris, and Metropolitan Museum, New York City. Robert Aitkin (1878–) was a strong yet versatile artist, whose monuments, garden figures, busts, coins, and medals were widely known. Grace and charm are the marked characteristics of the carefully modeled work of Edward McCartan (1878–). The vivid portraits by Jo Davidson (1883–) of figures prominent during the War are powerful artistic as well as historic documents.

The American Academy at Rome had a marked influence on later American sculpture through the young men who enjoyed its four years' scholarships. The dominant note of their art is Greek archaism in all decorative and conventional features but less in figure modeling. The execution is on the whole more finished than that of the group which studied chiefly in Paris. Sherry Fry (1874–) combined the archaic note with careful and interesting modeling. John Gregory (1879–) is known for charming garden figures. The art of Chester Beach (1881–) reflects rather the Rodinesque than the archaic motive. It is clear, individualized, and of rugged quality. Likewise the art of Albin Polasek, an excellent portraitist, and in 1924 instructor in the Art Institute in Chicago, is also rather naturalistic than archaic. The chief representative of the latter-day classicism was Paul Manship (1885–), a master craftsman of archaic decoration, combined with skillful modeling of the nude. In Leo Friedlander's (1889–) work the archaic is united with a certain brutal power reminiscent of the modern German school.

A striking feature of the development of American sculpture during the period was the large number of distinguished women, greater than in any other country and larger than that of women painting in the United States. Although practicing all branches of sculpture, they excel especially in representing women and children, garden sculpture, and small bronzes. Janet Scudder (1873–) is known for her fountain figures; Bessie Potter Vonnoh (1872–), for simple domestic scenes invested with great charm; Abastenia Eberle (1878–), for plastic sketches of the humble life of a great city. Evelyn Beatrice Longman (1874–) has created a series of busts, bronze doors, and memorials; Laura Gardin Fraser (1889–), nudes and miniature reliefs; Anna V. Hyatt, animals; Malvina Hoffman (1887–), spirited figures and groups; Frances Grimes, graceful marble reliefs; Harriet W. Frishmuth (1880–), dramatic nudes. Mention should also be made of Gertrude Vanderbilt Whitney, whose sculpture, always original, became strongly personal.

Modernist tendencies found little echo in American sculpture. Their chief representative was Gaston Lachaise, a Frenchman, trained in the Beaux Arts, but whose sculpture was produced in New York.

Bibliography. The best comprehensive view of the development of the period is Lorado Taft's *Modern Tendencies in Sculpture* (Chicago, 1921). Other accounts are by C. R. Post, *A History of European and American Sculpture*, vol. ii (Cambridge, 1921); and Kineton Parkes, *Sculpture of To-Day* (London, 1921). For the United States, consult the supplementary chapter to Lorado Taft's *History of American Sculpture* (New York, 1923). See also Adeline Adams, *The Spirit of American Sculpture* (New York, 1923) and the current art magazines.

SCURVY. The ideal antiscorbutic diet was still undetermined in 1924. Originally the disease was attributed in part to the substitution of salted for fresh meat Experiments on animals have shown that although fresh meat contains antiscorbutic vitamine, it is insufficient to prevent the development of scurvy if the diet is otherwise free from the Vitamine C. There is evidence that to contain effective Vitamine C, the meat must be raw and quite freshly killed. Arctic explorers escape scurvy at times by subsisting on freshly killed game; fresh fish is devoid of this vitamine, and this is also true of the fat of meat Indians and Esquimaux appear to prefer fresh viscera to fresh muscle and always bargain for the former when dividing game with white men. It goes without saying that all preserved and tinned meat is unsuitable in an antiscorbutic dietary, and raw viscera are out of the question for white men. There was considerable propaganda for the purpose of prevailing on the white man to settle permanently within the Arctic Circle; this was based on the century-old misrepresentation concerning this climate. Steffansson has shown that the weather there can be matched in every way with that of certain portions of the northern United States. The degree of cold, amount of snow, and other seasonal drawbacks are not materially worse in the Arctic and are often better. A greater drawback might be scurvy due to the absence of fresh game and other foods containing the Vitamine C. To go through the winter free from scurvy there would have to be a plentiful supply of potatoes, apples, canned tomatoes, and fresh milk; dried and evaporated vegetables would not serve.

SEARES, FREDERICK HANLEY (1873–). An American astronomer, born at Cassopolis,

COURTESY OF BROWN-ROBERTSON CO., INC.

JAMES EARL FRAZER

"THE END OF THE TRAIL"

In the Golden Gate Park, San Francisco, California

Mich. He studied at the University of California and in Berlin and Paris. During 1901–09, he was professor of astronomy and director of the Laws Observatory at Missouri In 1909, he was called to the charge of the computing division and of the publications of the Mt. Wilson Observatory of the Carnegie Institution. Among the special investigations by which he advanced the knowledge of astronomy are studies on the theory of orbits and perturbations, distribution of stars, and the general magnetic field.

SEATTLE. The twentieth city in the United States and the largest north of San Francisco and west of Minneapolis. In 1923 Seattle ranked second to New York in the number of people entering the United States through it and was outranked only by New York and Boston in value of foreign imports The population increased from 237,976 in 1910 to 315,685 in 1920 and to 355,000 by local estimate for 1924. In 1919 Seattle purchased the street railway system on a $15,000,000 public utility bond issue; in 1924 it supplemented its municipal power plants by the first unit of the Skagit River power development The municipality also added some $5,000,000 to its investment in waterfront terminals at Smith Cove, including a municipal pier more than half a mile long, used for trans-Pacific shipping. A fireproof concrete municipal grain elevator was built At the close of the War a memorial civic centre was planned. Between 1909 and 1924 there was an increase of 163 per cent in the number of manufacturing establishments, 537 per cent in the number of employees, and 98 per cent in the value of products Bank clearings increased 251 per cent, from $90,093,365 in 1910 to $2,072,639,436 in 1920, deposits, 96 per cent, from $78,827,201 to $154,530,874, foreign imports, 1012 per cent, from $21,668,831 to $241,112,184, foreign exports, 1233 per cent, from $10,150,702 to $135,312,904; domestic imports, 375 per cent, from $28,143,402 to $133,823,985; and domestic exports, 115 per cent, from $36,128,105 to $77,774,124.

SECRET TREATIES. See WAR, DIPLOMACY OF THE

SECRETIONS, INTERNAL. Endocrinology made prodigious advances in the decade 1914–24, as shown by the formation of a national society for the study of internal secretions, the appearance of a quarterly magazine devoted to the subject, and the publication of an encyclopædic work on the endocrines edited by Dr. Barker of Johns Hopkins Naturally the subject of organotherapy belongs under this heading, including insulin and the sensational work in so-called rejuvenation done by Steinach and his followers, Voronoff and others. Dr Barker, in summing up endocrinology in the *Journal of the American Medical Association* (July 8, 1922), prefers the term incretion, signifying internal secretion, to endocrine substance, hormone, etc. Of great immediate interest is the possible difference between active principles found in glands and whole gland substance. The probabilities are that these organs, like certain plants, contain several active principles In addition to the clinical evidences of excess or diminution of production of certain incretions, the results of actual treatment and autopsies, attempts were made at pharmacologic tests in which certain alkaloidal drugs as well as the incretions themselves are injected into the organism for diagnostic purposes in order to determine whether there is a deficiency or superfluity of gland activity. One of the great advances of the decade was the isolation of thyroxin as the representative active principle of the thyroid gland by Kendall at the Mayo clinic. Removal or reduction in size of one suprarenal gland has been practiced many times in Germany in the hope of mitigating incessant convulsions in certain epileptics, since increased convulsibility was believed to be a result of excess of suprarenal tissue. While certain incretions are active in determining the stature, length of long bones, general outlines of the face, and other static peculiarities, others were believed to determine the rate of metabolism and incidentally the temperament of the individual.

Effects of Faulty Foods. This subject was studied by McCarrison of India with special reference to the presence or absence of vitamine It is evident that the phenomena seen in deficiency diseases are due largely to the effects produced on the endocrine glands. Other groups of symptoms were due to simple starvation, unbalanced diet, and excess of fat. It is remarkable that in prolonged fasting the suprarenal glands enlarge, although all other endocrine bodies undergo reduction in size The thyroid gland is reduced, to two-thirds its normal size, but the weight of the suprarenal may double. If the animals then receive plenty of food with exclusion of vitamine, the results show much similarity, although in some males the pituitary body enlarges as well as the suprarenals This group of symptoms is produced also by simple deprivation of vitamine B; absence of vitamines A and C is without these effects. If on the other hand plenty of vitamine is given without any protein in the food, there is reduction in size of some of the endocrines, but it is very slight in some of them; the pancreas is the chief sufferer. In this group as in the others, the suprarenals were notably enlarged. If the diet did not contain the normal calory requirement, analogous behavior was noted. The significance of the enlargement of the suprarenals does not mean any effort at compensation, for it has long been known that their secretion is deficient in fasting. Hence, practically all of the endocrine glands suffer through improper feeding of any kind. In overfeeding with fat, the thyroid enlarges and the suprarenals become smaller The thyroid is genuinely enlarged, much as in Graves's disease. McCarrison indeed terms the condition goitre and associates its cause in such cases with relative absence of iodine from the diet. In normal thyroid structure and function there is a balance between diet fat and iodine.

Gonads or Sexual Glands. The fact that castration of immature animals prevents the full development of secondary characters led to the general belief that the sexual glands are the sole seat of sex. The various operations for procuring so-called rejuvenation are based on this conviction. Many isolated facts antagonize this belief, and it became increasingly evident that sex differences extend throughout the entire organism. In other words, a woman is not a woman because of her ovaries but has ovaries because she is a woman. It is also possible to show that sex is a matter of degree or development rather than a basic antagonism. The substratum of the individual is believed to be female, with an evolutionary tendency to

maleness. The unfertilized ovum is all female, and fertilization is necessary for maleness to develop. Once maleness has developed it is stable and immutable, but femaleness is essentially transitory. After the termination of the breeding cycle, the female may take on a number of male secondary characters, although there are no male sexual glands to explain the phenomenon. Otherwise sexually entire individuals have been born without sexual glands, and castration even of the very young male animal sometimes fails to deprive it of maleness. Since the substratum is essentially female, there is originally but one type of gonad, the ovary. In physical hermaphrodites and, it is also claimed, in the psychical form or sexual invert, an apparent testicle may prove under the microscope to be a so-called ovotestis or ovary only partly differentiated into a testis. It is evident that the relative number of males and females in a community depends on the amount of development from ovary to testis. In some of the lower animals such as tadpoles it is possible to stimulate the development, so that instead of normal equality of numbers only male adults develop. Study of individuals often shows dissociation of secondary sexual characters; thus the plumage of certain birds is part male, part female In general, sex resides in the individual cell, in the chromosomes.

Relation of the Gonads to Sex. This question could be answered only imperfectly. In the latter years of the nineteenth century no one doubted that the kind of gonad determined the sex entirely, but in the interim there was a steady accumulation of evidence to the contrary, largely as the result of animal experiment. It was learned that in the absence of a functioning thyroid, sexual development is defective. In certain experiment animals it was shown that implantation of testes into castrated females changes them into males, but the converse is not true; implantation of ovaries into castrated males does not change them into females. The development of certain tumors in the region of the adrenal glands occurring in females will effect transformation into males, with certain physical limitations such as suprarenal virilism; and in these changes the ovaries play no part.

It is true, however, that grafting testicular substance into various types of animal and man will produce striking phenomena, as shown especially by the experiments of Steinach on rats. These researches were carried out for years on male and female, old and young, castrated and entire. It was noted that in addition to change in sex characters there was also an alteration in age characters. Thus it was apparently possible not only to alter the sex of an animal but to alter its age; in other words, to rejuvenate it. In order to understand the bearing of such experiments it is necessary to know much about ordinary breeding of strains of animals, including crossing and hybridism, and the natural history of intact and castrated animals of both sexes. It must be remembered that the animals lead artificial lives, are purposely bred for experiment, and so on. Thus Steinach's results were at one time disputed; breeders made the claim that his old senile rats who became young again were only sick rats who improved in health because of the favorable conditions secured by the experiments. Steinach seemed to have disproved this charge.

Division or Ligation of the Duct. Steinach, who at first advocated actual implantation of material from the sexual glands to produce the similitude of rejuvenation, later discovered in the course of experiment that simple division or ligation of the spermatic duct produced such stimulation of the interstitial portion of the testis as to produce the same therapeutic result as actual implantation. Owing to the difficulty of obtaining testicular material, this discovery was hailed as of major importance, for any surgeon could perform the operation at any place or time. The results of section of the duct appeared to be very unequal, striking in certain cases and negative in others. These discrepant effects were variously explained. The benefits in some cases supervened so rapidly that they were attributed to mental impression. Attention was also called to the fact that division of the duct as an incidental step in the operation of removing the hypertrophied prostate was practiced thousands of times without any evidence of rejuvenation, but the counterclaim was made that there was often more improvement in the general health after excision of the prostate than could be explained by mere removal of an obstruction; some very old men secured a new lease of life and usefulness.

The direct result of ligation or division of the duct is destructive; the sperm forms cells undergoing atrophy. This in turn is followed by an overgrowth of the connective tissue in which are imbedded the Leydig cells which supply the internal secretion of the male gonad. This state of affairs is not permanent, for the spermatic cells show some regeneration; at the same time the Leydig cells are reduced in number. The favorable results are more noticeable in premature senility, i.e. in men less old in years, than in men in the seventies and eighties. In the really old, the benefit, when present, is of the nature of a general tonic, while in the prematurely old there may be in addition improvement in defective sexual functions.

Implantation of Testicle. This operation did not originate with Steinach, for it was performed by Lespinasse and Lydston both of Chicago and independently of each other, on human beings and using human testicles. Others who followed them used the testicles of animals, including those of apes, rams, beeves, etc. This entire line of experiment is derived from the much older transplantation of ovaries, which has long been a recognized procedure, although largely limited to implantation of the woman's own ovaries after the operation of total removal of the uterus and appendages The object of such transplantation has nothing in common with rejuvenation or reinvigoration but is solely to protect the woman from the trying symptoms which follow castration. In implanting the testicle, the same idea has been entertained in cases of accidental castration; such cases are few in comparison with the opportunities which daily present themselves of premature old age, functional loss of virility, and general breakdown of health. The simplest and easiest method consists in implanting a small slice of beef's or ram's testicle under the skin of the abdomen. The testicles of men and apes have been used in a few cases Dr. Belfield summed up the subject of testicular implantation by stating that in the elderly the benefits, when apparent, are but shortlived. In young men who have had their gonads removed

by accident or surgery or who have lost them as a result of destructive disease, the good results are more in evidence and the period of recovery longer, although it lasts only some months. The operation may of course be repeated indefinitely. It is by no means certain that this improvement is specific in character. The work of Voronoff largely corroborated that of Steinach, although his experiments were conducted on goats and rams. Human experience is not recorded in his books. Steinach and his followers have reported many cases of gonad grafting in men and in women as well.

SECRIST, HORACE (1881–). An American economist, born at Farmington, Utah. He studied at the University of Wisconsin, where he took his Ph.D in 1911. In 1909, he became instructor of economics at Wisconsin, where in 1918 he became professor of economics and statistics. In 1909, he was expert special agent of the United States Census Bureau, and during 1911–12, statistician of the Wisconsin Industrial Commission, becoming also in 1914, United States Commissioner of Industrial Relations. During the War, he was the statistician of the tonnage section of the United States Shipping Board and later was supervising statistician of the United States Railroad Labor Board. In addition to many articles variously contributed, he is the author of *An Economical Analysis of the Constitutional Limitations on Public Indebtedness in the United States* (1914); *Readings and Problems on Statistical Methods* (1920); *Costs, Merchandising Practices, Advertising and Sales in the Retail Distribution of Clothing* (6 vols, 1921).

SEGUR, PIERRE M. H., MARQUIS DE (1853–1916). A French historian, born in Paris, and educated at the College of Stanislas. He entered the public service in 1876 as auditor to the privy council but after a short time relinquished that office to devote himself to the study of French history and literature. He became a member of the French Academy in 1907. His writings consist of studies of the seventeenth and eighteenth centuries, several histories covering the reign of Louis XVI, and various articles and discourses, including: *Gens d' Autrefois* (1903); *Esquisses et Récits* (1908); *Silhouettes Historiques* (1911); and *Parmi les Cyprès et les Lauriers* (1912).

SEIDEL, TOSCHA (1900–). A Russian violinist, born at Odessa. At the age of seven he began to study the violin under Max Fiedemann. From 1909 to 1911, he was a pupil of Alexander Fiedemann at Stern's Conservatory in Berlin, where Auer heard him and offered to teach him free of charge. In 1915, he made a most successful début at Christiania, and for the next three years appeared extensively throughout Scandinavia in recitals and with orchestra, and occasionally in joint recitals with Auer himself. In 1918, he made his American début at New York, and since then has made extensive tours of the country, meeting everywhere with extraordinary success. He is one of the most brilliant of the younger generation of violinists.

SEILLÈRE, ERNEST, BARON (1866–), French philosophical writer, born at Paris. His family came from Lorraine and was allied to the Talleyrand-Périgord, Berglas Saint-Winock, and other patrician strains. He studied at the Ecole Polytechnique in Paris, but instead of pursuing the engineering profession he devoted himself to literature and social philosophy. Strongly influenced by Nietzsche and the doctrine of the will to power, Seillière developed what he called the philosophy of imperialism, that is to say, a philosophy of masculine activity, service and organization as opposed to the effeminate romanticism of Rousseau. He traced all the modern evils, political, social, and æsthetic, to the influence of romanticism. Curiously enough, Seillière was a partisan of Bergson's intuitional philosophy, and even his own doctrine was characterized as an inverted romanticism. The list of his works include: *Ferdinand Lasalle* (1897); *Le Parti Socialiste Allemand* (1898); *La Philosophie de l'Impérialisme; Le Comte de Gobineau* (1903); *Appolon ou Dionysos* (1906); *Nietzsche* (1905); *L'Impérialisme Démocratique* (1907); *Schopenhauer* (1909); *Barbey d'Aurevilly* (1910); *Gustave Flaubert* (1914); *Mme. Guyon et Fénelon* (1918); *Les Origines Romanesques de la Morale Romantique* (1918); *Georges Sand* (1919); *Sainte-Beuve* (1920); *Jean Jacques Rousseau* (1921); *Balzac* (1922).

SEISMOLOGY. Not much was added in 1914–24 to knowledge of the character and effects of earthquakes; their ultimate cause was still very incompletely understood. It was well established that tectonic quakes are due to the movements and vibrations caused by the shock resulting from sudden slips within the solid material of the earth's crust, from fracture consequent on a state of stress; but this practically marked the limit of the science.

Oldham concluded that the faulting of the crust, the direct cause of destructive shocks, is the secondary result of a more deep-seated disturbance of some kind, and that it is the latter, and not the former, which produces the records on distant seismographs. G. W. Walker, following up certain investigations begun by Galitzin on the angle of emergence of the wave paths, likewise found that the focus, although sometimes quite close to the surface, is frequently at a depth of from 300 to 500 miles or more. These conclusions have been confirmed by H. H. Turner through a study of the times of arrival of seismic waves at the antipodes or anticentre. Turner's results for the relative depths of foci suggest that they collect around three chief values, and by identifying these with the three critical surfaces at the respective depths of 106, 232, and 492 kilometers which were previously discovered by Galitzin from direct observations of the angles of emergence at Pulkovo, Turner obtained a value for the surface velocity of P waves agreeing with that observed in the case of the great Oppau explosion on Sept. 21, 1921. He found that 207 kilometers is the depth of the average focus corresponding to the standard seismological tables in use. The destructive quakes probably are those originating in the uppermost layer. On the other hand, Jeffreys, in a study of the waves from the Pamir quake of Feb. 18, 1911, concludes that Walker's theories are totally incorrect.

C. G. Knott finds that the rate of transmission of both the P and S waves increases continuously with distance below the surface until the wave path attains a depth about 0.3 the earth's radius. The wave paths reaching lesser depths than this have a continuously curved form, convex toward the centre of the earth; below this the rate of propagation is nearly

constant, even decreasing at certain depths so that some of the wave paths are concave toward the centre in part of their course. Below 0.6 of the radius the distortional or S wave is killed and is not registered at distances greater than 120° from the epicentre The rate of propagation of the two forms of wave motion is about 6.2 and 4.0 kilometers per second respectively, near the surface of the earth, and about 12.8 and 6 8 at depths over 1500 kilometers. A new investigation of the propagation of seismic waves has also been carried out by J. H. Jeans, who points out that in addition to the Rayleigh L waves there are two series of surface waves which travel around the earth in 126 and 222 minutes respectively. The propagation of seismic waves in a visco-elastic earth has been studied by Hosali.

From a study of the waves generated by the Oppau explosion, which were undoubtedly truly representative of the uppermost layers of the earth's crust, in south Germany, the Netherlands, and Alsace, Wrinch and Jeffreys have found the velocities of the P and S waves to have been respectively 5 4 and 3.15 kilometers per second, considerably less than in the case of ordinary earthquake waves. The Rayleigh waves, being characteristic of the lower basaltic and peridotic layers, were absent, and in their place appeared the Love waves, transmitted largely through the continental granitic layer.

Whether any variations occur in the periods of seismic waves as they radiate outward from the origin has for some time been doubtful. From a detailed study of the records of the California quake of Jan. 31, 1922, J. B. Macelwane found that the period of a long wave at the beginning of the first preliminaries decreases, and that of a very short superposed wave increases, as the distance from the epicentre increases. No relation could be discovered between the periods of the S waves and the epicentral distances. The periods of two maxima in the shorter waves of the principal portion showed a rapid increase with distance.

Under the direction of the Advisory Committee on Seismology of the Carnegie Institution, there has been concentrated on the study of the earth movements and seismic tremors of California probably the greatest assemblage of coöperating agencies ever put to work on a single scientific problem The United States Coast and Geodetic Survey is engaged in laying a network of precise primary triangulation over the State and connecting it with points in Nevada and elsewhere, in order to provide a basis for detecting movements of the crust in California and to verify the slow creeps previously indicated by astronomical observations at the Ukiah latitude observatory and at the Lick Observatory. The survey has already detected irregular movements of 4 to 16 feet which have occurred since the last surveys, made about 1895, mostly northward south and west of the San Andreas fault, and southward north and east of it. The United States Geological Survey, in coöperation with the Seismological Society of America and various geologists, has mapped all known faults in the State, and the Society has published a map showing all these faults; the localities where quakes may be expected are thus indicated, and in these zones the proper location, design, and construction of buildings and other structures may be made to minimize the danger from earthquakes. To aid in tracing the faults out to sea, the United States Hydrographic Office, by means of a new acoustic sounding device, has made a unique contour map of the ocean bottom off the southern California coast out to beyond the edge of the continental shelf. Anderson, of the Mt. Wilson Observatory, has devised a remarkably sensitive portable torsion-pendulum seismometer, which is extraordinarily simple, cheap, and easily set up; the entire instrument weighs only a few pounds, it can be adjusted to record quakes occurring at any distance, and great numbers of these instruments may be set up about the country and used to study in detail the propagation of seismic waves from local tremors through the heterogeneous crust.

The examination of long series of earthquake records has suggested the existence of a number of interesting periodicities in earthquake frequency. Those whose existence seems most certain are 4 years, 15 months, 6 months, and 21 minutes in length, particularly in Jamaica and Italy. After a careful and extensive study of the microseisms which seem to travel from western Europe across Russia into Siberia, dying out as they go, Galitzin concluded that they are not caused by waves beating on the western coast of Europe, as had been supposed. Heavy waves are not always accompanied by micros, and micros frequently exist when there are no heavy waves. J. J. Shaw discovered that individual microseisms could readily be identified on seismographs separated by as much as two miles, and then travel across the country studied in detail. The most interesting fact thus brought to light was that at a given station they seemed invariably to come from the same direction whenever they occurred at all When the distance between stations was increased to 8 or 10 miles, however, the individual micros could not be traced from station to station.

The great Russian seismological organization did a vast amount of valuable work under Galitzin, but with the death of its famous leader and the political revolution, it gradually went out of existence. Seismological work in Russia was recommenced at several stations in 1923 Galitzin improved the Milne seismograph almost out of recognition, producing the best such machine yet devised. The much less elaborate and less expensive instrument devised by J. J. Shaw is but little inferior to Galitzin's.

The International Seismological Association was dissolved in April, 1922. A section of the International Geodetic and Geophysical Union of the International Research Council, organized in 1919, is devoted to seismology. The first meeting was held at Rome in 1922 and the second at Madrid in 1924.

The following eminent seismologists died during the decade: Prince Boris Galitzin, May 4, 1916; J. Perry, Aug. 5, 1920; G. W Walker, Sept. 6, 1921; C G. Knott, Oct. 26, 1922; Fusakichi Omori, Nov. 8, 1923, and Otto Klotz, Dec 28, 1923.

Bibliography. New books of importance on seismology were: C Davison, *A Manual of Seismology* (Cambridge Press, 1921); G. W Walker, *Modern Seismology* (London, 1913); B Galitzin, tr. O. Hecker, *Vorlesungen uber Seismometrie* (Leipzig, 1914); O. Klotz, *Seismological Tables* (Ottawa, 1916); H. O. Wood, *A List of Seismologic Stations of the World* (Washington, 1921). SERAFIN, TULLIO (1880–). An Italian conductor, born at Cavarzere. After graduation from the Milan Conservatory he joined the orchestra at La Scala as viola player. His successful début as conductor, with *Aida* in Ferrara, resulted in his engagement for the Teatro Regio in Turin, where he remained till 1908, when he succeeded Toscanini as principal conductor at La Scala in Milan. In 1914–15 he was at the Carlo Felice in Genoa, in the summer of 1915 in Havana, and during the winter of 1915–16 at the Opera Real in Madrid. He then served in the Italian army, and after his return was once more at the Teatro Regio in Turin until 1921, when he went to the San Carlo in Naples. In the fall of 1924, he was engaged for the Metropolitan Opera House, New York. He made frequent appearances as guest conductor in Paris, London, Rome and Buenos Aires. He ranks with the foremost operatic conductors of the world.

SERBIA. Formerly a Balkan kingdom with an area of 36,937 square miles. In December, 1918, it was proclaimed a part of the new Unitary State of the Serbs, Croats, and Slovenes (Jugo-Slavia). See JUGO-SLAVIA for matters pertaining to population, industry, trade, finance, etc.

History. The murder at Sarajevo of the Archduke Francis Ferdinand and his consort on June 28, 1914, as the result of the plotting of a group of Bosnian Serb students, was succeeded by a silence that, at first by the optimistic, was regarded as a hopeful augury. It was impossible that the unfortunate event should be in any respect interpreted as having had the official support of the Serbian government. But the ultimatum of July 23 dispelled all hopes that Austria-Hungary meant to treat the question in a charitable light. The onerous terms imposed, the refusal to accept the offers of mediation tendered by the other powers, and even the rejection of the Serbian reply which indicated a willingness to concede most important points under discussion, indicated that the Dual Monarchy meant to precipitate a conflict. On July 28, Austria-Hungary declared war on Serbia. Thenceforth Serbia's destiny was not her own. Ever at the mercy of an Austro-German thrust on the one hand, and playing the rôle of a tool of a vacillating Allied policy on the other, it was inevitable that Serbia should be racked by the horrors of war perhaps more cruelly than any other combatant. Serbia was encouraged to stand up against the Austrian army with the promise at first of Russian assistance, and then Allied aid from Saloniki. Neither came, with the result that Serbia was crushed There were temporary successes at first. The Austrian army was thrown back across the Save and Drina Rivers in August, 1914, again in September, and once again in December. The last victory was a Pyrrhic one. Exhausted by the effort, and in the grip of a typhus epidemic which swept away a quarter million of Serbs, the nation was compelled to remain quiescent throughout the whole of 1915. Meanwhile the machinations of the Allied diplomats tended to aggravate Serbia's position rather than to relieve it. To encourage Italy's and Bulgaria's entry into the War, promises were made that cut squarely across Serbia's interests. From the Italian point of view a united Jugo-Slav state spelled danger; for the conciliation of Bulgaria large concessions in Macedonia had to be offered. A greater neglect, however, was the failure to support Serbia from the military point of view With Bulgaria's entry into the War on the side of the Central Powers, a great Austro-German-Bulgarian enveloping offensive was launched in October, 1915. In a few weeks Serbia, unaided, was completely conquered and the military and civil populations were compelled to flee to the south and the west Corfu became the temporary capital of the fugitive government while Serbia was divided between Austria and Bulgaria (by December 14). Bulgaria went so far as to declare that Serbia no longer existed and proceeded to enroll Serbs in her army, confiscate the land, and institute the Bulgar language. Thousands were deported for work in enemy countries. Serb history at Corfu during the three years of exile is a mélange of party jealousies. There could be no democratic representation; cliques shouldered one another in an attempt to gain what little prestige there was in heading a meaningless government. On Feb. 12, 1918, a parliament met at Corfu, but its accomplishments were little. Serb patriots were up in arms against Jugo-Slav patriots; to the day of the Armistice it was impossible to foretell whether the aspirations of the Serbs, Croats and Slovenes were ever to be realized. For the events of 1918–24, see JUGO-SLAVIA.

SERBS, CROATS, AND SLOVENES, KINGDOM OF. See JUGO-SLAVIA.

SETON, JULIA (1862–). An American lecturer and writer, born at Chicago. She was graduated from the Medical Department of the Denver-Gross College in 1898, and took postgraduate courses at Tufts Medical College. She practiced medicine in Denver and in Boston, and began metaphysical healing in the latter city in 1904. In 1906, she removed to New York City and there founded the New Thought Church and School. She lectured in the principal cities of the United States and in Europe, and wrote *Concentration—The Secret of Success* (1907); *Marriage* (1914); *The Race Problem* (1914); *Adrienne Le Baron,* a novel, (1915); *Destiny,* a novel, (1917); *The Outside and Inside of Life,* and *The Self in Tune.*

ŠEVČIK, OTAKAR (1852–). A Bohemian violinist (see VOL. XX). In 1921, he taught a master class at the Ithaca Conservatory of Music, and in 1922–23, a similar class at the Chicago Musical College Not less than 700 of his pupils became teachers or orchestral performers in the United States alone. During his stay in this country he put the finishing touches to his life work, a complete method for the violin, from the first rudiments to the last degree of virtuosity. The first section, *School of Intonation* (15 parts and two supplements, with English, German and French text) was published at New York in 1922; the printing of the second section, *School of the Virtuoso* (12 parts) was begun in the spring of 1924. Judging from the published portion, the work is not only the most voluminous and comprehensive of its kind, but seems destined to live as a lasting monument to the genius of one of the world's greatest teachers.

SEWERAGE AND SEWAGE TREATMENT. Where a high degree of sewage treatment is considered necessary, main reliance is most commonly placed on oxidation by means of sprinkling filters, also known as trickling or percolating filters, preceded by more or less treatment and in some cases followed by further treatment. Since, say, 1916, the activated-sludge process has been coming to the front in England, the United States, and Canada and has been taken up in a small way in India.

Rational Control of Water Pollution. Much attention was given to the classification of streams and other natural bodies of water with a view to putting regulations designed to prevent pollution on a more rational basis than formerly. A notable example of this is afforded by the report on the pollution of boundary waters between the United States and Canada, made in 1918 by the International Joint Commission created many years earlier by a treaty between Great Britain and the United States. The waters involved include the Great Lakes, the Rainy, St. Mary's, St. Clair, Detroit, and Niagara Rivers and to some extent the St. Lawrence as well. The studies were conducted by eminent engineers, chemists, and bacteriologists in official and private life in the United States and Canada. The report recognizes that the utilization of rivers and lakes to receive the sewage of cities is a legitimate and proper function so long as this can be done without menace to public health or the creation of nuisances by offense to sight and smell, and also that the amount of sewage which may properly be discharged into adjacent waters by any city should be determined by a careful study of all governing local conditions, including particularly whether or not public water supplies would be endangered by the sewage, and if so the permissible burden on water treatment plants. This burden, the report states, should not exceed 500 bacteria of the colon type per cubic centimeter as an average for the year, determined by samples taken in a manner specified in some detail. The report proposed that before discharge into the Detroit and Niagara Rivers, sewage should be treated to such a degree that the water receiving it would correspond to sewage diluted by a stream flow of four cubic feet per second per capita of contributing population. In Pennsylvania the Sanitary Water Board, composed of representatives of State departments having to do with health, fisheries, and other aspects of the waters of the State, in 1923 divided the streams of the State into three general classes, according to degrees of pollution and uses to which the streams are put, and established general principles to control their pollution. These principles were in general accord with those followed quite recently by the State Department of Health in passing on plants for sewage treatment. The New Jersey Legislature of 1924 created a Sanitary and Economic Water Commission. In 1922 the Pennsylvania and New Jersey Departments of Health divided the interstate portion of the Delaware River into three zones and laid down conditions as to the degree of sewage treatment that each department would require, in passing on plans for sewage works in each zone. In Great Britain, through what appears to be cooperative work carried on by the Ministries of Agriculture, Fisheries, and Health, the rivers were divided into three classes: (1) those sufficiently pure to support a considerable stock of fish; (2) those polluted but nevertheless still containing a great number of fish; (3) rivers grossly polluted and containing few if any fish. It was expected that further control of stream pollution through the joint efforts of these Ministries would take this classification into account. For preliminary report of the Steinman Committee on River Pollution, see abstract in London *Surveyor*, Jan. 11, 1924.

Sewage Treatment. For preliminary treatment of sewage and also where it is necessary to do little but remove some of the heavier and coarser solids, bar screens, grit chambers, and fine screens are employed, either singly or in combinations of two or more. Additional solid matter may be removed by sedimentation, either with or without sludge digestion. The latter is used to reduce the volume of solids for final disposal and may be effected in separate sludge digestion tanks, receiving the sludge from either plain settling tanks or from septic tanks, although the latter as originally designed were intended to effect both sedimentation and sludge digestion in one tank. Two-story septic tanks of either the Travis or Imhoff type, in which the sludge is retained for digestion in the lower chamber, are the most widely used type, particularly the Imhoff tank in Germany and the United States. In England a few Travis tanks are used, but for the most part either the one-story tanks, plain settling or septic, are employed, except that chemical precipitation is still used in several places where it was installed many years ago. Sludge from the various tanks, other than chemical precipitation, is generally de-watered to a considerable degree by placing it on sludge-drying beds consisting of sand above and gravel below, with underdrains in the latter. Chemical precipitation sludge is generally de-watered by filter presses.

Chemical precipitation fell off rapidly after the one-story septic and Imhoff tanks came into use. With the completion of an installation of Imhoff tanks under construction at Worcester, Mass., in 1924, Providence, R. I., would be the only city of considerable size in the United State and one of a very few of any size in that country still employing chemical precipitation

which never gained such a foothold in America as it did in England. Where tank treatment, with or without previous screening, is insufficient, the most common method of further treatment is by sprinkling it onto beds of coarse material and letting it percolate or trickle through the beds over the particles of filter media, which are generally broken stone in the United States and either stone or cinders in England. Large total areas of sewage film are thus exposed to contact with the air, and bacterial reduction by oxidation is effected. Sewage sprinklers in the United States are generally of the fixed nozzle type, while in England some form of moving distributor is more commonly used, consisting of perforated pipe either in the form of revolving arms or else mounted at each end and moved forward on wheels running on tracks on each side of the bed.

Activated-Sludge Process. In the activated-sludge process, the sewage, either as it comes to the works or else after preliminary treatment to remove some of the solid matter, is passed through tanks at the bottom of which are either porous plates or perforated pipes through which air under low pressure is discharged upward. A considerable amount of sludge is allowed to accumulate and is retained in these tanks. The compressed air raises the sludge, keeps it in suspension, and causes the whole mass of sewage and sludge, teaming with bacterial life, to "boil." From the activation tanks, the liquid portion of the sewage and a part of the sludge are drawn to settling tanks. From these tanks the clarified liquid or final effluent is drawn off and sent to the stream or other body of water chosen to receive it. If the sludge, i.e. solid matters highly diluted with water, is to be utilized as a fertilizer basis, then the moisture must be reduced to 10 per cent. Owing to various difficulties encountered, de-watering has presented more problems than was expected at the outset. These problems could hardly be regarded as having been solved to the general satisfaction of engineers in 1924, although some of the larger plants under construction were proceeding on the basis that sludge could be satisfactorily de-watered and probably ultimately sold as a fertilizer base. About 20 cities in the United States and seven in Canada had activated-sludge plants in operation up to the middle of 1924, and four additional plants were projected for early construction in Canada.

Various Large Projects. When the Chicago Sanitary District completed its programme it would have altogether seven sewage works of various types and combinations of types designed to treat the sewage of Chicago and vicinity so that it might continue to be discharged into the Chicago Drainage Canal and passed on down through the Desplaines and Illinois Rivers to the Mississippi without creating a nuisance. These works were made necessary by the large growth in population since the diversion of the sewage from the Lakes, accomplished in 1900, and because up to 1924 the district had not succeeded in getting authorization from the Federal government to use as much diluting water as the original plans contemplated, was still in litigation with the Federal government and several States, and was faced with protests from Canada on the subject of diversion. Late in 1923, Philadelphia officially opened its northeast sewage works, consisting of 32 Imhoff tanks and 80 sludge-drying beds with a rated capacity of 60,000,000 gallons a day. Ultimately this plant was to have a capacity of 250,000,000 gallons a day to serve a population of 300,000 people. Philadelphia's southwest plant was under contract in 1924 and its southeast plant projected. The three plants were to have a total capacity of 800,000,000 gallons daily. Baltimore had a large installation of settling and separate sludge digestion tanks and sprinkling filters. In New Jersey, the Passaic Valley sewerage district, including Newark, Paterson, and many other municipalities, expected to have its project of sewage collection and disposal, long under construction, completed and in use in 1924. The project included a trunk sewer from Paterson to a point on the Newark Meadows, a pumping plant and settling tank on the Meadows, and a tunnel beneath Newark Bay and the Bayonne peninsula and into New York Bay. Los Angeles was building a new trunk outlet sewer to a point on the Pacific coast at Hyperior, a screening plant there, and an ocean outlet in 1924.

SEYFFERT, LEOPOLD (1888–). An American artist, born at California, Mo. He studied at the Pennsylvania Academy of Fine Arts and, after winning two foreign scholarships, continued his artistic education in Paris and Spain. In 1912 he gained the fellowship prize of the Pennsylvania Academy of Fine Arts, a gold medal of the Art Club of Philadelphia in 1913, a silver medal at San Francisco in 1915, the Hallgarten prize in 1916, the Altman prize in 1917, the Beck gold medal in 1918, the Temple gold medal in 1921, and the Proctor prize in the same year. His work is represented in several of the most important art galleries in the country.

SEYMOUR, CHARLES (1885–). An American educator and historian, born at New Haven, Conn. He was graduated from Cambridge University in 1904 and from Yale in 1908, taking postgraduate courses at the latter and in Paris. In 1911, he was appointed instructor in history and in 1918 professor of history at Yale. At the Peace Conference in Paris in 1919, he was chief of the Austro-Hungarian Division of the American Commission to Negotiate Peace, and was also delegate on other commissions dealing chiefly with the Balkans. Among his writings are: *Electoral Reform in England and Wales* (1915); *The Diplomatic Background of the War* (1916); *How the World Votes* (with D. P. Frary, 1918); *Woodrow Wilson and the World War* (1921). He edited, with Col. E. M. House, *What Really Happened at Paris* (1921).

SHACKLETON, SIR EBNEST (1874–1922). An English Arctic explorer (see VOL. XX). From 1914 to 1916 he went on an Arctic explor-

ing trip, although he had offered his services to England the moment the War broke out. In 1919, at Archangel, his knowledge proved invaluable in providing comforts to the soldiers there. In 1921 he undertook his last Arctic voyage, which was to be a 30,000-mile journey in the south Atlantic and the Antarctic. He died off the whaling point Grytviken on South Georgia Island and was buried there in a coffin made by Norwegian whalers. By a strange chance Grytviken had been the jumping-off point of his 1914 expedition. See POLAR RESEARCH.

SHALE OIL. See CHEMISTRY, ORGANIC.

SHALIAPIN (CHALIAPINE), FEODOR IVANOVITCH (1873–) A Russian dramatic bass, born at Kazan. Without any preliminary musical training, he became, in 1890, a member of the chorus of a traveling light opera company, whose director immediately was struck by the exceptional beauty and power of his voice and soon entrusted him with leading rôles. In 1892–93, he studied systematically with Usatov in Tiflis, and during the summer season of 1894 he made his début in grand opera at the Maryinsky Theatre in Petrograd, where he remained two years. In 1896, he joined Mamontov's Private Opera in Moscow, whence his reputation, especially as an unsurpassed interpreter of Russian national types, rapidly spread all over Europe. His first appearances at the Metropolitan Opera House, New York (1907–08) did not arouse unusual enthusiasm, probably because he had no opportunity of singing his famous Russian rôles, but when, on his second visit, he appeared as Boris Godunov (Dec. 9, 1921), his success was overwhelming. Likewise, his recitals drew capacity houses. Later he became an annual visitor, dividing his time between the Metropolitan Opera House and the Chicago Civic Opera Company.

SHANDAKEN TUNNEL. See TUNNELS; AQUEDUCTS.

SHANNON, CHARLES HAZLEWOOD (1865–). An English painter (see VOL. XX). In 1918 he became vice president of the International Society of Sculptors and Gravers. His later works include "The Embroidered Shawl" (1918) and the lithographs, "Ebb Tide" (1917); "The Tidal River" (1919); "A Sharp Corner" (1919). He also painted several portraits, including those of Princess Patricia of Connaught, Lillah McCarthy, and Hilda Moore ("The Lady in Black").

SHANNON, EFFIE (?–). An American actress, born at Cambridge, Mass. She began to act at 10 years of age, as Eva in *Uncle Tom's Cabin*, and appeared as an ingenue in many popular plays. She played with Rose Coghlan in *Diplomacy*, with Herbert Kelcey in *The Moth and the Flame, His Lord and Master, The Thief*, etc. She took part in *The Years of Discretion* under the direction of David Belasco during 1913–14 and played in *Children of Earth* in 1915. She also appeared in *Under Orders, Mama's Affair, The Detour*, etc.

SHANNON, FREDERICK FRANKLIN (1877–). An American clergyman and author, born in Morris County, Kan., and educated at Harvard University. He was ordained to the Methodist ministry in 1899, and after preaching in West Virginia and in Grace Church and the Reformed Church on the Heights in Brooklyn, N. Y., he became pastor of the Central Church in Chicago in January, 1920. His writings include: *The Soul's Atlas and Other Sermons* (1911); *The New Personality* (1915); *The Enchanted Universe* (1916); *The Breath in the Winds* (1918); *God's Faith in Man* (1919); *The Economic Education; The Land of Beginning Again; The New Greatness.*

SHANTUNG. A Chinese maritime province; area 55,970 square miles; estimated population, 25,810,000. Shantung first entered upon western attention in 1898 when Germany extorted from China a 99-year lease of Kiaochow Bay with a surrounding area of 193 square miles, as well as large commercial concessions in the hinterland. The German policy was consistently enlightened. A railway was built (the Tsingtau-Tsinan line), a postal service established, and work was carried on in afforestation, the checking of floods, the building of roads and harbors. Schools were founded as well as eleemosynary institutions, the attitude of the Germans toward the Chinese being always amiable if paternalistic. On Aug 23, 1914, in compliance with the terms of the Anglo-Japanese Alliance, Japan declared war on Germany and moved immediately on Kiaochow. Troops were landed outside the leased area in the Shantung peninsula, in violation of Chinese neutrality; the Shantung railway was seized, and an attack by land and sea was launched against the powerful fortifications of Tsingtau. The city capitulated November 7 and three days later the leased territory of Kiaochow was formally taken over by Japan, with a view, ostensibly, to its eventual restoration to China. Upon this promise the Chinese looked with misgivings; their suspicions received confirmation only too soon, when in 1915, China was compelled to comply with the celebrated "21 Demands" (see CHINA). As regards Shantung, the demands called for: (1) Chinese agreement in advance to any understanding Japan might effect with Germany respecting German interest and concessions in Shantung; (2) an engagement on the part of China not to lease or cede to any other power any territories in Shantung; (3) Chinese consent to the building of a Japanese railway connecting Chefu or Lungkow with the Tsingtau-Tsinan railway; (4) a promise from China to open certain important cities and towns in the province for the residence and commerce of foreigners. Chinese protests were unavailing. The terms of the ultimatum were written into a treaty and a series of notes interchanged on May 25. By these China accepted the abovementioned engagements, while Japan, in recognition of Chinese counter-claims, pledged herself to return the leased territory of Kiaochow to China "if upon the conclusion of the present war, the Japanese government should be given an absolutely free disposal of the leased territory of Kiaochow Bay." The preoccupation of Europe with the War, Japan used to her further advantage. In 1917, by a series of secret treaties with the Allies, Japan forced the definite guarantee of her economic interests in Shantung. China's virtual consent was received when, on Sept. 21, 1918, the Chinese government entered into a formal agreement with Japan on these matters and accepted 20,000,000 yen. The whole matter, however, had previously been complicated by the entry of China into the War on the side of the Allies.

The general interest in Shantung, as the Peace Conference sat, was one of the most cu-

rious phenomena of this period. The Japanese, their representatives could say, sought no more than the French and British already possessed in China, i.e. economic exploitation of designated areas, while their demands encompassed less than a complacent world willingly granted to Great Britain, France, Italy, and Greece, in Africa, Asia Minor, and the Pacific Too, they had reduced a formidable fortress in Tsingtau, and this they looked on as one of the spoils of war. To liberal opinion, in England, but in America particularly, the despoiling of China meant a cynical repudiation of the lofty purposes of the War. Japan took her stand on secret treaties; moreover, China was not an enemy but an ally, even if a tardy one. It was pointed out, by Americans, that Japanese proximity to China rendered the problem not so much one of economic aggression as of political submergence. About this position President Wilson's objections to the Shantung cession were formed. For a long time he resisted the pressure of the Peace Conference, and it was only the withdrawal of Orlando and the fear of complete disruption of the proceedings by the alienation of the Japanese, that on Apr. 30, 1919, he gave a reluctant consent. Kiaochow Bay was to go to Japan by the treaty; but the Japanese delegates orally assured Mr. Wilson of their intention subsequently to return the leased territory to China. Accordingly, articles 156–158 of the Versailles Treaty transferred to Japan the German lease of Kiaochow Bay, as well as all German mining and railway concessions and other German property or rights in Shantung. These clauses gave Japan virtual, though not legal, sovereignty over the leased area, and economic sovereignty over the whole province.

In the United States disapproval of these terms was expressed in one of the 15 reservations which the American Senate adopted in November, 1919 (though not by the necessary two-thirds) with regard to the treaty. Reservation six ran. "The United States withholds its assent to Articles 156, 157, and 158, and reserves full liberty of action with respect to any controversy which may arise under said articles between the Republic of China and the Empire of Japan." China, for her part, emboldened by American sympathy, refused signature to the Treaty of Versailles and adopted a policy of passive resistance, ardently patriotic Chinese students taking the lead in the popular outcry against what they considered a national disaster. A popular boycott against Japanese goods spread so rapidly that at one time Japan's trade with China was reduced 80 per cent. This opposition, reinforced by Anglo-American pressure, compelled the Japanese government to employ more amicable methods toward China During 1920 and 1921 Japan repeatedly tried to open negotiations on the basis of the restoration of Chinese political rights in return for non-political concessions to Japanese interests. China, however, was adamant. China had not been a party to the treaty and was therefore not bound by its terms, was the substance of the Chinese position. Matters stood at this stage when the Washington Conference (q.v) assembled. The problem was still too much an American concern for the Conference to attempt to neglect or circumvent it. Japanese and Chinese representatives, delegated to discuss the matter, found a solution difficult, if not impossible. The meetings for a time reached a complete halt on the question of control of the Shantung railway, which, in effect, implied general economic control Only as a result of the mediation of Mr. Hughes and Mr. Balfour was an understanding effected and a separate Sino-Japanese agreement signed, Feb. 4, 1922. The treaty meant a complete triumph for China and a vindication of at least one of the idealistic principles of the War. Its provisions called for the restoration of the leased territory of Kiaochow to China with all German or Japanese public properties therein; the withdrawal of Japanese troops and gendarmes from Shantung, the sale of the Tsingtau-Tsinanfu Railway with all its branches and all its properties to China for the sum of 53,406,141 gold marks (about $12,700,000); during the five years allowed for payment the railway was to have a Japanese traffic manager and Japanese and Chinese chief accountants of equal rank Other sections called for the reëstablishment of a Chinese customs house at Tsingtau and for the creation of a Chinese company (in which Japanese capital might not exceed the amount of Chinese capital) for the operation of the mines of Tsechuan, Fangtse, and Chinling-Chen. By December, 1922, Japan had evacuated the province. The influence of the settlement was shown by the fact that the French offered to return Kwang-Chou-Wan and the British Wei-Hai-Wei on the basis accepted for the Shantung restoration.

The period of Chinese occupation, 1923–24, justified, in one sense, the highest hopes entertained for it, and in another, displayed lamentable weaknesses. A militarist of the old school, General Hsiung, was appointed director-general, i.e. mayor, of Tsingtau; the head of the finance department was accused of diverting funds to Peking, the administration of the wharves, the most important single source of income for the city, was woefully inefficient; the young foreign-educated Chinese were discriminated against openly. On the other hand, material progress was marked. The police were efficient; the roads were kept in good repair; afforestation went on rapidly. On the Shantung Railway, a Chinese staff, made up of returned students, replaced the Japanese, and operation was so successful (business was 15 per cent greater than in the previous year) that for the year 1923–24 profits were sufficient to pay the interest on the money due the Japanese.

SHANTZ, HOMER LEROY (1876–). An American botanist, born at Kent County, Mich. He was graduated from Colorado College in 1901 and took postgraduate courses at the University of Nebraska. He was instructor of botany and zoölogy at Colorado College and instructor of botany at the University of Nebraska and the University of Missouri In 1907, he was appointed professor of botany and bacteriology at the University of Louisiana. He served as special agent in the United States Bureau of Plant Industry, and from 1910 to 1919 was plant physiologist in charge of physiological and fermentation investigations. He was a member of many scientific societies and contributed articles on botany to scientific journals and publications of the United States government. He was agricultural explorer for the Smithsonian Institution African Expedition in 1919–20, and carried on other explorations in Africa.

SHAPLEY, HARLOW (1885–). An American astronomer, born at Nashville, Mo. He studied at the University of Missouri, and took his Ph.D. at Princeton in 1913. In 1914, he became astronomer at Mt. Wilson Observatory of the Carnegie Institution, remaining there until 1921 when he accepted the directorship of the Harvard Observatory. His original investigations were devoted to studies in photometry and spectroscopy, as well as to the orbital theory and computation on which he contributed important papers to the literature of astronomy.

SHARLOW, MYRNA DOCIA (1893–) An American dramatic soprano, born at Jamestown, N. D. Having studied piano and voice at the Beethoven Conservatory, she continued her vocal studies with F. E. Bristol (1911–13) and with E. Clément in Paris (1914). Her operatic repertory she acquired under Campanini, Moranzoni, Weingartner and S. Wagner She made her début with the Boston Opera Company as Stella in Offenbach's *Contes d'Hoffmann* (Nov. 25, 1912) and sang with that organization until 1914 From 1915 to 1921 she was a member of the Chicago Opera Association, and again in 1923. In 1914, she appeared at Covent Garden. She is gifted not only with a glorious voice, but is also a splendid actress. Her favorite rôles are Tosca and Brünnhilde in *Siegfried* In 1921, she married Edward B. Hitchcock.

SHARP, WILLIAM GRAVES (1859–). An American diplomat (see VOL XX). He was a member of Congress from Ohio from 1909 to 1914, resigning in the latter year following his appointment as ambassador to France in which office he served until 1919. He was elected a Foundation member of the Société Astronomique de France, having been a lifelong student of that science. He was awarded the Grand Cross and Legion of Honor in recognition of his services as ambassador.

SHARPE, HENRY GRANVILLE (1858–). An American army officer, born at Kingston, N. Y., and graduated from the United States Military Academy in 1880. Most of his official employment was in the commissary department. He had charge of the relief of flood sufferers at Cairo, Ill., and Memphis, Tenn., in 1897, and was on duty in Porto Rico in 1898 and in the Philippines from 1902 to 1904. He was in France in 1919. He wrote: *The Art of Subsisting Armies in War; The Art of Supplying Armies in the Field as Exemplified during the Civil War; The Provisioning of the Modern Army in the Field; The Quartermaster Corps in the Year 1917 in the World War* (1921).

SHAW, GEORGE BERNARD (1856–). An English author and dramatist (see VOL. XX). In 1914 he wrote *Common Sense About the War*, which was so outspoken as to offend many, and throughout the War he aroused considerable irritation by what was considered untimely defense of the Germans and fault-finding with the Allies. Other later books were: *How to Settle the Irish Question* (1917); *Peace Conference Hints* (1919); and the plays: *O'Flaherty V.C., The Inca of Perusalem* (1915); *Augustus Does His Bit* (1916); *Heartbreak House* and *Annajanska* (1917); *Back to Methuselah*, a cycle of five plays (1921); *Jitta's Atonement* (1922); and *Saint Joan*, which was played in New York City in 1924.

SHAW, JAMES BYRNIE (1866–). An American mathematician, born at Remington, Ind. He studied at Purdue University. During 1890–98, he was professor of mathematics at Illinois College, and later held a similar chair at Kenyon. From 1903 to 1910, he was professor of mathematics at the James Milliken University, and in the latter year was called to the University of Illinois, where in 1918 he became professor. Professor Shaw made a specialty of algebra, particularly of multiple and linear associative algebra, on which he contributed important papers to mathematical journals. In addition to many papers, he wrote *Synopsis of Linear Associative Algebra* (1907), and *Lectures on the Philosophy of Mathematics* (1918).

SHAW, J(OHN) W(ILLIAM) (1863–). An American Roman Catholic Archbishop, born at Mobile, Ala. He was educated at the Academy of the Brothers of the Sacred Heart at Mobile, and at St Finian's Seminary in Ireland. He studied also at the University of the Propaganda at Rome, and was ordained to the priesthood in 1888, becoming assistant in the Cathedral at Mobile, and assistant and missionary in St Peter's Church, Montgomery, Ala., and, in 1891, rector of the Cathedral of Mobile and chancellor of the diocese. In 1910, he became Coadjutor Bishop of San Antonio, Texas, and in 1911 Bishop. In 1918, he was consecrated Archbishop of New Orleans.

SHAW, THOMAS (1872–). An English labor leader, born at Colne, Lancaster. He began work in a cotton mill when but eight years old. He was self educated, mastering French and German so thoroughly that he was one of the most skillful interpreters at the international labor conferences which he attended. He was one of the ablest speakers in the English labor movement, and possessed a thorough knowledge of industrial problems. Ramsay Macdonald appointed him Minister of Labor.

SHEEP. See LIVE STOCK.

SHELFORD, VICTOR ERNEST (1877–). An American zoölogist, born at Chemung, N. Y. He was educated at the University of Chicago. He was assistant in zoölogy (1900–01) at West Virginia University; assistant (1904–07), associate (1907–09), and instructor (1909–14) in zoölogy at the University of Chicago; assistant professor (1914–20), and associate professor (1920–) at the University of Illinois, and biologist in charge of the research laboratories of the Illinois Natural History Survey (1914–). He has been active in developing research on ecology and has published *Animal Communities in Temperate America* (1913).

SHELL. See PROJECTILE.

SHERRILL, CHARLES HITCHCOCK (1867–). An American lawyer and diplomat, born in Washington. He was graduated from Yale in 1889 and from the Law School of that university in 1891. He practiced law in New York for several years and in 1909 was appointed minister to Argentina. He served until 1911, when he was obliged to resign from the diplomatic service on account of ill health. In 1912, he resumed the practice of law. He was active in athletics and was the originator of several series of national and international sports. During the War, he served as brigadier-general and adjutant-general of the State of New York in charge of the United States draft. He is the author of *Stained Glass Tours in France* (1898); *Stained Glass Tours in Italy*

(1913); *French Memories of Eighteenth Century America* (1915); *Modernizing the Monroe Doctrine* (1916); *Have We a Far-Eastern Problem?* (1920); *The Purple or the Red* (1924).

SHERRINGTON, SIR CHARLES SCOTT (?–). A British physiologist educated at Cambridge, including a degree in medicine in 1892. He was professor of physiology in the University of Liverpool from 1895 to 1913 and resigned to accept his present chair of Waynefiete professor of physiology at Oxford. He was also formerly Brown professor of pathology in the University of London. He is best known for his researches into the repair of nervous tissue and his major works have been *The Integrative Action of the Nervous System* (1906), and *Mammalian Physiology* (1916). He was knighted in 1922.

SHIPBUILDING AND NAVAL ARCHITECTURE. The design and construction of naval vessels, as well as of merchant craft, fall under this head. They are extensively treated under NAVIES OF THE WORLD and VESSEL, NAVAL. On Jan. 1, 1924, the steady decline in merchant shipbuilding which had been going on since the peak was reached in 1919–20, was still evident. General shipping conditions improved considerably from June 30, 1922, to June 30, 1923, and there had been some gain since that time; but the business and financial conditions throughout the world were not such as to lead to great extension of maritime trade and the demand for more ships. Nearly 7,000,000 tons of shipping were laid up on June 30, 1923 and until much of this was absorbed into active fleets, no great amount of construction could be expected. The total shipbuilding in the various countries of the world in 1922 was 2,467,084 tons, and in 1923, 1,643,181 tons. The tonnage launched in 1923 was less than half of that launched in 1913 and about two-thirds the annual average for the 10 years preceding the War. The launchings in the various countries of the world in the years from 1914 to 1923 are shown in Table I

United States. The Shipping Board and Emergency Fleet Corporation (see the article SHIPPING) began to rush the work of acquiring shipping as soon as the latter was formed and organized in 1917. Contracts were let during the summer and autumn of that year to all shipbuilding companies in the United States to the full amount of their capacities, in some cases to an amount necessitating an extension of their facilities. Late in November, 1917, the Board announced that contracts had been let for 884 new vessels aggregating 4,724,300 tons; that 426 vessels of 3,029,508 tons had been requisitioned on the ways and their construction accelerated; and that contracts were pending for 99 vessels of 610,000 tons. Of the vessels ordered, 379 had wooden hulls; keels had been laid for 166, of which 130 were in yards which did not exist when the contracts were let. The wooden hulls were ordered from 72 yards, 51 of which were new; and the 58 composite ships were given to 4 yards, 3 of which were new. Contracts for the steel ships were awarded to 32 yards, of which 20 were new. Four of the newly ordered ships, 2 of steel and 2 of wood, were launched before the end of the year; and of the requisitioned ships, 49 were launched and completed. In accordance with a special provision of the Urgent Deficiency Act of June 15, 1917, the Shipping Board's Emergency Fleet Corporation awarded contracts for the construction of three government-owned shipyards designed for building fabricated steel ships. These contracts were made with the Submarine Boat Corporation for a plant on Newark Bay, with the American International Corporation for one at Hog Island near Philadelphia, and with the Merchants' Shipbuilding Company for one at Chester, Pa. The yards were to cost $35,000,000 and the government was given an option to purchase the lands on which they were situated. The builders of the yards were given contracts for building in them 200 ships, but further contracts greatly increased the total as well as the capacity and equipment of the yards. In addition, the government furnished money for the extension of private yards, dry docks, etc., and spent about $80,000,000 for housing operations and for purposes of transportation. The total investment of the government in shipbuilding facilities was estimated at $211,000,000. Under the pressure of necessity, new vessels were laid down in constantly increasing numbers; and the construction of vessels in hand was accelerated as far as practicable. One steel vessel of 3500 tons was launched at the Ecorse Yard of the Great Lakes Engineering Works in 14 working days from the time of laying the keel, completed in 29 days; and 34 days after the keel was laid it steamed away in charge of a United States Shipping Board crew. The extraordinary accomplishments of the Fleet Corporation in 1917 and 1918 are shown in Table II.

TABLE II.—WORK OF EMERGENCY FLEET CORPORATION IN 1917 AND 1918 IN DEADWEIGHT TONS

	No.	Deadweight tons	Equivalent in completed tonnage
1917			
Vessels delivered	49	301,809	301 809
Launched but not delivered	57	403,502	322,802
On the ways	391	1,908,735	190,873
Total in 1917			816,484
1918			
Vessels delivered	526	2,983,977	2,983,977
Launched but not delivered	287	1,222,873	978,298
On the ways	391	1,939,225	646,408
Work done on ships begun in 1917	391	1,908,735	445,372
Total in 1918			5,054,055

Immediately after the signing of the Armistice, the Shipping Board began to curtail its programme. Contracts for new work were canceled as far as practicable. The reductions in work thereby entailed were largely offset by

orders given by American corporations on private account and consisted nearly 50 per cent of tankers, in which the Shipping Board programme was inadequate

Foreign Shipbuilding. In Great Britain, the necessity for building cargo ships to replace the waste in the War was realized as soon as the amount of tonnage withdrawn for naval use became known; and this necessity was rendered more urgent by the submarine campaign of 1915. Some steps were taken in that year to increase the amount of shipbuilding, but skilled labor was scarce, as much of it had been diverted to munitions factories, indeed, parts of

MOTOR VESSELS

COURTESY "MOTORSHIP", NEW YORK

1. MOTOR BARGE "TWIN PORTS," built for Lake, Canal, and River Service, Great Lakes to New York Harbor.
2. AMERICAN MOTOR SHIP "CALIFORNIAN," 16,500 tons displacement, 4500 I. H. P., speed 12 knots. Built by Wm. Cramp & Sons Ship & Engine Bldg. Co., Philadelphia.
3. BRITISH MOTOR SHIP "GLENOGLE," 12,500 tons displacement. Two Diesel Engines of 3000 I. H. P. Built by Harlan & Wolff, Belfast.

shipbuilding establishments had been turned into munitions works. In December, 1916, the Ministry of Shipping was established, and definite plans made to expedite building were carried into effect in 1917. Five types of "standard" ships of 3000 to 8000 tons were designed, and they were followed by "fabricated" ships for which new shipyards were built. These measures were fairly successful, but the lack of workmen kept down the output. Of the other nations, France and Italy were unable to speed up commercial work; this left the United States and Japan as the only countries, aside from Great Britain, which could materially aid in the supply of new ships.

Types of Ship. The necessity of rapid production during the War brought out some new types of cargo ships, such as fabricated ships, standard ships, welded ships, and concrete ships. The ideas involved were not new, but opportunity for their development on a large scale had not hitherto existed A few standard designs were made and many ships of each design constructed. The hulls, machinery, and fittings were exactly alike, so that scores of each plate, frame, casting, forging, etc., could be made at one time and place, thereby greatly reducing the cost, as in other sorts of standardization. Fabricated ships are standard ships in which the lines of the hull are simplified and straightened as far as practicable. This makes it possible for most of the frames and plates to be shaped, cut, and, to some extent, riveted in shops equipped for bridge and structural iron-work The reduced number of frame and plate shapes effected a great saving in labor and time, and some saving was made in riveting, shaping, and transportation. The Isherwood system is a system of longitudinal framing, i.e. one in which the longitudinal frames are continuous and the transverse frames worked in sections between them. Sir Joseph Isherwood devised a modification of the existing system in which was utilized the whole of the framing of the bottom of the ship and of the decks so that it might be incorporated as part of the structural girder strength of the ship. This system, first used in 1908, greatly increased in importance during the War, and 250 ships of nearly 2,500,000 tons were built in accordance with it in 1918. Welded ships are vessels in which welding is used to replace a great part of the riveting and some of the calking. While this had not yet become a popular method of ship construction in 1924, the experiments made were promising. Vessels of armored concrete had been in use for many years, and a number were built by the Shipping Board. As they were not very popular among shipping men and were not mentioned in late lists of the decade 1914–24, it is presumed that they were sold or otherwise disposed of.

Propelling Machinery. In cargo vessels designed to operate in those parts of the world where adequate repair shops are few and far between, the reciprocating steam engine was still in 1924 the favorite with owners who do not, for various reasons, find the Diesel engine suited to their work. Reciprocating engines had been in use for such a great length of time that perfection of the type in regard to reliability, simplicity, and ease of ordinary repair are strong points in their favor. But they lack economy of operation and have too great machinery weights and space, particularly in weight and space of fuel, as compared with engines of recent types. For vessels of moderate size and speed, particularly for those covering long routes, Diesel engines were becoming more and more popular. But in new passenger steamers of high and medium speed, the latter type carrying large cargoes, the geared steam turbine was almost invariably fitted, although a few such steamers had been ordered with new-type Diesel machinery.

Oil Fuel. The use of oil in place of coal as the fuel for marine boilers was being continually extended. Practically all new passenger steamers had oil-fired boilers. While the actual cost of oil fuel per ton mile is greater than that of coal, the economies effected by its use more than counterbalance this. The space occupied by the boilers is less. Oil can be carried by tanks located in spaces not suitable for cargo. The detestable work of coaling ship is avoided, and most of the necessary time and expense for that work is saved. The number of men in the boiler rooms is reduced by half. As oil fuel is 50 per cent more efficient than good steaming coal, the weight saved by its use, as well as the space, can be devoted to cargo or passengers. The principal objection to the use of oil was that in many ports of the world it was difficult to obtain. This objection was being largely obviated.

Turbines. In the early types of turbine engines, the turbines were directly connected to the propeller shafts. This necessitated low turbine speed or high propeller speed, neither arrangement economical. To enable the turbines to operate at their most efficient speed, which is high, and at the same time to drive propellers of the most desirable size and pitch at the proper speed, the turbines are fitted to deliver their power to the propeller shafts through gearing. Nearly all turbine machinery of late construction was of the geared type. The economical speed of the turbines is adjusted by the gears to the designed sea speed of the vessel; at lower speeds the economy is relatively less. The principal difficulty experienced with geared turbines is the pitting, wearing, and breaking of the gear teeth, and this increases with age.

Electric drive was devised to overcome the same difficulties connected with efficient turbine and propeller speeds that brought forth the geared turbine. The turbines drive electric generators furnishing current to motors on the propeller shafts. This arrangement permits of economical operation at all ordinary speeds, an important advantage in ships of war. For this and other reasons all recent battleships of the United States Navy and the large battle cruisers, which were scrapped by the Five Power Pact, were fitted with electric drive; but in light cruisers and smaller vessels, and in the merchant service, geared turbines are almost universally preferred.

Motor Ships and Diesel Engines. The most serious competitor of the geared turbine and indeed of all other types of steam propelling machinery is the heavy-oil internal-combustion engine of the Diesel or modified Diesel type. For machinery of 6000 horse power or less, it seems likely to at least divide popularity with the reciprocating engine. The earlier engines were mostly single-acting and of the four-stroke cycle type. Large four-stroke cycle double-acting engines of 10,000 brake horse power were

constructed in 1924. But recent great improvements in two-stroke cycle engines caused them to take the lead so that on Jan. 1, 1924, much more than half of all the motor ships building in Great Britain were of the two-stroke cycle type. To give greater mechanical simplicity and to reduce further the first cost of the propelling machinery, which had averaged about 10 per cent greater than steam equipment of the same power, double-acting two-stroke cycle engines with port scavenging were engaging the attention of designing engineers. A considerable number of ships equipped with such engines were in service in 1924, and many others were under construction. Another direction in which design was tending toward greater simplicity was the substitution of solid, or mechanical, injection of the fuel in place of air injection. In the quarter ending June 30, 1923, 52 steam vessels of 148,123 tons and 18 motor vessels of 90,515 tons were laid down in Great Britain and Ireland; in the same quarter, 6 steamers of 16,800 tons and 3 motor ships of 6000 tons were laid down in the United States; in all countries, 202,515 tons of steamers and 107,015 tons of motor ships. Since June 30, 1923, the proportion of motor ships laid down has still further increased. The United Shipping Board was removing the steam machinery and fitting Diesel engines in four comparatively new steamers and intended to transform about 50 others in the same way. The increasing demand for motor ships was causing many European owners to effect similar transformations. The largest motor ship laid down up to 1924 was the Union Castle passenger liner building at the yard of Harland and Wolff in Belfast, Ireland. The dimensions are: length, 630 feet; beam, 73 feet; tonnage (gross), 20,000. The propelling machinery consisted of two sets of double-acting, 8-cylinder Diesel engines of some 20,000 indicated horse power. The designed sea speed was 18 knots. See ELECTRIC SHIP PROPULSION.
